- Environmental measures by the state government and the statutory authorities must anticipate, prevent and attack the causes of environmental degradation.
- Where there are threats of serious and irreversible, lack of scientific certainty should not be used as a reason for postponing measures to prevent environmental degradation.
- The onus of proof is on the actor or the developed industrialist to show that his action is environmentally benign.[13]

In a later case,[14] the court elaborated the new concept of burden of proof and observed that it is to be noticed that while the inadequacies of science have led to the precautionary principle. The

[12] (1996) 5 SCC 647.
[13] Id at 658.

said Precautionary Principle in its turn has led to the special principle of burden of proof in environmental cases where burden as to the absence of injurious effect of the change the status quo. This is often termed as a reversal of the burden of proof because otherwise in environmental cases, those opposing the change would be compelled to shoulder the evidentiary burden, a procedure which is not fair. Therefore, it is necessary that the party attempting to preserve the status quo by maintaining a less polluted state should not carry the burden of proof and the party who wants to alter it must bear this burden. The Precautionary Principle suggests that where there is an identified risk of serious or irreversible harm, it may be appropriate to place the burden of proof on the person or entity proposing the activity is potentially harmful to the environment.[15]

The Supreme Court in the Bichhri case[16] held that polluter pays principle to be a sound principle and observed that- 'We are of the opinion that any principle evolved in this behalf should be simple practical and suited to the conditions obtaining in this country.' The court further observed that the polluter pays principle demands that the financial costs of preventing or remedying damage caused by pollution should lie with the undertaking which caused the pollution or produce the goods which caused the pollution. Under the principle, it is not the role of the government to meet the cost involved in either prevention of such damage or in carrying out remedial action, because the effect of this would be to shift the financial burden of the pollution incident to the taxpayer.[17] The Supreme Court went on to categorically enshrine the principle as a sound law in the Vellore Citizens' case and observed that the Polluter Pays and Precautionary Principles have been accepted as part of the law of the land. Article 21 of the Constitution of India guarantees protection to life and personal liberty.[18] The court further observed that even otherwise, once these principles are accepted as part of the customary International Law, there would be no difficulty in accepting them as part of the domestic law. It is almost an accepted proposition of law that the rule of customary International law which is not contrary to the municipal law shall be followed by the courts of law.[19]

The Public Trust doctrine primarily rests on the principle on the principle that certain resources like air, sea, water and forests have such a great importance to the people as a whole. Hence, it would wholly unjustified to make them a subject of private ownership. The said resources, being a gift of nature should be made freely available to everyone irrespective of their status in life. The doctrine enjoins upon the government to protect the resources for the enjoyment of the general public rather than to permit their use for private ownership or commercial purposes. The Indian Legal System has inclined this spirit in its understanding of the principle. In the Span

Motels case,[20] the Supreme Court held that our legal system, based on English common law includes the public trust doctrine as part of its jurisprudence. The state is the trustee of all natural resource, which are by nature meant for public use and enjoyment. Public at large is the beneficiary of the seashore, running waters, air, forests and ecologically fragile lands. The state as a trustee is under a legal duty to protect the natural resources. These resources meant for public use cannot be converted into private ownership.[21] Consequently, in an attempt to enhance the effective use of the principle, the court further held that the public trust doctrine was a part of the law of the land.[22]

The Supreme Court in the Ganesh Wood Products case[23] recognized the obligation of the present generation to preserve natural resources for the next and future generations. The court relied on the principle of inter-generational equity and explained that intergenerational equity means the concern for the generations to come. The present generation has no right to imperil the safety and well-being of the next generation or the generations to come thereafter.[24] In the judgement, the court quoted from the report of the World Commission on Environment and Development as- 'Environmental protection and sustainable development must be an integral part of the mandates of all agencies of government, of international organisations and of major private sector institutions. These must be made responsible and accountable for ensuring that their policies, programs and budgets encourage and support activities that are economically and ecologically sustainable both in the short and long terms.'[25] The Supreme Court[26] further emphasized in a significant principle that stringent action ought to be taken against defaulters and persons who carry on industrial or development activity for profit without a regard for environmental laws. The court further observed that we are also of the view that the tendency of raising unlawful construction in the entire country and such activities are required to be dealt with by firm hands. Such unlawful constructions are against public interest and hazardous to the safety of occupiers and residents of multi-storied building.[27]

The exercise of inherent powers of High Court under Section 482 of the Criminal Procedure Code depends upon the peculiar facts and the circumstances of each particular case. The Supreme Court in the case of M.C Mehta v. Union of India,[28] in a question raised by Pollution Control Boards relating to quick obtaining of stay orders from High Court under Section 482 of the Criminal Procedure Code, 1973 held that – "It is submitted before us that whenever the Board constituted under the Water Act, 1974 initiated any proceedings to prosecute industrialists

or other persons, who pollute the water in the river Ganga, the persons accused of the offense immediately approach the High Court and obtain stay orders thus frustrating the attempts of the Board to enforce the provisions of the Water Act. They have not placed before us the facts of any particular case. We are however, of the view that since the problem of pollution in the water of river Ganga has become very active, the High Court should not ordinarily grant orders of stay of criminal proceedings in such cases and even if such an order of stay is made in any extraordinary case, the High Courts should dispose of the case within a short period, say about 2 months from the date of institution of such a case. We request the High Courts to take up for hearing all the cases, where such orders have been issued under Section 482 of the CrPC, 1973 staying prosecution under the Water Act within 2 months. The counsel for the Board constituted under the Water Act shall furnish a list of such cases to the Registrar of concerned High Court for appropriate actions being taken therein."[29]

The Supreme Court has further applied the principle of sustainable development in several cases. The application of the sustainable development theory arose in the Ganesh Wood Products v. State of Himachal Pradesh.[30] The decision in Vellore Citizens' Welfare Forum v. Union of India[31] was the first decision in which the Supreme Court discussed the principle of sustainable development in detail. In that case, the court was agitated over the matter of polluting tanneries in Tamil Nadu. In response to the contention that the industries could not be shut down given the contribution of leather tanneries to the economy, the court held that while industries are vital for the country's development, but having regard to pollution caused by them, the principle of sustainable development is to be adopted a balancing concept. Though the leather industry is of vital importance to the country as it generates foreign exchange and provides the employment avenues, it has no right to destroy ecology, degrade the environment and pose a health hazard.[32] More significantly, the Supreme Court pointed out the basic concepts of sustainable development and this has since subsequent law making in this regard held that the traditional concept that development and ecology are opposed to each other is no longer acceptable. It has come to be accepted that internationally, as a viable concept to eradicate poverty and improve the quality of human life while living within the carrying capacity of supporting ecosystems. Essential features of sustainable development are the Polluter Pays Principle and the Precautionary Principle.[33]

Conclusion

An active judiciary may adopt various means to meet the growing needs of a society. The judiciary has not only served to improve the dynamism of the existing laws but also of its jurisprudence. Environment protection is a classic example in this direction. The Indian Judiciary has earned an excellent record in the creation of environmental rights in India and its

[29] Id at 127.

[33] Ibid.

contribution to the jurisprudence of environmentalism has provided an example for everyone, all over the world.

As discussed, the judiciary has adopted, applied, evolved and derived a range of principles to guide the development of environmental jurisprudence. Yet the country has not achieved much. It may be because the judiciary has entrusted the enforcement and compliance totally to the government machinery. People's participation is the most important aspect, which is being so far neglected in the process of environment and compliance. If people's participation could have been enveloped in the enforcement and the compliance, the situation could have been much better than today.

SCHEDULED TRIBES UNDER INDIAN LEGAL SYSTEM: AN ANALYSIS

Dr.Shalini Kashmiria
Assistant Professor,Department of Laws,
Himachal Pradesh University, Shimla, India.

Abstract: The term Scheduled Tribes refers to community of specific indigenous people whose status as such is recognised under the Constitution of India, 1950. The primary criterion adopted for delimiting Indian backward communities as STs include their traditional occupations of a whole range of tribal modes of life which is reflected in their language, customs, traditions, religious beliefs, arts and crafts, archaic traits, occupational pattern and economic development According to the 2011 census, the number of scheduled tribes in India is 10,42,81,034 which is 8.6 per cent of the total population. Approximatly 9,38,19,162 people belonging to Scheduled tribes live in rural India and 1,04,61,872 resides in urban India. In India, there exist labyrinth of laws for the protection of STs namely the Constitution of India,1950 Articles 15,16 17 , 19, 43,338,340-342 along with schedule V and VII.Beside this there exist independent Commissions,Ministry and Acts exclusively dealing with the overall development of Scheduled tribes such as National Commission for Scheduled Tribes,MOTA, TAC,PESA1996,The Scheduled Tribes and Traditional Forest Dwellers (Recognition of Forest Rights) Act, 2006, Scheduled Castes And The Scheduled Tribes (Prevention Of Atrocities) Act, 1989 and so on. Despite activism shown by legislative and administrative authorities still there exist issue of upliftment of ST population in India .The present research work is based on secondary methods of study. The secondary methods are based upon a collection of material from various sources such as the government surveys, reporters, Indian and foreign journals, International Conventions, research articles, newsweeklies, newsletters, internet, books newspaper clippings and various cases on the subject etc. The present research paper will try to critically analyse the limitations of existing statutory provisions and procedural implications and will explore legal possibilities of making amendment.

***Key words*:** Commissions, MOTA, TAC, Indigenous People, Backward Communities, Scheduled Tribes

1.INTRODUCTION

In India Scheduled Tribes represent a group of tribal communities which were designated as STs during the post independence period under The Constitution of India , 1950. In simple terms ST refers to marginalised communities of specific indigenous people demarcated on the basis of geographical isolation and not based on caste system. A collective term used generally to describe these people is '*upajati'* (clans/groups/tribes). The primary criterion adopted for delimiting STs in India include their traditional ancestral occupational pattern which they have inherited and their tribal mode of life reflected in their language, customs, traditions, religious beliefs, arts and crafts, archaic traits, and economic development[1]**.** As per National Law Commission for Scheduled Tribes the Scheduled Tribes are notified in 30 States/UTs and the number of individual ethnic groups notified as Scheduled Tribes is 705.[2]According to the 2011 census, the number of scheduled tribes in India is 10,42,81,034 which is 8.6 per cent of the total population. Approximatly 9,38,19,162 people belonging to Scheduled tribes live in rural India and 1,04,61,872 resides in urban India.[3]**.**

2.CONCEPT

Indian Constitution also known as the fundamental law of land aims at securing for all its citizens socioeconomic justice, equality of status and opportunity, thereby assuring the dignity of the individual. Part XIX Article 366(25)[4] of the Constitution, 1950 defines Scheduled Tribes as *'such tribes, tribal areas and tribal communities that are deemed as Scheduled Tribes under Article342'*[5].

2.1 Who will be included in Scheduled Castes and Scheduled Tribes

Although Constitution of India does not define as to 'who' belongs to Scheduled Castes and Scheduled Tribes but empowers the President of India to draw up a list of these Castes and Tribes under Article 341 and 342.. Under Article 341[6] the President, after consultation with the Governor of the concerned State will specify the races, castes or tribes or of groups within these races, castes or tribes for purpose of their notification Scheduled Tribes and if such notification is concerning a state, then the Governor of the State has to be consulted. Any inclusion or exclusion from the Presidential notification of any race, caste or tribe can only be done by the Parliament by enactment of law. If any question arises with respect to status of a particular tribe as a tribe under Article 341, public notification issued under Article 340(1)[7] has to be taken into consideration. Further Article 342[8] explains the scope of Scheduled Tribes and provides that the President after consultation with the Governor with respect to a State or Union Territory (UT) by public notification specify the tribe/tribal community/part of/group within tribe or tribal community to be the STs in relation to that State/UT as the case may be. Further, the Parliament, by enactment of law is empowered to include or exclude any tribe/tribal community from the list of Scheduled Tribes[9]. Articles 330 to 342 of Constitution of India provides for special provisions for safeguarding the interest of Scheduled Tribes.

2.2 Bodoland Territorial Areas District

It is to be noted that a new provision has been added after Article 332 (6) by the Constitution 90th Amendment Act 2003[10]. which provides that the representation of Scheduled Tribes included in the Bodoland Territorial Areas District shall not affect the representation of Scheduled Tribes and Non – Scheduled Tribes in the Legislative Assembly of the State of Assam. Further the Constitution 79th Amendment Act, 1999[11] has substituted the word 'fifty' with the word 'sixty' in Article 334[12], thus extending the reservation of seats for Scheduled Tribes in the Lok Sabha and in the state assemblies up to 60 years from the commencement of the Constitution. Although seats are reserved but they are elected by all voters in the constituency. So there is no separate electorate Scheduled Tribes. As per Article 325 there shall be one general electoral roll which clarifies that a member of a Scheduled Tribe may contest any seat other than reserved also.

3.SCHEDULED AREAS

'Scheduled Areas' means such areas as the President may by order declare to be Scheduled Areas[13]. The President of India is empowered to take the following steps for protection of interest of ST population

- The President can pass an order that whole or part of Scheduled Area shall cease to be a Scheduled Area only after consultation with the Governor of the concerned State/ UT.
- The President of India can increase or decrease the boundaries of Scheduled Areas.
- The President is also empowered to declare any territory not previously included in any State or UT to form part of a Scheduled Area.

In India, there exist labyrinth of laws for the protection of STs and the same have been mentioned as follows

13 See Schedule Fifth, Para 6 of the Constitution of India, 1950.

3.1The Constitution of India, 1950

Fundamental rights

Part III of the Constitution which deals with Fundamental Rights are basic human rights in consonance with the Universal Declaration of Human Rights carrying the theme of 'dignity of the individual'. They are enforceable and justifiable in nature against the State and its officials. Under Part III Articles providing safeguards to the ST population are:

Article 15[14]–Prohibition of Discrimination on grounds of religion, race, caste, sex or place of birth.

Article 15(1)[15] prohibits the State government from discriminating against citizens of India on grounds of religion, race, caste, sex, place of birth or any of them in the matter of rights, privileges and immunities .The right is conferred on a citizen as an individual and is available whenever there is a case of discrimination against him/her.

Article 15(2)[16] provides that there shall be no discrimination by the State and the private individuals against a citizen on the grounds mentioned under Article 15(1) from access to public places which includes shops, public restaurants, hotels, places of public entertainment and use of public places such as wells, tanks, bathing '*Ghats*', places of public resorts maintained wholly or partly by State fund.

Article 15(3)[17] empowers the State government to make special provisions for the protection of women and children which includes STs as well.

Article 15(5) was added by the 3rd Constitution Amendment Act 2005[18] provides for reservation in favour of STs in Private Educational Institutions whether aided or unaided by the State, except the minority educational institutions as defined under Article 30(1).

Article 16[19] – Equality of Opportunity in the Matter of Public Employment

Article 16(1) and 16(2) apply only in respect of employment or office under the State government and lays down that there shall be no discrimination against any citizen for any employment or office under the State on grounds of religion, race, caste, sex, decent, place of birth or residence but it is subjected to certain exceptions as mentioned under Article 16(3),16(4),16(4 – A)[20],and 16(4 – B)[21] Article 16(4 – A) added by the 77th Constitution Amendment Act, 1995[22] empowers the State to reserve seats in matters of promotions for STs if the State is of the opinion that they are not adequately represented in the Services under the State. It is to be noted that Article 16(4 – B) seeks to end the 50 per cent limit for Scheduled Castes, Scheduled Tribes and Other Backward Classes in backlog vacancies which could not be filled up due to the non – availability of eligible candidates of these categories in the previous year(s).

Article 17[23] – Abolition of Untouchability

Article 17 of the Constitution abolishes "untouchability" and forbids its practice in any form and makes it punishable in accordance with law. In pursuance of Article 17 the Parliament has enacted the Untouchability (Offences) Act, 1955 which was amended in 1976 . Presently it is renamed as the Protection of Civil Rights Act[24], 1955.

Article – 19[25] Right to Freedom Article 19(1)[26] of the Constitution guarantees to the citizens of India the following six fundamental rights namely:

a. Freedom of Speech and Expression subjected to reasonable restrictions as provided under Article 19(2).,
b. Freedom of Assembly subjected to reasonable restrictions as provided under Article 19(3).,
c. Freedom to form Associations subjected to reasonable restrictions as provided under Article 19(4).,
d. Freedom to Move Freely Throughout the Territory of India; subjected to reasonable restrictions as provided under Article 19(5).,

26 See Articles 19(1) of the Constitution of India, 1950.

e. Freedom to Reside and to Settle in any Part of the Territory of India and subjected to reasonable restrictions as provided under Article 19(5).,

f. Freedom to Practice any Profession, Occupation, Trade or Business subjected to the restrictions as mentioned under Article 19(2). subjected to reasonable restrictions as provided under Article 19(6).,

Directive Principles Of State Policy

Part IV of the Constitution of India deals with the Directive Principal of State policy which although are not enforceable but are justifiable in the governance of the country. These principles comprise of certain Social, Economic and Political principals, suitable to peculiar conditions prevailing in India. Article 46[27] which comes within the preview of the Social Security Charter enjoins upon the State to promote with special care the education and economic interest of the weaker sections of people in particular of Scheduled Tribes and also to protect them from social injustice and of all forms of exploitation.

3.2National Commission for Scheduled Tribes

History

Several provisions have been incorporated in the Constitution with the motive to safeguard the interests of Scheduled Tribes. Further with the objective of effective implementation of these safeguards it is must to appoint Commissioner of SCs and STs under article 338. The Commissioner must directly report the affairs of their working to the President of India. For effective working of office of the Commissioner 17 regional offices of the commissioner have been setup across the country followed by establishment of a multi-Member Commission named as Commission for Scheduled Castes and Scheduled Tribes w.e.f 21st July 1978 which was renamed as National Commission for Scheduled Castes and Scheduled Tribes w.e.f 1st September 1987. It is a national level advisory body to advice on policy matters and levels of development of SCs and STs and submits its report directly to the Central government. The Commission was given Constitutional status by the 65th Amendment to the Constitution dated 12th March 1992 and the office of the Commissioner was abolished .Later the Government of India felt that geographically and culturally ST population differs from SC population so do their problems. So they constituted separate Ministry of Tribal Affairs in October 1999 for coordinating all the activities relating to the ST population in India [28] followed by the Constitution 89th Amendment Act, 2003[29] which amended Article 338 and added a new Article 338 – A (1)[30] providing for the establishment of National Commission of Scheduled Tribes. Earlier the Constitution 65th Amendment Act, 1990 amended Article 338 (a) thereby providing for National Commission for Scheduled Castes and Scheduled Tribes.

The Commission is empowered to regulate its own procedure under Article 338(4)[31] Moreover the commission shall function by holding the sittings and meetings at any place within the country and also through its officers at the Headquarters and in the Regional offices and carries following activities namely:

- Procedure of investigation and enquiry by the Commission;
- Meetings of Commission and their frequency;
- Duties of the Regional offices ;
- Advisory role of commission ; and
- Monitoring functions.

Constitution of Commission

The Commission shall consist of a Chairman, Vice – Chairman and three other members. The members of the Commission shall be appointed by the President. The conditions of service and tenure of the members of the Commission shall be such as the President may by rule determine for Scheduled Tribes.[32] The headquarter of the commission is located at New Delhi.

Duties of the Commission [33]

The following are the duties of the Commission:

- Investigating and monitoring of all matters relating to the safeguards for STs under the Constitution and in any other law or any order of Government and to evaluate the working of such safeguards.,
- Inquiring into specific complaints with respect to the deprivation of rights and safeguards of STs.,

27 See Articles 46 of the Constitution of India, 1950.
28 For details see Constitution 89th Amendment Act,2003.
29 For details see Constitution 89th Amendment Act, 2003.
30 See Articles 338 – A(1) of the Constitution of India, 1950.
31 See Article 338(4) of the Constitution of India,!950.
32 See Article 338—A(2) of the Constitution of India, 1950.
33 See Article 338—A(5) of the Constitution of India, 1950.

- Participating in the planning process of socio-economic developments of STs and to evaluate the progress of their development under the Union and any State.,
- Present to the President reports upon the working of those safeguards annually and at such other times as the Commission deems fit.,
- Making recommendations as to the measures that should be taken.,
- Discharging such other functions as required for the welfare, development and advancement of the Scheduled tribes.

  Moreover the commission shall function by holding the sittings and meetings at any place within the country and also through its officers at the Headquarters and in the Regional offices.

Powers of the Commission [34]

While investigating any matter the Commission shall have the powers of a civil court as provided under the Civil Procedure Code,1908 trying a suit in respect of the following manners namely-

- Summoning and enforcing the attendance of any person from any part of India and examining him on oath.,
- Discovering and production of any document.,
- Receiving evidence on affidavits.,
- Requisitioning any public record or copy from any court or office.,
- Issuing commission for the examination of witness.,

For the purpose of investigation and inquiry the commission may adopt any one or more of the following methods

- By the commission directly.,
- By an investigating team constituted at the headquarter of the commission.,
- Through its regional offices.

It is mandatory for the Union and the State Government to consult the Commission on all the major policy matters affecting Scheduled Tribes. The commission is authorised to maintain the confidentiality of any matter. All summons and warrants issued by the commission in capacity of civil court shall bear the seal of commission. Legal process shall be issued from the legal cell of the commission. For the service of the legal process the provisions of the Code of Civil Procedure,1908 for the legal process shall be followed.

Advisory Role of the Commission[35]

The Commission through its members, secretariat and regional offices shall interact with the state government and the planning commission at regular intervals of time by way of representations concerning the process of planning ,development and evaluation of all the programmes and schemes concerning the Scheduled Tribes. The secretariat of the commission through its concerned wings would provide necessary assistance and information to the member-in-charge of the concerned State / Union territory.

Other functions of the Commission

The commission shall undertake surveys and evaluation studies in collaborations with the Central or State Government or the Universities or Research bodies by constituting study teams comprising of professionals either at the Headquarters or at the Regional Offices so as to evaluate the impact of developmental schemes on the socio economic development of the Scheduled Tribes. The studies undertaken are compiled in the form of Annual or Special Report of the Commission.

3.3The Provisions of the Panchayats (Extension to the Scheduled Areas) Act 1996 [hereafter referred to as PESA, 1996[36]

The PESA Act, 1996 provides for the extension of the provisions of the Part IX of the Constitution relating to the establishment of Panchayats to the Scheduled Areas under Section 4[37] subjected to the following exceptions-

- The State legislation on Panchayats which is to be implemented in Scheduled Areas must be in consonance with the customary law, social and religious practices and traditional management practices of the areas concerned.,

34 See Article 338—A(8) of the Constitution of India, 1950.
35 For details see National Commission for Scheduled Tribes, Handbook 2016.
36 For details see PESA Act, 1996.
37 For details see section 4 of PESA Act, 1996.

- Village for the application of PESA Act,1996 must consist of a habitation, group of habitations or a hamlet or group of hamlets comprising a community managing its affairs according to its traditions and customs.,
- Every village shall have a Gram Panchayat consisting of persons whose names are included in the electoral roll.,
- Every gram sabha shall be competent to safeguard traditions and customs, cultural identity, community resources sand customary mode of dispute resolution.,
- The reservation of seats in the scheduled areas at every panchayat shall be in proportion to the population of the communities in that panchayat for whom reservation is sought to be given of constitution provided that all the seats of the Chairpersons of the Panchayats at all levels shall be reserved for the Scheduled Tribes. Moreover it is mandatory that half seats shall be reserved for the STs out of the total number of seats.,
- The State government is empowered to nominate persons from tribal community having no representation in Panchayat at the intermediate level or district level provided such nomination shall not exceed one –tenth of the total number of members to be elected in that panchayat.,
- Panchayat shall perform the function of planning and management of the minor water bodies in the scheduled areas at the appropriate level and must be consulted before making any acquisition of land in scheduled areas for developmental projects, re settling and rehabilitation projects.,
- Recommendations of gram sabha and panchayats at the appropriate level shall be mandatory before granting any mining lease or license in the scheduled areas or grant of concession for the exploitation of minor minerals by auction.,

Powers of the Panchayats and Gram Sabhas with respect to the scheduled areas

- Power to enforce prohibition, to regulate or to restrict the sale and consumption of any intoxicant.,
- Ownership of minor forest produce.,
- Power to prevent alienation of land in scheduled areas .,
- Power to manage village markets.,
- Power to exercise control over money lending in scheduled Tribes.,
- Power to exercise control over institution and functionaries in all social sectors.,
- Power to control over local plans and resources and tribal sub plans.,and

3.4The Scheduled Tribes and Traditional Forest Dwellers (Recognition of Forest Rights) Act, 2006.

Chapter II Section 3[38] of the said Act deals with forest rights of forest dwelling scheduled tribes and other traditional forest dwellers which are as follows-

- Right to hold and live in the forest land under individual or common occupation for habitation or for self cultivation for livelihood by member (s) of forest dwelling scheduled tribes
- Community rights such as nistar including those rights which were used in princely states and zamindari regimes.,
- Right of ownership, collect, useand dispose of minor forest produce.,
- Communities rights of entitlements such as fishery, other products of water bodies , grazing and traditional resources access to pastoralist and nomadic communities.,
- Communities tenures of habitatand habitants for primitive tribal groups andpre- agricultural communities.,
- Rights over disputed lands under any nomenclature in any state where claims are disputed.,
- Rights of conversion of pattas or leases or grants issued by any local authority or any state government on forest lands to titles.,
- Rights of settlement and conversion of all forest villages, old habitations, unsurveyed villages and other villages in forests whether recorded , notified or noted into revenue villages.,
- Right to protect, regenerate or conserve or manage any community forest resource which they have been traditionally protecting for sustainable use.,

[38] See section 3 of The Scheduled Tribes And Other Traditional Forest Dwellers (Recognition of Forest Rights)Act,2006

- Right of access to biodiversity, intellectual property and traditional knowledge related to biodiversity and cultural diversity.,
- Any other traditional right customarily enjoyed by forest dwelling scheduled tribes and other traditional forest dwellers.,
- Right to in situ rehabilitation including alternative land in cases of illegal eviction or displacement from forest land of scheduled tribes and other traditional forest dwellers.,

CHAPTER V Sections 7 and 8 of the Act deals with offences and penalties. Section 7[39] provides that if any authority or committee or officer or member of such authority or committee contravenes any of the provision of this act or any rule made there under shall be guilty of an offence under this act and shall be punished with fine extending to one thousand rupees. Section 8[40] provides that no court shall take cognizance of any offence under section 7 unless any forest dwelling schedule tribe in case of a dispute relating to a resolution of a gram sabha or the gram sabha through a resolution against any higher authority gives a notice of not less than sixty days to the State Level Monitoring Committee and the later has not proceeded against such authority.

3.4 The Scheduled Castes And The Scheduled Tribes (Prevention Of Atrocities) Act, 1989

This Act was enforced on 11th September 1949 with the objectives of prevention of atrocities against the members of Scheduled Castes and Scheduled Tribes, for the establishment of special court for the trial of such offences and providing for the relief and rehabilitation of the victims of such offences,
Section 3[41] of the act deals with the kinds of atrocities against the scheduled tribes-

- Forcing a member of Scheduled Tribe to drink or eat any inedible or obnoxious substance.,
- Acts with the intention to cause injury, insult , annoyance to the member of Scheduled Tribes and to parade him naked or with painted face or body or to commit any similar act derogatory to human dignity.,
- Wrongfully occupying or cultivating any land which is owned by, allotted to, notified by any competent authority to the Scheduled Tribes or gets the land allotted to him transferred.,
- Wrongfully disposing a member of the scheduled tribes from his land or premises or interferes with his enjoyment of any land , premises or water.,
- Compels or entices a member of Scheduled Tribes to be a beggar or other similar forced labour.,
- Forces or intimidates any member of the Scheduled Tribes note to vote or to vote to a particular candidate.,
- Intentionally insults or intimidates with the intent to humiliate a member of Scheduled tribes in any place within public view.,
- Assaults or uses force against any women belonging to the scheduled tribes.,
- Being in a position to dominate the will of the women belonging to the scheduled tribes and intentionally uses that position to exploit her sexually.,
- Corrupts or fouls the water of any spring, reservoir or any other source used by the Scheduled tribes community.,
- Denies the member of scheduled tribes any customary right to passage to a place of public resort or to obstruct such members.,
- Forces a member of scheduled tribes to leave his house, village or other place of residence.,
- Section further provides that the person committing the above mentioned offence against any member of the scheduled tribes shall be punished with imprisonment not less than six months which may be extended up to five years and fine.
- The act further provides that whoever not being the member of the Scheduled Tribes gives or fabricates false evidence intending thereby to cause or knowing it to be likely to cause any member of Scheduled Tribe[42]-
- to be convicted of an offence which is capital shall be punished with imprisonment for life and with fine and if an innocent member of the Scheduled tribes is convicted and executed ,the person responsible for it shall be punished with death.,

[39] See section 7 of The Scheduled Tribes And Other Traditional Forest Dwellers (Recognition of Forest Rights)Act,2006
[40] See section 8 of The Scheduled Tribes And Other Traditional Forest Dwellers (Recognition of Forest Rights)Act,2006
[41] See section 3(1) of The Scheduled Castes and the Scheduled Tribes (Prevention of Atrocities) Act, 1989
[42] See section 3(2) of The Scheduled Castes and the Scheduled Tribes (Prevention of Atrocities) Act, 1989

- to be convicted of an offence which is not capital but punishable with imprisonment for seven years or upward shall be punishable with imprisonment for six months which can go up to seven years and with fine.,
- commits mischief by fire or any explosive substance with intention or knowledge that such act is likely to be causing destruction of any building used as place of worship, dwelling by members of scheduled tribes shall be punished with imprisonment for life and with fine.,
- commits mischief by fire or any explosive substance with intention or knowledge that such act is likely to be causing destruction to any property belonging to any members of scheduled tribes shall be punished with imprisonment for six month which can extend up to seven years.,

Section 4 [43] further provides that if a public servant not a member of Scheduled Tribes wilfully neglects his duties, he shall be punished with imprisonment for a term of six months extendable to one year and on second conviction of any person under this act for the same offence shall be punished with imprisonment for one year which can be further extended to such duration as provided under the offence committed.[44] In order to provide speedier justice to the scheduled tribes under the Act the state government in consonance with the Chief Justice of the state concerned by official notification shall specify for each district a court of session to be considered as a special court for the offences under the act followed by the appointment of an advocate in practise for not less than seven years as special public prosecuter for conducting cases under this act [45]

4.ADMINISTRATION OF SCHEDULED AREAS AND TRIBAL AREAS

- Article 244(1)[46] provides that the Scheduled Areas and Scheduled Tribes in any State other than the States of Assam, Meghalaya, Tripura and Mizoram will be administered and controlled in accordance with the provisions of the Fifth Schedule .The Fifth schedule provides that the executive power of the State extends to the Scheduled Areas.
- Article 244 – A[47] was added to the Constitution in order to meet the demands of the hill tribes of Assam for a separate State. This Article empowers the Parliament to form an autonomous State comprising certain Tribal Areas of Assam and creates local legislature and Council of Ministers for such a State. It may by law, lay down constitution, power and functions of the legislature and Council of Ministers.

Fifth Schedule[48]

The Fifth Schedule provides that the executive power of the State shall extend to the Scheduled Areas. But the Governor has a special responsibility regarding such areas. In the sense that he/she is required to make an annual report to the President or whenever required by the President regarding administration of these areas. The Union will exercise its executive power over these areas to the extent of giving of directions to the State regarding administration of the said areas. There exists a Tribal Advisory Council in each State having Scheduled Areas, consisting of not more than 20 members as representatives of the Scheduled Tribes in the State which has no Scheduled Council. The Council shall advise on matters pertaining to the welfare and advancement of Scheduled Tribes in the State referred to them by the Governor.

Sixth Schedule[49]

The Sixth Schedule[50] of the Constitution identifies Autonomous Districts in Tribal Areas in the states of Assam, Meghalaya, Tripura and Mizoram and also recognizes Autonomous Regions within these Autonomous Districts which in turn are specified in Part I ,II, III and IIA of paragraph 20 of 6th Schedule. With respect to matters like fisheries, ferries, ponds, roads, transport, waterways, market, schools and dispensaries in the concerned district, the District or Regional Councils are empowered to make rules with the approval of the Governor and lays down its constitution and powers. These Councils are empowered to make laws for the administration of justice in the autonomous districts and the tribal areas. The Councils may constitute Village Council or Court for the trial of suits between parties belonging to Scheduled Tribes. The High Court shall have such jurisdiction over these areas as the Governor may by order specify. There is a

44 See section 5 of The Scheduled Castes and the Scheduled Tribes (Prevention of Atrocities) Act, 1989
45 See sections 15 and 16 of The Scheduled Castes and the Scheduled Tribes (Prevention of Atrocities) Act, 1989
46 See Article 244(1) of the Constitution of India,1950.
47 See Articles 244 – A of the Constitution of India, 1950.
48 For details see the Fifth Schedule of the Constitution of India, 1950.
49 For details see the Sixth Schedule of the Constitution of India, 1950.
50 For details see Sixth Schedule of Constitution of India, 1950.

District Fund to which all money received by the District Council and Regional Council shall be credited. The Governor may make rules for the management of the District Fund. The District Council and Regional Council shall have the power of imposing taxes. The Governor may by public notification direct that any Act of Parliament or of the Legislature of Assam shall apply or shall not apply to the autonomous district or region or shall apply with such modifications as he/she may specify through the notification. The Governor may annul or suspend acts and resolutions of the District Council and Regional Council if he/she is satisfied that such act is likely to endanger the safety of India or is likely to endanger public order . Moreover the Governor may take such steps as he/she may consider necessary (including suspension of Council) and assume to himself/herself all or any power(s) exercisable by the Council. It is to be noted that the Sixth Schedule may be amended by law from time to time. No such law shall be deemed to be the amendment of Constitution of India for the purpose of Article 368.

4.1 Ministries/Departments/Committees[51]

Under the Constitution the following ministries, departments and committees have been constituted for welfare and development of tribal community

- Ministry of Law and Justice
- Ministry of Minority Affairs
- Ministry of Tribal Affairs

Ministry of Law and Justice

The Ministry of Law and Justice is the backbone of the Government of India, dating back to the Charter Act, 1833, followed by Government of India Act 1919, 1935 and finally the Constitution of India, 1950. As the main source of the Indian Constitution, Statutes (legislations), Customary Laws and Case Laws, they are taken into account by the Constitution in India while administering justice in certain spheres[52].

Ministry of Minority Affairs

The Government of India, through Department Justice (DoJ) and Ministry of Law and Justice, in collaboration with United Nations Development Programme (UNDP) has implemented access to justice for marginalized people 2008 - 2017. This access to justice has been extended to the following UNDAF states namely Bihar, Chattisgarh, Jharkhand, Madhya Pradesh and Odisha with the main objective of developing strategies for breaking barriers to accessing justice to marginalized groups in legal/social and economic domains.The following are the achievements of this programme:

- Legal literacy initiatives over 20 lakh people from marginalized communities making them aware of their legal rights.
- Inclusion of legal literacy in Adult Literacy Programme under Sakshar Bharat Abhyyan.
- Training over 7,000 paralegals from various backgrounds for this purpose.
- Providing for the legal aid clinic run by the Law Schools, so as to enable a better understanding of the problems faced by marginalized communities in access to justice[53].

Ministry of Tribal Affairs[54] (MoTA)

This ministry was setup in 1999 when the Ministry of Social Justice and Empowerment bifurcated. It is the Nodal ministry for overall development of Scheduled Tribes and performs the following functions

- Work related to the welfare of tribal people such as planning , policy formation ,research and training.,
- Encouraging development of tribal people and providing them scholarships
- Protection to the interest of tribal communities with regard to land alienation
- Administration of Scheduled Ares as per the guidelines of “Fifth Schedule[55],” and “Sixth Schedule”. under Article 224(1) and Article 224 (2)

Under the Fifth Schedule the criteria for declaring any area as “Scheduled Area” include:

- Preponderance of Tribal Population,
- Size and compactness of the Area under consideration,
- Available administrative entity such as district, block or *taluk*,

---

51 List of Ministries/Departments is based on information given under Allocation of Business Rules, 1961 as amended time to time by Cabinet Secretariat, available at http://cabsec.nic.in

52 Ministry of Law and Justice, available at htt://lawmin.nic.in

53 Increasing Access to Justice for Marginalized People, available at http://www.in.undp.org/ content/india/en/home/operations/projects/democratic_governance/access_to_justice.

54 Ministry of Tribal Affairs, Government of India, available at http://www.tribal.nic.in/Content/scheduledtribes.aspx.

55 For details see Fifth Schedule of the Constitution of India, 1950.

- Economic backwardness of the Area,

It is to be noted that a particular area is specified as the Scheduled Area with respect to a State by the President's Notified Order after consultation with the concerned state government. The same is applicable to alteration, increase, decrease and incorporation or rescinding any order relating to "Scheduled Areas".

Moreover with respect to any particular Scheduled Area, the Governor of the concerned State, where the area is located, exercises the rights to prohibit transfer of land from tribal people and right to regulate the business of money lending to members of Scheduled tribes.

In addition the Governor of such a state has the power to repeal any Act of Parliament or State Legislature applicable to the area in question and can through public notification notify the authority and community concerned. He shall make an annual report regarding administration of Scheduled Areas in the State to the President.

Further the executive power of the Union Government shall extend to giving direction to the State concerned as the administration of said area.

Organizations under the Ministry

Following are the organizations under the ministry

- National Commission for Scheduled Tribes, NCST
- National Scheduled Tribes Finance and Development Corporation,NSTFDC
- Tribal Co-operative Marketing Federation of India, TRIFED

*4.2 Role Of Tribes Advisory Council[56] (***TAC)**

TAC advises the State Government on matters pertaining to the welfare and advancement of Scheduled Tribes in State as referred to by the Governor.

Composition of TAC

TAC consists of twenty members out of which 3/4th are MLAs representing the scheduled tribes. TAC can also be established with the permission of the President of India in those States where Scheduled Tribes are present and living but not demarcated Scheduled Area. Moreover, the provision of **Panchayat (Extension to Scheduled Areas) Act, 1996 [PESA][57]** contained in Part IX of the Constitution has been extended to Scheduled Areas for benefit of the Scheduled Tribes.It is to be noted that the Councils have been conferred power under the Civil Procedure Code,1908 and Criminal Procedure Code,1973 for trial of certain suits and also the power of revenue authority for collection of revenue and taxes from their areas along with additional powers to make laws with respect to other matters like secondary education, agriculture, social security and social insurance, public health, sanitation and management of natural resources.ss

Special Officer for Scheduled Castes, Scheduled Tribes etc

Article 338(1)[58] provides that there shall be a special officer for the Scheduled Castes and Scheduled Tribes to be appointed by the President. Article 338(2)[59] provides that it shall be the duty of the special officer to investigate all matters relating to the safeguards for the Scheduled Castes and Scheduled Tribes under the Constitution and submit a report concerning the working of hose safeguards at such intervals as directed by the President and the latter is under duty to cause all such reports to be laid before each house of the Parliament.

5.RESERVATION IN SERVICES.

As per Article 335[60], all the claims of the members of the Scheduled Castes and Scheduled Tribes shall be taken into consideration, in making appointments to services and posts in connection with the affairs of the Union or of a State keeping in mind the efficiency of administration. Constitution 81st Amendment Act, 2000 has added a new provision to Article 335 which provides that 'nothing' in this Article shall prevail in making of any provision in favour of members of Scheduled Castes and Scheduled Tribes for relation in qualifying marks in any examination or lowering the standard of equivalence for reservations in matters of promotion to any class or classes of services or posts in connection with the affairs of the Union or of a State.

The Constitution of India, 1950 provides for reservation of seats for the Scheduled Tribe Community in the Lok Sabha and the State Legislative Assemblies under Articles 330 and 332 of the Constitution[61].

---

56 Tribes Advisory Council, available at ://www.pib.nic.in/newsite/PrintRelease.aspx?relid=89727

57 For details see Panchayat (Extension to Scheduled Areas) Act, 1996 (PESA).

58 See Articles 338(1) of the Constitution of India, 1950.

59 See Articles 338(2) of the Constitution of India, 1950.

60 See Articles 335 of the Constitution of India, 1950.

61 See Section 330 & Section 332 of the Constitution of India, 1950.

Article 330[62] provides for reservation of seats for the Scheduled Castes and Scheduled Tribes except the Scheduled Tribes in the autonomous district of Assam[63].

Article 332[64] provides for the reservation of seats for the Scheduled Castes and Scheduled Tribes except the Scheduled Tribes in the autonomous district of Assam in the Legislative Assemblies in every State. The number of seats to bereserved in any state or union territory for such castes and tribes will be made on population basis[65]. Initially this reservation was provided for a period of ten years only but the Constitution (One Hundred Ninth Amendment) Bill, 2009[66] which has extended this time period for further ten years has been passed by both houses of Parliament, assented to by the President in January 2010 and enacted as Constitution (Ninety Fifth Amendment) Act, 2009[67].

Representation of People (Amendment) Bill, 2010 and the rights of Scheduled Tribes

It is to be noted that the rights of Scheduled Tribes are also protected by the Representation of People (Amendment) Bill, 2010 which amended the Representation of People Act of 1950[68]. The Act now provides that every citizen of India (including Tribes) whose name is not in the electoral roll or who has not acquired citizenship of any other country or who is absenting himself from his ordinary place of residence in India owing to employment, education or otherwise, or is outside India, whether temporary or not shall be entitled to have his name registered in electoral roll in the constituency named in his passport after thorough verification by Electoral Registration Officer and Central Government after consultation with the Election Commission of India.

Reservation For Scheduled Tribes In Various Kinds Of Services

The Constitution of India also provides for the reservation of seats for Scheduled Tribes in All India Services. The number of seats in direct recruitment by open competition is 7.5 per cent of the total seats.In case of Group C & D posts, the percentage of reservation for Scheduled Tribes is fixed in proportion to their population in respect of State/Union Territory, provided, total reservation of seats for them remains within the limit of 50 per cent. It is to be noted that reservation for the Scheduled Tribes in India is by mode of vertical reservation. Reservation for Scheduled Tribes is provisioned for:

- AIS (All India Services)
- PSUs (Public Sector Undertakings including Nationalized Public Sector Banks.)
- Autonomous Bodies
- Statutory Bodies
- Semi Government Bodies such as voluntary agencies receiving grant of two lakh or more from Consolidated Provident Fund and employing more than 20 persons on regular basis and at least 50 per cent of its recurring expenditure is met form grant – in – aid form Central Government.
- State governments have also provided for reservations of posts for the Scheduled Tribes[69].

---

62 See Article 330 of the Constitution of India, 1950.

63 The 51st Amendment Act clarifies that the reservation of seats in Assam Assembly for the Scheduled Tribe will be made from the entire State except the Autonomous District of Assam. Seats shall be reserved also for the Autonomous District in the Legislative Assembly of the State of Assam.

64 See Article 332 of the Constitution of India, 1950.

65 The expression 'population' refers to population as ascertained at the last preceding population census of which the relevant figures have been published. The Constitution 84th Amendment Act has amended the explanation to Articles 330 and 332 and substituted '2000' with '2026', thus the expression population means the population as ascertained on the basis of 199 census. The Constitution 87th Amendment 2003 has amended the provision to Article 330 and substituted '2001' in place of '1991'. This means that the expression 'population' for this purpose will be ascertained on the basis of 2001 census. The allocation of seats in the Lok Sabha for Scheduled Castes and the Schedules Tribes shall be frozen till the year 2026.

66 See Constitution 109 Amendment Bill, 2009.

67 See Constitution 95th Amendment Act, 2009.

68 For details see, The Representation of People Amendment Bill, 2010. Also see, the Representation of People's Act, 1950.

69 The policy of Reservation to SCs , STs and OBCs is available at http://persmin.gov.in/...Reservation.../Ch_02_2014.pdf

6.PERSONAL LAW

It is to be noted that due to diversity of population in India and very rich cultural heritage consisting of people of different religions and faith, there exist different sets of personal laws in respect of matters relating to family affairs, such as marriage, divorce, succession, adoption, wills etc. These Personal Laws are the subject matter of the Concurrent List (List III), Entry 5, Schedule 7 of the Constitution of India, 1950. Therefore, the Union Legislature and the State legislature are equally entitled to regulate it and make laws in this field[70].

Marriage

In India, the law regulating Marriage and Divorce has been subjected to different enactments based on people of different religions, castes and tribes such as:

- Divorce Act, 1869
- The Indian Christian Marriage Act, 1872
- The Kazis Act, 1180
- The Anand Marriage Act, 1909
- The Indian Succession Act, 1925
- The Parsi Marriage and Divorce Act, 1936
- The Dissolution of Muslim Marriage Act, 1939
- The Special Marriage Act, 1954
- The Hindu Marriage Act, 1955
- The Foreign Marriage Act, 1969
- The Muslim Women (Protection Rights on Divorce) Act, 1986

The marriages among the Scheduled Tribes are regulated by the Special Marriage Act, 1954[71]. This Act provides for special forms of marriages and their registration extending to all of India except the state of Jammu and Kashmir. Persons governed by this Act include the tribal communities belonging to different religious faiths. Thus marriage celebrated under any other form can be registered under The Special Marriage Act, 1954, if it satisfies the requirements of this Act. No doubt effort are being made to codify customary law which arre prevalent among Hindus by enacting the Hindu marriage Act, 1955[72]. But this Act is not applicable to the Scheduled Tribes unless the Central Government notifies in this context by notification in the Official Gazette.

Maintenance

The status of marriage automatically provides the wife the right of maintenance against her husband. Right to maintenance forms a part of the personal laws and extends not only to the wife and dependent children, but also to indigent person and divorced wives irrespective of cast, tribe and communities. Right to maintenance has been provided under Code of Criminal Procedure, 1973 (Amended) Act, 2001 [No. 50 of 2001][73] so as to make this remedy speedier and inexpensive. It is to be noted that divorced wives who had received money payable as maintenance under Cr. P.C, 1973.

The Indian Succession Act, 1925[74] provides for both intestate and testamentary succession. The Indian Succession Act 1925 (Amended) Act, 1991 applies two schemes. One relating to property of persons married under the Special Marriage Act, 1954 and the other relating to succession rights in case of intestate succession only for the Parsi Community.Finally, the Hindu Succession Act, 1956[75] [30 of 1956] extending to the whole of India except the state of Jammu and Kashmir. The remarkable feature of this Act is that now a woman can inherit an intestate equally with men and life estate of female heirs has been abolished. Recently, the Hindu Succession (Amendment) Act, 2005 was passed providing for equal share to a coparcener daughter in a joint family property.

71 For details see, Special Marriage Act, 1954.
72 For details see, Hindu Marriage Act, 1955.
73 For details see, Criminal Procedure Code, 1973 (Amended) 2001.
74 For details see The Hindu Succession Act, 1925.
75 For details see The Hindu Succession Act, 1956 (Amended) 2005.

7.WELFARE SCHEMES FOR THE SCHEDULED TRIBES

India is a welfare state working on the principal of Rule of Law and Natural Justice. Earlier the Tribal Development Division was under the Ministry of Social Justice and Empowerment but in October 1991 it was separated and made a separate Ministry with the objective of providing more focused approach on the integrated socio-economic development of the Scheduled Tribes (STs). [1]There are various schemes run by the centre government for the upliftment of schedulrd tribes namely

- Pre matric scholarship schemes for ST students.,
- Post matric scholarship schemes for ST students.,
- National overseas scholarship for ST students studying abroad.,
- National fellowship and scholarship for higher education of ST students.,
- Grant-in-aid to voluntary organizations working for welfare of STs.,
- Strengthening Education among ST girls in low literacy districts.,
- Special central assistance to Tribal Sub Schemes (TSS).,
- Grant –in-aid to tribal research institutes.,
- Development of particularly vulnerable tribal groups(PVTGs)
- Support to national/state scheduled tribe finance corporations.,
- Minor forest produce (MFP).,
- Pradhan mantra Van Dhan Yojana (PMVDY).,
- Eklavya Model Residential Schools(EMRS).,
- E-Governance initiative for ST Welfare schemes.,etc

8.CONCLUSION

Despite effective legislation and administration followed by judicial activism in cases related to tribal population in India still we are unable to achieve success in overall development of tribal communities. Major issues which are being noticed related to tribal population is low literacy rate especially among females, lack of awareness regarding their legal rights and welfare schemes, health issues as tribes usually inhabit with their cattles residing in traditional houses making use of stored water for drinking , economically weaker section of society because of less or nil knowledge about new techniques in agriculture and animal husbandary as they are still dependent on traditional methods of cultivation and breeding animals.In this context following suggestion can be made

- There should be harmony between Centre and State sponsored welfare schemes for tribal population for effective implementation .,
- Licensing system should be implemented for making use of forest wood no matter for making furniture or constructing tribal house so that everyone should be equally benefited.,
- NGO,s should come forward for carrying out community programmes for tribal people making them aware of their socio-legal rights. For this purpose legal aid cells should turn up and organize legal aid clinics on regular basis in tribal areas.,
- There should be proper transport facility provided to the tribal areas so that they are not cut from other regions of the state.,
- Household industries should be encouraged in tribal areas followed by establishment of cooperative societies and banks wherein facility for loans at lower rate and longer period of return should be provided.,
- The traditional knowledge and biodiversity of tribal communities of any form must be protected .For that the NGO,s and government must work in coordination.,
- Lastly we should remember that each tribal community is different from other in terms of their heritage and geographical conditions, thus it is mandatory for the state government to understand their needs and provide need based schemes to them.

9. AUTHORS BIOGRAPHY

Dr.Shalini Kashmiria is an Assistant Professor at Department of Laws, Himachal Pradesh University ,Shimla with a teaching experience of 13 years with specialization in Business Law.Her research papers , articles ,conference proceedings in refereed and peer reviewed national and international journals and chapters in edited book volumes have micro scale prespective mostly focused on cyber crimes, biopiracy of traditional knowledge, competition policy, IPR issues, biodiversity conservation and company law.She has active participation in national and international seminars, workshops, colloquium and is frequently invited as resource person. She has done a project on tribal communities of Himachal Pradesh in collaboration with ministry of Tribal studies ,Government of India. She has also organized an investor awareness workshop in collaboration with SEBI, Shimla Division.

HATE CRIMES IN INDIA: NEED FOR A COMPREHENSIVE LEGISLATION

Sasha Chauhan Kanwar

Assistant Professor, Department of Laws, Himachal Pradesh University, Summerhill, Shimla, Himachal Pradesh, India

Received: 27 Jul 2020 **Accepted:** 28 Jul 2020 **Published:** 31 Jul 2020

ABSTRACT

Hate crimes attack the victims not only physically but they and theirfamiliesbegin to question their very own identity causing vulnerable citizens in the country. The hate motivated crimes are not dependent on the behaviour or conduct of a person but are based on his caste, gender, religion, race etc. Hate crimes are on rise in India for the past few decades and if we do not sensitise ourselves with this crime today our future generations cannot live in peace and harmony in this heterogeneous society for very long. These hate crimes may spread beyond the individual victims to a community at large, therefore, there is an utmost need for a legislation with stringent laws and accountability of those responsible for keeping peace in the society.

KEYWORDS: *Hate crimes, Lynching, Hate Speech, Caste-Based and Gender Based Violence*

INTRODUCTION

While the term "Hate Crimes" came into existence before the mid 1980s the legislations were enacted by very few countries to deal with it. Even after the legislations being enacted and punishments being inflicted for such crimes the recent incidents of hate crimes all over the world shows that the legislations are not enough to deal with this crime.

Although the countries like United states of America and India as a matter of fact, have been following the slogans of "Unity in Diversity" or " Diversely United" they are not followed in letter and spirit. Newspapers and cable news programs broadcast a steady stream of stories about murder, hate crimes, genocide, terrorism and the mass killings of civilians—from Paris and Germany, Iraq, Yemen, and the United States. Recent news headlines have highlighted police brutalization of the African American community, and many cases of hate violence mostly on the basis of caste and religion in India.[1]

Recently on 25th May, 2020, a person named George Floyd died in the United States of America. It shows how well the legislation was constructed. One of the Police officers, the so called protectors of the lives of people, pinned down his knee on the neck of George for seven minutes which led to his death.

On 31st May, 2020, in a similar case, four persons allegedly shot dead a DalitDalit boy named Vikas Jatav after refusing him entry in a temple. The accused belonged to an upper caste.

[1]Jamshid A. Marvasti, M.D. and Anton Power,The psychology of hate and hate crimes: The story of those who refused to hate, American journal of forensic psychology, volume 35, issue 1, 2017, p 33.

RECENT CASES OF HATE CRIME IN INDIA

Tabrez Ansari

On 22nd June, 2019 a video went viral in social media where a 24 years old man identified as Tabrez Ansari was beaten for hours in Jharkhand on the pretext of theft. He was married less than two months ago and was the only support of his wife. He was being lynched by the mob and was forced to chant "Jai Shri Ram" and "Jai Hanuman."

Hafeez Mohammed Haldar

A 26 years old teacher who taught in a religious seminary was thrown out of the train in west Bengal. Hafeez Mohammad Haldar was travelling when a mob chanted "Jai Shri Ram" and pushed him out of the train. He managed to escape death with minor injuries.

Faizal Usman Khan

A 25 years old Muslim cab driver was beaten up by a group of men at night in Mumbai and was forced to chant "Jai Shri Ram".

Afrazul Khan

A Bengali-Muslim labourer, Afrazul Khan was lynched in Rajasthan. In a viral video a man is seen hacking Khan to death with a pickaxe. The attacker made the video himself and accused the victim of *love jihad*. He then set Khan on fire.

There are numerous other cases where a Dalit was killed because he entered a temple, or he rode a horse to his wedding, he grew a moustache, he drew water from a local well, for eating in front of upper caste people, for marrying a person from an upper caste, for sitting cross legged in front of upper caste people, for bathing in a lake etc.

Even if we hold numerous rallies of "Black Lives Matter" or "Dalit lives Matter" it will soon be forgotten and gone in vain. In this article we will try to understand the evil of "Hate Crimes" in an elaborate form.

Definition of Hate and Hate Crimes

While "hate crime" would be the term most often used in the United States to describe an attack by a white supremacist against an African American, the act would be known in Germany as "right-wing violence" or "xenophobic violence." In Britain and France, it would be referred to simply as "racial violence."[2]

Hate

- intense hostility and aversion usually deriving from fear, anger, or sense of injury
- extreme dislike or disgust:ANTIPATHY, LOATHING had a great *hate* of hard work
- a systematic and especially politically exploited expression of hatred a crime motivated by bigotry and *hate*.[3]

[2] Mark S. Hamm, "Terrorism, Hate Crimes, and Anti-Government Violence: A Preliminary Review of the Research" (background paper for National Research Council, Commission on Behavioral and Social Sciences and Education, Committee on Law and Justice, March 1996), p 11.
[3] Merriam Webster Dictionary

- The Penguin Dictionary of Psychology defines hate as a "deep, enduring, intense emotion expressing animosity, anger and hostility toward a person, group or object."[4]

Hate Crime

Any of various crimes (such as assault or defacement of property) when motivated by hostility to the victim as a member of a group (such as one based on color, creed, gender, or sexual orientation).[5]

Hate crime, harassment, intimidation, or physical violence that is motivated by a bias against characteristics of the victim considered integral to his social identity, such as his race, ethnicity, or religion. Some relatively broad hate-crime laws also include sexual orientation and mental or physical disability among the characteristics that define a hate crime.[6]

A crime, usually violent, motivated by prejudice or intolerance toward an individual's national origin, ethnicity, color, religion, gender, gender identity, sexual orientation, or disability.[7]

In nutshell, what we have is gender-based violence, biased violence, caste- based violence, honour killings, communal riots, violence and differential treatment against people on the basis of colour and race, xenophobia, witch=hunting, violence towards LGBTQ community, ragging and bullying in schools and colleges, and such other instances,againstwhich we do rallies and candle marches.

Many of these crimes are largely and exclusively committed in India.

Nature and Characteristics of Hate Crime

A hate crimeisnot like any other crime. It has some kind of biases attached to it. It is an extreme form of discrimination in which an individual or a group of individuals with common characteristics are targeted.

Schafer and Navarro wrote about the seven stages of hate crimes as a model to understand what an offender may endure before committing violence. These are:

Stage 1: The Haters Gather.

Stage 2: The Hate Group Defines Itself.

Stage 3: The Hate Group Disparages the Target.

Stage 4: The Hate Group Taunts the Target.

Stage 5: The Hate Group Attacks the Target without Weapons.

Stage 6: The Hate Group Attacks the Target with Weapons.

Stage 7: The Hate Group Destroys the Target. [8]

[4]Reber AS, Reber E: The Penguin Dictionary of Psychology. New York, Penguin Books, 2002
[5]ibid
[6]Encyclopaedia Britannica
[7]www.dictionary.com
[8]Schafer JR, Navarro J: The Seven-Stage Hate Model: the psychopathology of hate groups. FBI Law Enforcement Bulletin, March 2003.

Another aspect in terms of psychology is explained by classifying the offenders in terms of their motivations for committing hate crimes. Levin and McDevitt developed a typology that identified three primary motivations for the commission of hate crime. In extension to their study Glen Kercher, Claire Nolasco and Ling Wu added one more class of offenders by studying various scholars.9

- Thrill seeking offenders
- Defensive offenders
- Mission offenders
- Retaliatory offenders

Thrill seeking offenders are looking for excitement—at someone else's expense—by destroying property and harassing minorities, often through brutal physical attacks. Further, they want to exercise their power to gain status and prestige among their peer groups who encourage hatred.

Defensive offenders commit hate crimes to protect or defend their community or way of life that, in their view, is being threatened, simply by the presence of a different group.

Mission offenders are those who are attached to their prejudice and ideology, which becomes a mission to get rid of all members of a particular group of people, believing them to be evil and subhuman.

Retaliatory offenders commit hate crimes in response to a perceived or actual hate crime. This attack could be motivated by a rumour, before even being verified for accuracy.[10]

If we look at these theories and compare them and fit them in the Indian Context, we will come to a conclusion that all the hate crimes are motivated by either one or more of these together. But most prominent are the defensive and mission offenders.

History of Hate Crimes in India

In India, Hate crime is not a recent or an unfamiliar concept. The only difference between India and other countries is that in India we don't use the word "Hate Crime". Our authorities prefer to keep the word "Hate" segregated from the word "Crime". We have different laws pertaining to different crimes but there is no law which uses the word "Hate crime" as a blanket for all the crimes done in lieu of hatred or bias against a community or a caste or a race or a religion or a gender or an individual.

The concept of bias-motivated violence is not new to India. It is evident from the fact that how the framers of the Constitution of India, at its very inception expressly addressed the issue of untouchability and declared all practices of discrimination based on untouchability as unconstitutional.[11]

[9] McDevitt J, Levin J, Bennett S: Hate crime offenders: an expanded typology. Journal of Social Issues 2002; 58:2:303-317, Kercher G, Nalasco C, Wu L: Hate Crimes. Sam Houston State University, 2008.
[10] Ibid.
[11] Article 17, The Constitution of India, 1950.

In the Indian history, there are no cases of hate crimes because as said earlier they were never considered as crimes committed due to bias towards someone. These crimes are punishable under different legislations. To make a particular offence punishable one must recognise it as a crime first.

Hate crimes are very common in India and had been so since very long but are known by diverse names such as mob lynching, mob violence, public outrage, cow vigilantism, witch-hunting, communal violence, rioting and caste violence against Dalit Dalits etc. If we look into the history of these individual crimes we may probably find many cases.

In India Hindu-Muslim conflicts are primordial. As the Hindus constitute majority of the population in India they try to socially, politically and religiously have dominance over the other minorities. The Hindus feel agitated while talking about how the Indian subcontinent was invaded by the Muslim emperors- Turks, Afghans, and Mughals. All these rulers forced Hindus to Convert to Islam and it did result in mass conversions. Then came the Britishers who divided the people of India on the basis of religion. With the Independence came the partition of India and Pakistan which resulted in the division on the basis of community. It was known as the most enormous mass migration in history leading to extreme violence on and from both sides. Since then there have been numerous instances of inter-community clashes.[12]

The religious tension in India became dangerously high when Babri Masjid was demolished on December 6, 1992, in Ayodhya, Uttar Pradesh, by Karsewaks of Vishwa Hindu Parishad and allied organisations. They contended that this masjid was built by Babur after demolishing a temple of Lord Rama, Ayodhya, being Lord Rama's birthplace.

After ten years, on February 27, 2002, Sabarmati Express train carrying the Hindu pilgrims from Ayodhya to Godhra, Gujarat, was set on fire. Around 59, most of whom were Karsewaks, died.

It was followed by the Gujarat Violence, which was the extreme violence since Independence in which almost 2000 individuals were killed, 1,50,000 displaced and over 800 women and girls raped, mutilated and burnt, accompanied with destruction, arson attacks, demolition of around 132 Mosques and religious tombs. Most of the victims in this case were Muslims.[13]

There have been an increase in the number of cases of communal riots, since then and have been rapidly increasing every year. There are other types of Hate crimes as well some of them are discussed here.

Types of Hate Crimes in India

Racism

Racism means when people are discriminated on the basis of their colour and ethnic backgrounds. Racial discrimination exists in India but is not taken that seriously. Mostly, it is the people from North East who facing this problem. Many of the racism cases go unattended and only the cases like that of Nido[14] receive media and public attention. Government must act

[12]Chandra, B., Mukherjee, M., Mukherjee, A., Mahajan, S., &Panikkar, K. N. (2016). India's struggle for independence. Gurgaon, Haryana, India: Penguin Books.

[13] Introduction, Gujarat Ongoing Genocide, Islamic Human Rights Commission, 2002

[14]Nido was studying in Jalandhar and came to Delhi to meet his friends. At Lajpat Nagar, he asked for the address from a local shopkeeper. But the shopkeeper along with other fellow shopkeepers in the vicinity made mockery of Nido's hair style and colour. Out of rage, Nido broke the glass item worth Rs. 7,000. Nido was then beaten up mercilessly with iron rods and sticks by six people. Police intervened to solve the matter and made Nido pay back Rs. 7,000, which he did. He then went to his room at his sister's home, but the next day was found dead in

in a significant way and come up with stringent laws to stop the racial discrimination.[15] National Human rights commission conducted a study that revealed that 54%people from North-East India do not find New Delhi a safe and secure place to live, in terms of ethnic tolerance. Whereas, 67% people from North-East faced ethnic and racial discrimination in New Delhi. The living and working conditions for North-East Indians in New Delhi and elsewhere in North India are horrible and hostile. The Supreme Court of India (SC) took stringent action and issued guidelines to curb racial discrimination in the case of Karma Dorjee & Others v. Union of India & Others (December 14, 2016) whereby petitioner had alleged that people from north-eastern region, who move out of their states in search of better opportunities in studies and jobs, were subjected to racial taunts, hate crimes and violence on a daily basis due to their physical appearance at the hands of people of their own country. How can India brag about Unity in Diversity when people of the same country are discriminated by their own people? Despite what we may say, India is a racist country in this scenario. We give more importance to a fairer skin and there are even advertisements showing that you won't get a job or a suitable match if your skin colour is not fair. Along with the people of North- East India, the people from South India are also judged on the basis of their colour. We tend to forget that Kerala is the number one state in terms of literacy, Human Development Index and per capita income. The number of violence cases against women and female infanticide cases are far less as compared to North India but we still show our supremacy by the colour or ethnicity.

India is also a signatory to *International Convention on the Elimination of All Forms of Racial Discrimination (ICERD)* which calls for States to prevent and combat racist practices in order to build an international community free from racial segregation. Article5[16] of this convention is recurrently violated in India.

[15]https://www.mapsofindia.com/my-india/society/indians-discriminate-indians-case-of-racial-discrimination-and-death.

[16]Article 5

In compliance with the fundamental obligations laid down in article 2 of this Convention, States Parties undertake to prohibit and to eliminate racial discrimination in all its forms and to guarantee the right of everyone, without distinction as to race, colour, or national or ethnic origin, to equality before the law, notably in the enjoyment of the following rights:
(a) The right to equal treatment before the tribunals and all other organs administering justice;
(b) The right to security of person and protection by the State against violence or bodily harm, whether inflicted by government officials or by any individual group or institution;
(c) Political rights, in particular the right to participate in elections-to vote and to stand for election-on the basis of universal and equal suffrage, to take part in the Government as well as in the conduct of public affairs at any level and to have equal access to public service;
(d) Other civil rights, in particular:
(i) The right to freedom of movement and residence within the border of the State;
(ii) The right to leave any country, including one's own, and to return to one's country;
(iii) The right to nationality
(iv) The right to marriage and choice of spouse;
(v) The right to own property alone as well as in association with others;
(vi) The right to inherit;
(vii) The right to freedom of thought, conscience and religion;
(viii) The right to freedom of opinion and expression;
(ix) The right to freedom of peaceful assembly and association;
(e) Economic, social and cultural rights, in particular:
(i) The rights to work, to free choice of employment, to just and favourable conditions of work, to protection against unemployment, to equal pay for equal work, to just and favourable remuneration;
(ii) The right to form and join trade unions;
(iii) The right to housing;
(iv) The right to public health, medical care, social security and social services;
(v) The right to education and training;
(vi) The right to equal participation in cultural activities;

Hate Speech

The term Hate speech means "a speech that carries no meaning other than an expression of hatred for some group, such as a particular race, especially in circumstances in which the communication is likely to provoke violence."[17]

In a country like India with such a diverse culture, religion, races, languages, caste, it is very difficult to draw a line between freedom of speech and expression and hate speech. Freedom of expression certainly allows a personto give theiropinion, but if that opinion is an attack, theycan instead be a decent person and chose not to give it. Freedom of expression is not equal to being racist, homophobic, sexiest, misogynistic etc. Hate crime and consequently hate speech attacks the victim not only physically but also at the very core of his or her Identity.

Although the term hate speech is nowhere mentioned in any statute the laws pertaining to it are identified in legislations.

Apart from the Constitution of India, there are legislations that neutralize the hate speech in India such as The Indian Penal Code under section 153A[18], 153B[19], 295A[20], 298[21], 501(1)[22], 501(2)[23] declares that the words spoken or written that promotes dissonance, hatred or looks down upon any religion, culture, language, region, caste, race, community, ethnicity etc is punishable by law.

On similar analogy, the Representation of People Act, 1951[24], The Protection of Civil Rights Act, 1955[25], Unlawful Activities (Prevention) Act, 1967[26], The Code of Criminal Procedure, 1973[27], contain provisions for hate speech. However the word Hate speech is nowhere used in these Acts.

There are few instances of Hate speech worth mentioning here. Union Minister Mr. Anurag Thakur and BJP MP Mr. Parvesh Verma received a ban of 72 hours and 96 hours, respectively from campaigning for the Delhi Elections. The reason behind the same was the 'Hate Speech' that they delivered in their respective rallies in Delhi. While Mr. Thakur urged the crowd in a rally to shout "*Goli Maaro* (gun down the traitors)", Mr. Verma claimed in a rally that those who are protesting at Shaheen Bagh against the new Citizenship Law will one day enter the houses and rape our sisters and daughters.[28]

(f) The right of access to any place or service intended for use by the general public, such as transport hotels, restaurants, cafes, theatres and parks.

Lynching

Lynching, a form of violence in which a mob, under the pretext of administering justice without trial, executes a presumed offender, often after inflicting torture and corporal mutilation. The term *lynch law* refers to a self-constituted court that imposes sentence on a person without due process of law. [29]

In ***Tehseen S. Poonawala vs. Union of India[30],*** the supreme court of India has defined Lynching as targeted violence which affects the human body and is against private and public property.

Lynching is again a performative act of hate violence. It has become a concern because these acts of mob-lynching are now video graphed and circulated widely through social media and are kind of celebrated as if they are the acts of national heroism. Lynching can be understood in simple terms as an act where a mob kills any person without hearing his part of arguments; the anger of the mob may be due to a rumour, but taking law in their own hands, they carry on with the execution in public.

Even though the Supreme Court highlighted the need for a concrete definition of 'lynching' as a form of vigilantism in July 2018 and directed the state governments to put in place certain preventive, remedial, and punitive measures to combat mob violence, only Rajasthan and Manipur have passed designated legislation. On the other hand, the central government maintains that state governments are competent to enact legislation criminalizing mob lynching. In the absence of any specific laws, these incidents are booked under various legal provisions such as 'rioting', 'unlawful assembly', 'murder', 'criminal intimidation', 'intentional insult with intent to provoke breach of peace' etc., which dilutes the gravity of the offence and renders the statistics inadequate as well as misleading.[31]

Witch Hunting

Even in today's scientific era people still believe in witchcraft and black magic. Calling today's society as progressive when people are still being branded and killed for witchcraft is just hypocrisy.

Witch hunt means "an attempt to find and punish people whose opinions are unpopular and who are said to be a danger to society."[32]

Definition of Witch Hunt

- A searching out for persecution of persons accused of witchcraft
- The searching out and deliberate harassment of those (such as political opponents) with unpopular views.[33]

There have been many instances covered by the media. In 2014, national athlete Debjani Bora, who had won several gold medals in Javelin, was accused of witchcraft in Assam and brutally assaulted by the villagers. As I'm writing this article an elderly couple was burnt to death in their sleep on suspicion of practicing witchcraft while a witch doctor allegedly branded a woman's face with hot iron and forced her to eat pig's excreta to cure her of an ailment in Odisha. In

[29]Encyclopaedia Britannica.
[30](2018) 6 SC 72.
[31]https://amnesty.org.in/news-update/hate-crime-reports-on-an-alarming-rise-reveals-amnesty-international-indias-halt-the-hate/
[32]Cambridge Dictionary(dictionary.cambridge.org/)
[33]The Merriam-Webster Dictionary(https://www.merriam-webster.com/dictionary/witch%20hunt)

Nimapali village of Jajpur district, miscreants set fire to the house of an elderly couple - Shaila and Basanti – Balu late at night when they were sleeping in their home. Villagers suspected the couple of practicing witchcraft after about half a dozen people of Nimapali died due to different causes over the last two weeks. The couple was killed in the blaze.[34]

This evil practice of witch hunting can be resorted if only effective measures and promulgation of laws are done in an efficient manner. There are legislations enacted by some States where this menace is widely practiced. These are as under:

- Prevention of Witch (Dayan) Practices Act, 1999–Bihar;
- Rajasthan Government enacted the Rajasthan Prevention of Witch-hunting Act, 2015;
- Odisha government enacted the Odisha Prevention of Witch-hunting Act, 2013 which became enforceable in February 2014;
- Chhattisgarh government enacted the Chhattisgarh Tonahi Pratadna Nivaran Act, 2005;

These acts have been passed by the respective state legislatures. There is, however, no central law to restrict the practice or its modern forms at the national level.

It is also important to note that modern witch hunting is a result of age-old beliefs or deep-rooted stereotypical notions against females and bias against women. This is definitely one of the crimes which must be put under the definition of Hate Crime.

Cow Vigilantism

The word vigilante has originated from the word vigilant which means to lookout for possible difficulties and danger.The word Vigilante means a person who tries in an unofficial way to preventcrime, or to catch and punish someone who has committed a crime, especially because they do not think that official organizations, such as the police, are controlling crime effectively. Vigilantes usually join together to formgroups.[35]

A member of a volunteer committee organized to suppress and punish crime summarily (as when the processes of law are viewed as inadequate) *broadly*:a self-appointed doer of justice.[36]

Cow vigilantism has sadly become a veil for violence, murders and brutality in the name of cow protection. These cow vigilantes are killing men and women to save the cows. There is no denying the fact that the cow is considered a sacred animal in India but does that mean that one human can kill another human being in the name of its protection. It is high time that our leaders must speak out and speak up in favour of those being slaughtered horrifically in the name of cow protection. The legislators must come up with laws on considering this as a hate crime.

Misogyny/ Gender –Based Violence

Misogyny means "feelings of hating women, or the belief that men are much better than women"[37] India being a patriarchal society, would never think of misogyny as a hate crime because it is the birth right of a male to insult his wife,

[34] Hindustan Times, 20th July, 2020.
[35]https://dictionary.cambridge.org/dictionary/english/vigilante.
[36]https://www.merriam-webster.com/dictionary/vigilante.

mother, daughter or a colleague becauseshe is a female. We can very well understand the plight of a female in India as marital rape is not considered as a crime as the law does not consider sexual intercourse by a man withhis own wife unless she is below 15 years as a rape even if he does it without her consent.

For years we have been conditioned by our society that womenare inferior to men as is being shown in our films these days where the male lead is always glorified. We have made it a part of our upbringing that it's okay to laugh atthe jokes about the wife being dumb, or it's alright if the father comes home drunk and beats his wife. We do not raise our voice if a woman is being disrespected at her workplace because we think it to be normal. Different types of gender-based violence include rape, domestic violence, sexual harassment, virginity test, all forms of physical, emotional, sexual, economic abuses to which women, and not men, are victims.

This treatment needs to be stopped and men can help women achieve their rightful place by acknowledging her worth at home and at work by telling her that her consent matters not only sexually but in everyday life.

Caste Based Violence

This is the oldest form of violence that has existed in India and has still not diminished. India banned caste-based discrimination in 1955. Article 15 of the Constitution of India prohibits discrimination based on caste, and Article 17 declared the practice of untouchability to be illegal. But, this law doesn't deter those who adamantly continue to follow the system. The Human Rights Watch (HRW) notes that India's caste system is perhaps the world's longest surviving social hierarchy.

Recently 13 youngsters brutally assaulted a 32 years old Dalit for allegedly touching the bike of an upper caste. The Dalit was stripped naked and thrashed publically. His family members were also beaten with him when they attempted to save him from the mob.[38]

Three Dalit boys in Jalgaon district's Vakadi village were allegedly stripped, beaten and paraded naked for swimming in a village well. The incident, which took place on June 10, 2020, came to light after a video of it went viral. Maharashtra Minister for Social Justice Dilip Kamble said, "Two persons have already been arrested. An investigation is under way."[39]

On 17 June, 2018, Prashant Solanki, a Dalit man in his late 20s, was on his way to his wedding riding a colourfully decorated horse, as is common practice, when he was ambushed by a group of upper-caste villagers. They insisted that riding a horse was an upper-caste privilege and threatened to attack Mr. Solanki and his family.[40]

These are just few instances of caste- based violence. Every now and then Dalits are being ill- treated, assaulted, and killed, for many trivial matters. It is of grave concern as to when these attacks will be acknowledged as hate crime.

Xenophobia

Xenophobia means "fear and hatred of strangers or foreigners or of anything that is strange or foreign."[41]

---

[37]https://dictionary.cambridge.org/us/dictionary/english/misogyny
[38]https://gulfnews.com/world/asia/india/india-dalit-man-allegedly-stripped-and-assaulted-by-13-for-touching-an-upper-caste-mans-bike-1.1595343062332
[39]The Indian Express
[40]BBC News, 19th June, 2018.

"Extreme dislike or fear of foreigners, their customs, their religion, etc."[42]

Xenophobia and Racism are similar yet different terms altogether.

As we all know that we were invaded by the French, Portuguese, Britishers, and Turks etc. from time to time. It is natural to hate or have a fear of foreign invaders but as we have come so far after Independence fear has now cropped up into hatred towards immigrants, sometimes turning hostile towards them. This hatred or fear is there because being a citizen of a country we do not think it proper to dilute our culture or ethnicity by these immigrants or foreigners. Here is when it becomes dangerous when we want to eliminate these outsiders from our country.

There have been number of instances where African and Nigerian students were beaten up in Delhi and Bangaluru. They were accused of cannibalism and selling drugs, mostly. We have read about the agitation that took place because of immigration of Rohingiyas. We believe in the motto of "Atithi Devo Bhava" but we will only allow Bengali-Hindus to immigrate and not Bengali-Muslims.

All cases of Xenophobia are not reported, and if reported we do not have any law which says that xenophobia is a crime so how are we going to punish the perpetrator?

Honour Killings

Honor killing, most often, the murder of a woman or girl by male family members. The killers justify their actions by claiming that the victim has brought dishonor upon the family name or prestige.[43]

In India, the government enacted strict penalties for violence against women during the 1980s. However, honor killings based on inter-caste and inter-religious marriages continued to take place in rural areas, where they were largely unreported to police because of direct or indirect support among village residents. Such murders were often ruled as accidents when reported. A woman beaten, burned, strangled, shot, or stabbed to death could be ruled a suicide, even if there were multiple wounds and there was no possibility the woman could have killed herself.

Honour killing (also known as Shame Killing) results, mostly in the death of a woman as she is supposed to keep the honour of a family. We have read about the famous case of Manoj- Babli where a newlywed couple was killed in 2007. The cases of honour killing are prevalent more in northern regions of India particularly Haryana, Punjab, Rajasthan and Uttar Pradesh.

Honour killings are a severe disregard to the human life and a clear violation of Universal Declaration of Human Rights and the fundamental rights enshrined in the Constitution of India.[44]

Now looking at the various crimes which can be covered under the hate crimes there is a dire need of enacting a comprehensive hate crime law.

[41]https://www.merriam-webster.com/dictionary/xenophobia
[42]https://dictionary.cambridge.org/dictionary/english/xenophobia
[43]https://www.britannica.com/topic/honor-killing
[44]See Article 21, Right to life and personal liberty.

Need for a Legislation

Studies of hate crimes show a steep rise in numbers over the past decade. Amnesty International India's website "Halt the Hate" records the number of hate crimes committed in India as our own National Crime Record Bureau fails to keep an update of the data since 2016. From September, 2015 to June, 2019, Halt the Hate has recorded a total of 902 reported hate crimes in India. A total of 181 incidents of alleged hate crimes were recorded between the months of January and June this year. In 37 reported incidents, the victims were killed. Between January and June 2019, over two-third of the victims suffered harm on account of their Dalit identity followed by their Muslim (40), Adivasi (12), Christian (4) and their actual or perceived sexual orientation or gender identity (6). Some of the alleged hate crimes against Dalits related to denial of access to public property such as roads, water, crematorium, schools etc. Cow-vigilantism related hate crimes and honour killing were reported in 17 cases.[45]

In 2018, Supreme Court directed Central and State Governments to make it widely known that lynching and mob violence would "invite serious consequences under the law".[46]There were only few States who came up with specific legislations to fight lynching and Mob violence.

The Rajasthan Assembly passed two bills in which death penalty have been proposed for hate crimes against couples in the name of honour and tradition and life imprisonment for mob lynching. The Rajasthan Prohibition of Interference with the freedom of Matrimonial Alliances in the name of Honour and Tradition Bill, 2019 and the Rajasthan Protection from Lynching Bill, 2019 were tabled in the assembly by law minister.[47]

The Uttar Pradesh Law Commission took the initiative to recommend a draft of anti-lynching law. It follows the first ever law against lynching passed in the country, introduced by the Manipur Government which is the most significant statute against religious hate crimes in India. Both the Manipur statute and UPLC draft create a new crime which includes dereliction of duty by police officers. It holds the police officer guilty if he or she failed to prevent lynching without reasonable cause and omits to exercise authority given to them under law. It attracts penalty for one to three years and a fine.

The UPLC also makes provision for compensation to the victim of violence within 30 days of the incident.[48]

These are the legislations which were enacted by the particular State but we need legislation enacted by the Central Government which shall be applicable throughout India. Right now we have scattered laws and legislations against hate crimes because we have not put them together under one head. We must learn from the U.S. It took the United Nations Senate 100 years to approve a bill to make lynching a federal crime. Over 200 anti lynching bills were introduced since 1918, but all were rejected until the Justice for Victims of Lynching Act, 2018.

Unfortunately, hate crimes in India are unknown because the law does not recognise it as a separate offence and in the absence of any specific laws these cases are booked under scattered legislations and provisions. All the political leaders have spoken against hate crimes and expressed pain over such incidents but their words are not backed by action. It is high

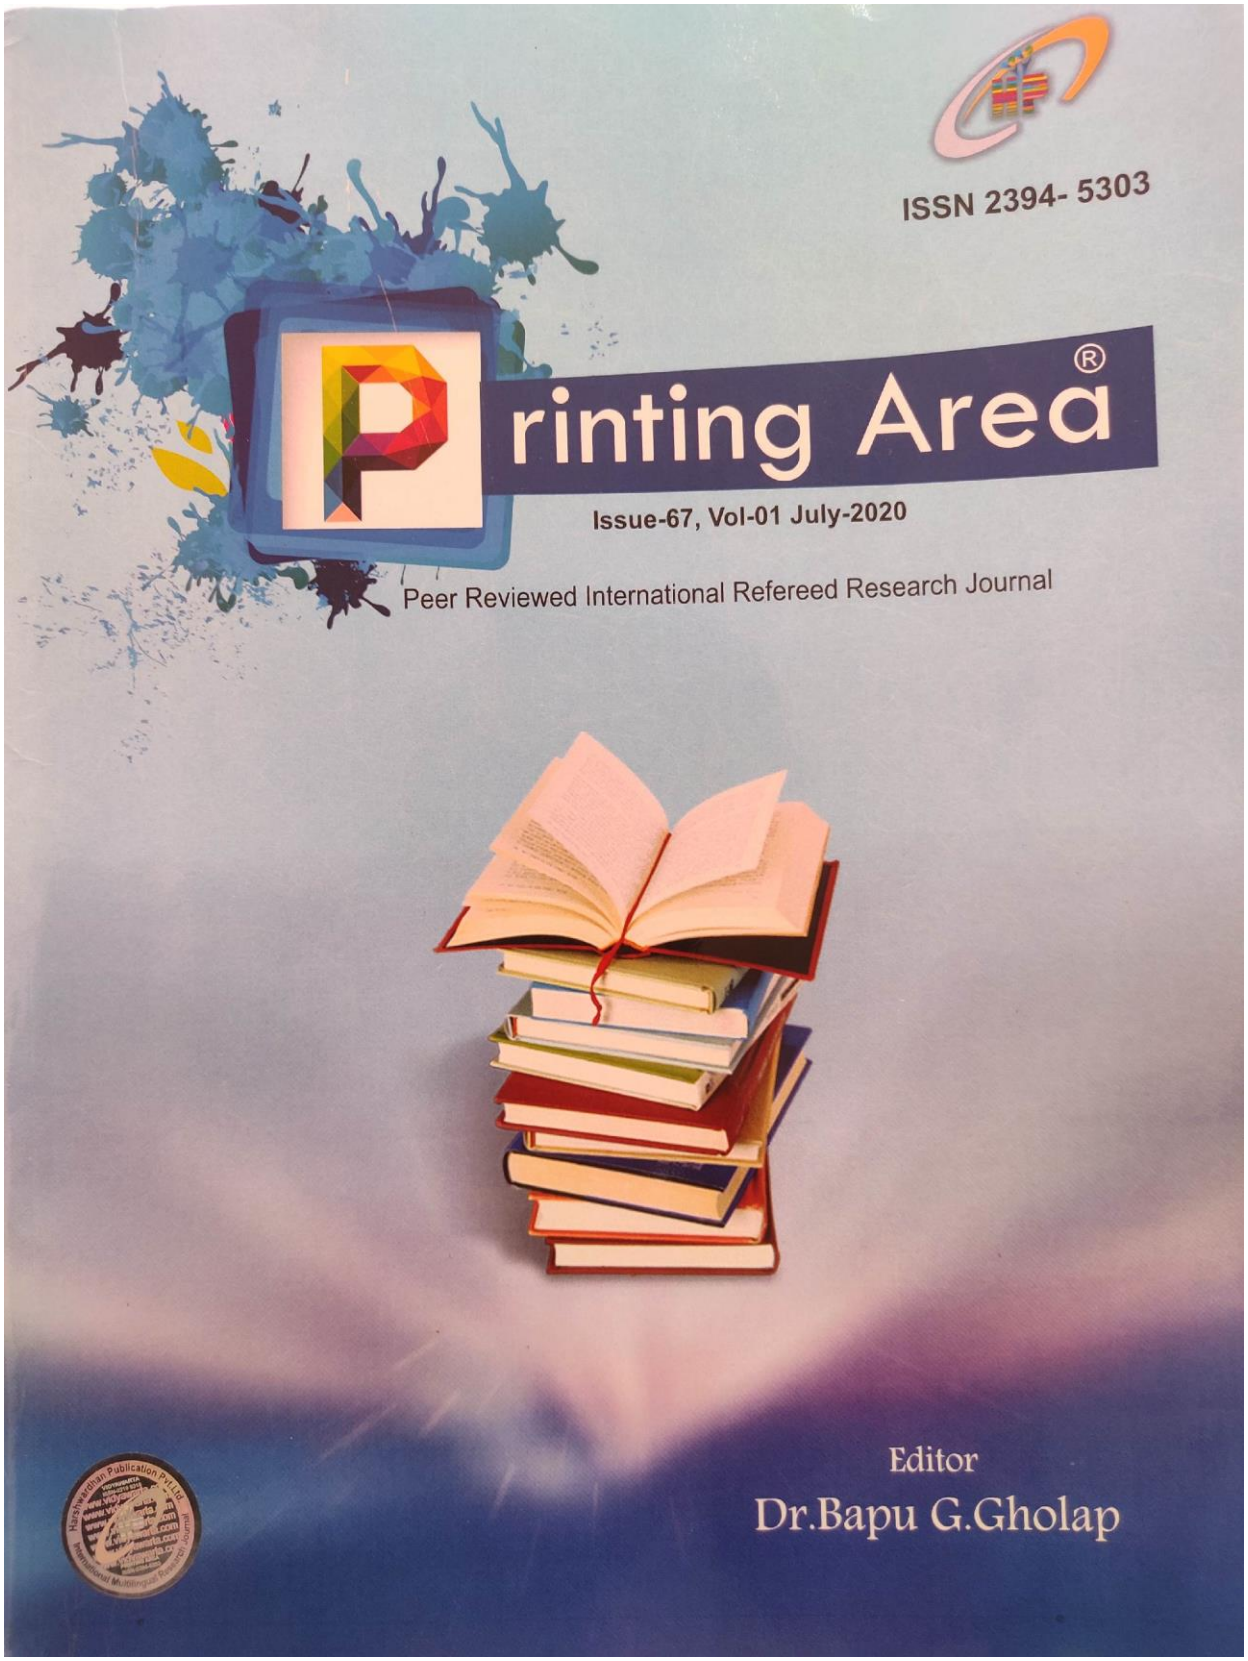
time that India acknowledges and punishes hate crimes. We cannot let it pass just as routine incidents. We as citizens also need to wake up and question our laws and its inadequacies.

CONCLUSIONS

We wonder sometimes as to how long the survivors of hate crimes who lost their near and dear ones in India have to wait for a government who will finally recognise their pain. Considering the present state of turmoil in Society, the hate crimes are on a rise. In a heterogeneous culture like India it would be next to impossible to live peacefully with one another. There is definitely a necessity for a separate legislation for Hate crimes and it needs to be strictly implemented. First step that can be taken by the authorities is to ensure that the legislation should be broad enough to include lynching, caste based violence, gender based violence, xenophobia, honour killing, racism, cow vigilantism, witch hunting and hate speech under the purview of Hate Crimes. The hate crimes should be distinguished from ordinary crimes. The collection of data for hate crimes should be done periodically. The trials for the hate crimes must be done in fast track courts so that the victims or their survivors do not suffer a secondary attack. As is proposed by the UPLC, compensation should be provided to the victims and their families.



There is a necessity of a comprehensive legislation in India. It is pertinent to mention that the Parliament must wake up as soon as possible and come up with laws on Hate crimes and set up a benchmark for policemen and administrators to deal with hate crime. It is the duty of the politicians, electronic and print media, and the teachers in schools, colleges and universities to inculcate the virtue of tolerance in people and be responsible citizens of India.

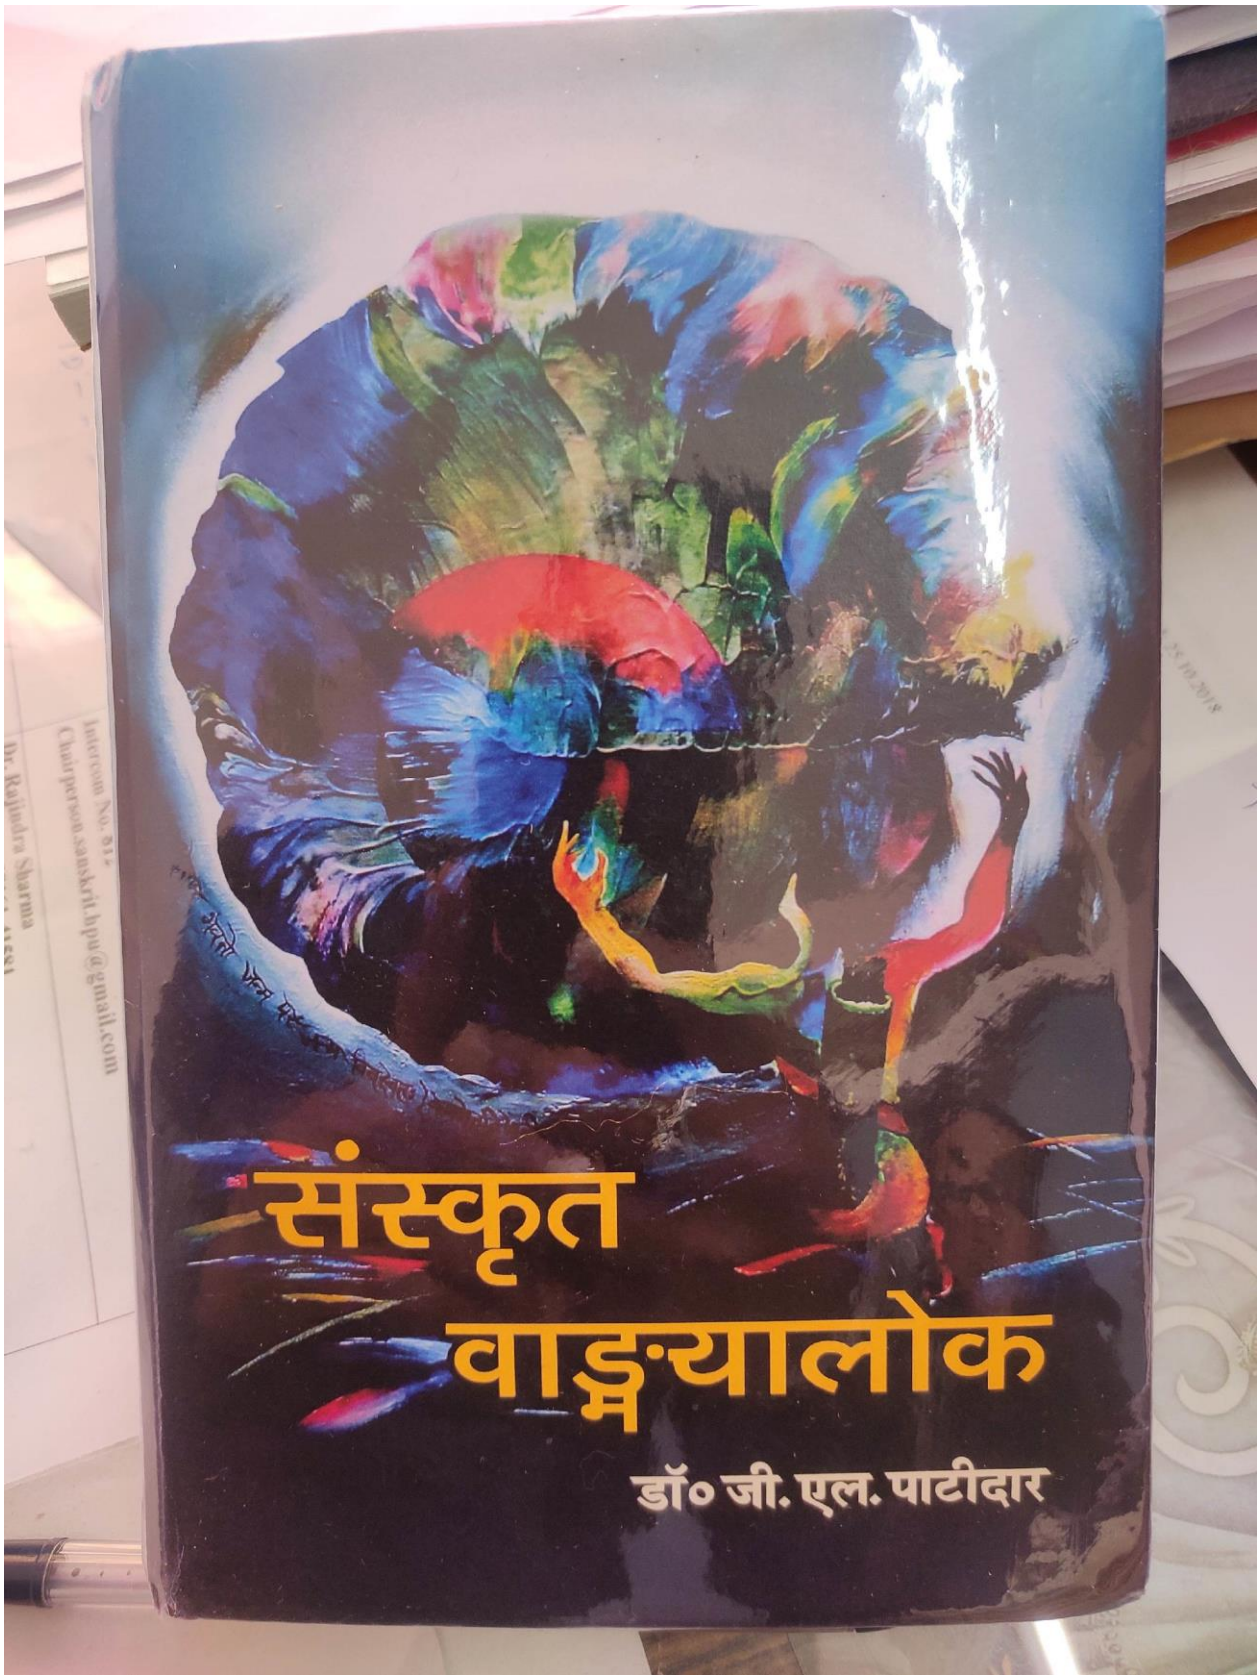
संस्कृत साहित्य में नारी

डॉ. लता देवी
सहायक आचार्य, संस्कृत-विभाग,
हिमाचल प्रदेश विश्वविद्यालय शिमला

==========**********==========



संक्षेपिका

संसार में समस्त प्राणियों में मनुष्य की श्रेष्ठता सर्वोपरि है। वह बुद्धिबल के कारण ही तो अन्य प्राणियों से महान् है। इस मनुष्य जाति के दो रूप है – नर और नारी। वेद में नारी को समाज में मूर्धन्य, सबको धारण करने वाली और तेजस्विनी कहा गया है। किन्हीं लोगों ने स्त्री के लिए 'अबला' शब्द का प्रयोग किया है। परन्तु वेदों में इस प्रकार का कोई शब्द सुनाई नहीं देता। इसके विपरीत वहाँ वीरिणी–वीर पुत्रों को जन्म देने वाली अथवा वीरता के कार्य करने वाली, इत्यादि रूप में नारियों का वर्णन मिलता है।

सर्वप्रथम वैदिक वाङ्मय में नारी, राजनीतिक सन्धिविग्रह, नारी के महत्त्व के विभिन्न स्वरूप, नारी शिक्षा तथा अन्त में निष्कर्ष के ऊपर प्रकाश डाला गया है।

सृष्टि के प्रारम्भ में परमात्मा ने अपने को दो रूपों में विभक्त किया, आधे से वे पुरुष एवं आधे से नारी हो गए। धर्मप्राण भारत में वेद, पुराण, स्मृति आदि ग्रन्थों ने स्त्रियों को पुरुषों की अर्द्धांगिनी माना है। धर्म कार्यों में पत्नी रहित पति का निषेध किया गया है। मानव का नारी के साथ शारीरिक, रागात्मक और धार्मिक सम्बन्ध होने के कारण भी नारी के स्वरूप–भेद हुए और उनके सूचक शब्दों की अलग–अलग सृष्टि हुई। जिस तरह एक छोटे से ओस–बिन्दु में सम्पूर्ण सूर्य–मण्डल प्रतिबिम्बित हो जाता है, उसी तरह नारी–वाचक छोटे से छोटे शब्द में भी उसकी जाति, गुण, क्रिया अथवा इच्छा झलक जाती है।[1]

नारियों की चर्चा के बिना किसी साहित्य की कल्पना नहीं की जा सकती। संस्कृत साहित्य उस परंपरा में विशिष्ट है। वह संस्कृत वाङ्मय ही है जिसमें सीता

वाल्मीकि रामायण कालीन भारतीय समाज

—डॉ० लता देवी
सहायक आचार्य, संस्कृत-विभाग
हिमाचल प्रदेश विश्वविद्यालय
शिमला

संक्षेपिका

राम कथा सम्बन्धी साहित्य की रचना सर्वप्रथम इक्ष्वाकु वंश के सूतों द्वारा आख्यान काव्य के रूप में हुई थी जिन्हें आधार बनाकर वाल्मीकि ने रामायण नामक प्रबन्ध-काव्य की रचना की। इस आदिकाव्य में अयोध्याकांड से लेकर युद्ध कांड तक की कथावस्तु का वर्णन था। इस काव्य में राम को एक आदर्श मानव के रूप में चित्रित किया गया है।

सर्वप्रथम आश्रम व्यवस्था के चारों आश्रमों का उल्लेख किया गया है उसके बाद पारिवारिक-सम्बन्ध, विवाह, खान-पान, वेश-भूषा, आमोद-प्रमोद तथा अन्त में निष्कर्ष को बताया गया है।

व्यवस्था समाज के सदस्य के रूप में व्यक्ति को उसके अधिकारों एवं कर्त्तव्यों का ज्ञान कराती है, आश्रम व्यवस्था व्यक्ति को ऐसा रूप प्रदान करती है, जिससे वह स्वयं को जीवन की विभिन्न अवस्थाओं को तैयार करते हुए, पुरुषार्थ-चतुष्टय की सिद्धि में सफल होता है।

आश्रम व्यवस्था

आश्रम शब्द श्रम् से बना है। जिसका अर्थ उद्योग अथवा प्रयत्न। 'आश्रम्यन्ति अस्मिन् इति आश्रमः' अर्थात् जीवन का ऐसा क्रम, जिसमें मनुष्य पुरुषार्थ चतुष्टय

आधुनिक शिक्षा-शास्त्र पर वैदिक शिक्षण विधा का प्रभाव

—डॉ० दीप लता
सहायक आचार्य, संस्कृत विभाग
हिमाचल प्रदेश विश्वविद्यालय,
शिमला (हि०प्र०)

मानव व्यवहार में शिक्षणाभ्यास की प्रक्रिया का अभूतपूर्व योगदान है, जिसके कारण अनादिकाल से लेकर अद्यतन के विभिन्न दार्शनिकों ने सामाजिक आवश्यकतानुसार शिक्षा-तत्त्वों के विवेचन द्वारा मानव-जीवन में उसकी उपयोगिता पर प्रकाश डाला है। शिक्षा ही जीवन है और जीवन ही शिक्षा है। दोनों के इस अभेद्य सम्बन्ध को नकारा न जाने के कारण ही सा विद्या या विमुक्तये अथवा सा विद्या या ब्रह्मगतिप्रदा के द्वारा विद्या के महत्त्व को पूर्वाचार्यों ने विवेचित किया है, जिसका बोध हमें ज्ञान की उस विधा द्वारा होता है, जिसमें व्यक्ति के वैयक्तिक गुणों की अभिवृद्धि के साथ-साथ उसके सामाजिक, सांस्कृतिक और राष्ट्रीय कर्तव्यों को निश्चित करना रहा है। आधुनिक शिक्षा-शास्त्र पर वैदिक शिक्षण-विधा का प्रभाव है। अथवा आधुनिक शिक्षा-शास्त्र वैदिक शिक्षण परम्परा से अनुप्राणित है या नहीं?

इसके उत्तर में अनेकानेक दृष्टान्तों का अवलोकन करना होगा, तब कहीं जाकर इस निष्कर्ष पर पहुँचा जा सकता है कि आधुनिक शिक्षा-शास्त्र वैदिक शिक्षण परम्परा से अनुप्राणित है। **इष्टप्राप्त्यनिष्टपरिहारयोरलौकिकमुपायं यो ग्रन्थो वेदयति स वेदः**। इस उक्ति द्वारा सायणाचार्य ने इष्ट की प्राप्ति और अनिष्ट

यास्ककृत् निरुक्तानुसारं देवता तत्त्व

डॉ0 दीप लता

प्रस्तावना

यास्कप्रणीतस्य निरुक्तस्य सप्तमोऽध्याय दैवतकाण्डनाम्ना ज्ञायते। अस्य दैवतकाण्डस्य द्वितीये पादे आचार्य यास्कः कथयति यत्– ''तिस्रः एव देवताःइति नैरुक्ताः।''[1] अर्थात् निरुक्तानुसारं तिस्रः एव देवता सन्ति।

तिस्रः देवताः इमाः सन्ति– अग्नि, वायु एवं सविता सूर्यो वा एतासां सर्वासाम् देवतानां पृथक् पृथग् ग्रहणं कथं कृतम्? इति जिज्ञासायां निरुक्तकारेण प्रोक्तं यत् ''अग्निः पृथिवीस्थानः वायुर्वेन्द्रो वा अन्तरिक्षस्थानः, सूर्यो द्युस्थानः।'' यतो हि लोका अपि त्रयः सन्ति। पृथिवीलोकः, अन्तरिक्षलोकः, द्युलोकश्च।[2] यद्यपि पौराणिक मान्यतानुसारं एतत् जगत् चतुर्दशभुवनमण्डलात्मकं किन्तु वैदिकमान्यातानुसारं अत्रैव सर्वेषां लोकानां ग्रहणं भवति। अतएव एतेषां सर्वेषां लोकानां नियन्त्रणकर्तारोऽपि देवाः इमे एव त्रयः सन्ति।

एतासां देवतानां महाभाग्यात् एकात्मा बहुधास्तूयते। निरुक्तकारेण उक्तं यथा– ''तासां महाभाग्यात् एकैकस्याः अपि बहूनि नामधेयानि भवन्ति''[3] तासां तिसृणामग्न्यादीनामहाभाग्यात् अर्थात् ऐश्वर्ययोगात्, एकात्मनामनेकधा विकुर्वन्तीनामेकैकस्याः प्रतिविकारं जातवेदाः, वैश्वानरः, वरुणः, रुद्रः, अश्विनौ, उषा इत्येवम् आदीनि, बहूनि नामधेयानि भवन्ति।

तिसृषु देवतासु अग्निदेवस्य प्रथमं स्थानं वर्तते। अग्निदेवस्य अयं लोकः अर्थात् भूलोकः पृथिवीलोक वा। प्रातः सवनम् अग्निदेवस्य कृते भवति। बसन्त ऋतुः, गायत्रीछन्दः, त्रिवृत् स्तोमः स्थन्तरं साम अग्निदेवस्य वर्तते। अग्निदेवता प्रथमेस्थाने पठित देवगणस्य प्रतिनिधि वर्तते। अग्नायी इळा पृथिवीमपि अग्न्यान्तर्गतमेव ज्ञातव्यम्। शरद्ऋतुः, अनुष्टुप्छनदः एकविंशतिस्तोमः तथा वैराजसाम अपि पृथिवीस्थानीय वर्तन्ते।[4]

अग्निदेवस्य प्रमुखं कर्म हविषां वहनं देवतानां आह्वाहनं वर्तते। अर्थात् यच्च किंचिद् दार्ष्टिविषयकम्, अग्निकर्म एव तत्। अग्निः अग्रणीः भवति, अग्रं यज्ञेषु प्रणीयते, अंग नयति संनममानः। यज्ञे सर्वप्रथम अग्नेः आह्वानं भवति। यः कोऽपि अग्नेः आश्रयं नयति तं सः आत्मा धीनं करोति। अक्नोपनः भवति–इति स्थौलाष्ठीविः। न क्नोपयति न स्नेहयति। त्रिभ्य आख्यातेभ्यः जायते इति शाकपूणिः। इतात् अक्तात् दग्धात् वा, नीतात्। स खलु एते अकारम् आदत्ते, गकारम् अनक्तेः वा दहतेः वा नी परः।[5] अतः स अग्नि उच्यते। ऋग्वेदे अग्निविषयको मन्त्रो आयाति–

अग्निमीळे पुरोहितं यज्ञस्य देवमृत्विजम्।
होतारं रत्नधातमम्।।[6]

अर्थात्– यज्ञस्य क्रियमाण देवताद्याराधनकर्मणः पुरोहितम् पुरोहितत्वाद भीष्ट संपादकम्। यद्वा यज्ञस्यपूर्वभागे आहवनीयरूपेण संस्थितम्। अग्निर्वै देवानां होता इति श्रुतेः। देवं दानादिगुणयुक्तम्।। होतारम् होतृनामकमाह्वातारं वा देवानाम्। ऋत्विजम् देवानामृत्विग्भूतम्। रत्नधातमम् यागफलरूपाणां रत्नानां अतिशयेन धारयितारं पोषयितारं वा। अग्निम् तन्नामकं देवम्। ळे स्तौमि। यद्वा यज्ञस्येति पदं ''देव'' मित्यनेनान्वेति। यज्ञस्यप्रकाशकमित्यर्थः।।

वायुः वा इन्द्र अन्तरिक्षस्थानीय देवता वर्तते। तस्याः देवतायाः अन्तरिक्षलोकः वर्तते। माध्यन्दिनं सवनम्, ग्रीष्मऋतुः, त्रिष्टुप्छन्दः, पंचदशस्तोमः, वृहत्साम आदि इन्द्रदेवस्य कृते वर्तते। तथा च ये च देवगणाः समाम्नाताः, मध्यमे स्थाने याश्च स्त्रियः। अथास्य कर्म– रसानुप्रदानं, वृत्रवध, या च का च बलकृतिः इन्द्रकर्म एव तत्। अथ अस्य संस्तविकाः देवाः– अग्नि, सोमः, वरुणः, पूषा, बृहस्पतिः, ब्राह्मणस्पति, पर्वतः, कुत्सः विष्णुः, वायुः।[7] ऋग्वेदे अन्तरिक्षस्थानीय देवस्य कृते अर्थात् इन्द्रस्य वायोः वा विद्युतः कृते मन्त्रः वर्तते यथा–

अभिप्रवन्त समनेव योषाः कल्याण्यः स्मयमानासो अग्निम्।
घृतस्य धाराः समिधो नसन्त ता जषाणो हर्य्यति जातवेदाः।।[8]

गृत्समदो ब्रूते। जनासः जनाः हे असुराः। यो जात एव जायमान एव सन् प्रथमः देवानां प्रधानभूतः मनस्वान् मनस्विनामग्रगण्यः। देवः द्योतमानः सन् क्रतुना वृत्रवधादिलक्षणेन स्वकीयेन कर्मणा देवान् सर्वान यागदेवान पर्यभूषत् रक्षकत्वेन पर्यग्रहीत्। यो जात एव प्रथमो मनस्वी देवो देवान्क्रतुना कर्मणा पर्यभवत्पर्यगृहणात्पर्त्यरक्षदत्यक्रामदिति वा। यस्य बलात् द्यावापृथिव्यावप्यविभीतां नृम्णस्य महना बलस्य महत्त्वेन स जनास इन्द्र। यथा–

यो जात एव प्रथमो मनस्वान, देवो देवान्क्रतुना पर्यभूषत्।
यस्य शुष्माद्रोदसी अभ्यसेतां, नृम्णस्य महना स जनास इन्द्रः।।[9]
हेमन्तऋतुः, पंक्तिछन्दः, त्रिणवःस्तोमः, शाक्वरं साम आदि अन्तरिक्षरथानीयाः वर्तन्ते।[10]

अथ उत अभिधानैः संयुज्य हविश्चोदयति इन्द्राय वृऋने। इन्द्राय वृत्रघ्ने, इन्द्रायांहोमुचे[11] अथ उत कर्मभिः ऋषिः देवताः स्तौति – वृत्रहा; पुरन्दरः इति तानि अपि एके साममनन्ति, भूयांसि तु समाम्नानात्। व्यंजनमात्रं तु तत् तस्याभि धानस्य भवति। यथा ब्राह्मणाय बुभुक्षिताय ओदनं देहि, स्नाताय अनुलेपनं, पिपासते पानीयम् इति।।[12]
निरुक्तानुसारं सूर्यदेवता द्युस्थानीयो देवता। आचार्ययास्कः कथयति यत् आदित्यदेवस्य असौ लोकः अर्थात् द्युलोकः तृतीयसवनम्, वर्षाऋतुः, जगतीछन्दः, सप्तदशस्तोम एवं वैरूपंसाम तथा च शिशिरऋतुः, अतिछन्दः त्रयस्त्रिंशत्स्तोम एवं रैवतसामादिद्युलोकभागिनः सन्ति।[13]
आदित्यदेवस्य कर्म रसादानम् अर्थात् रसस्य आकर्षणम्, रश्मिभिश्च रसधारणम् अर्थात् किरणैः रसधारणम् ग्रहणम् तथा च यंच किंचत् प्रवहिलतम् अर्थात् वनस्पत्यौषधीनां वृद्धिः एवं पुष्टिः तत् सर्वम् आदित्यकर्म वर्तते। आदित्यस्य मन्त्र ऋग्वेदे प्राप्यते। यथा–

वैश्वानरस्य सुमतौ स्याम राजा हि कं भुवनानमभ्श्रीः।
इतो जातोविष्वमिदं वि चष्टे वैश्वानरो यतते सूर्येण।[14]

इतो जातः सर्वमिदमिभिविपश्यति। वैश्वानरः संयतते सूर्येण। राजा यः सर्वेषां भूतानामभिश्रयणीयः तस्य वयं वैश्वानरस्य कल्याण्यां मतौ स्यामिति।।
ऋग्वेदे अनुसारं देवानाम् अनीकम् चित्रम् मित्रस्य वरुणस्य अग्नेः चक्षुः सूर्यः उदगात्। द्यावापृथिवी अन्तरिक्षम् आ अप्रा। जगतः तस्थुषः च आत्मा। यथा–

चित्रं देवानामुदगदनीकं चक्षुर्मित्रस्य वरुणस्याग्नेः।
आप्रा द्यावापृथिवी अन्तरिक्षं सूर्य आत्मा जगतस्तस्थुषश्च।।[15]

अथ आदित्यात् उदीचि प्रथम समावृते आदित्ये कंसं वा मणि वा परिमृज्य प्रतिस्वर यत्र शुष्कगोमयम् असंस्पर्शयन् धारयति तत् प्रदीप्यते। सः अयमेव सम्पद्यते अथापि आह वैश्वानरो यतते सूर्येण इति।।[16]
ऐतरेयब्राह्मणस्य[17] कथनमस्ति यत् ''अग्निः सर्वाः देवताः'' अर्थात् अग्नि एव सर्वेषु देवेषु मुख्यो वर्तते। अथवा अग्नेः कथनेन एव अन्येषां ग्रहणं भवति। ऋग्वेदस्य एका ऋचा अस्य ब्राह्मणवचनस्य अधिकं समर्थनार्थं प्रमाणरूपेण दत्ता वर्तते। यथा–

इन्द्रं मित्रं वरुणमग्निमाहुरथो दिव्यः स सुपर्णो गरुत्मान्।
एकं सद्विप्रा बहुधा वदन्त्यग्निं यमं मातरिष्वानमाहुः।।[18]

यत् अग्निरेव इन्द्रं मित्रं वरुणमादिनामभिः ज्ञायते। तथा अग्निरेव दिव्यदिविज अर्थात् द्युलोकवासी, सुपर्ण अर्थात् पतनशीलः, गरुत्मान् अर्थात् स्तुतियुक्त अथवा रसान् यः आकर्षयति स आदित्य अपि प्रसिद्धाग्निरेवाऽस्ति। अयमेकमग्निमेव मेधावी तथा आत्मज्ञानी जनाः अनेकैः नामभिः आह्वयन्ति। यथा यम तथा मातरिश्वादि देवाः।
पश्चात् कथितं वर्तते यत् निस्सन्देहेन अनेकानां नामानि अग्निः वर्तते। यथा– विद्युत, आदित्यादि अपि अग्नि अस्ति, किन्तु गौणरूपेण। गौणीवृत्या एते अग्निनाम्ना व्यवहृताः सन्ति। किन्तु वास्तवरूपेण एषः पार्थिवाग्निरेव अग्निरस्ति।
अथ असौ आदित्यः– इति पूर्वे याज्ञिकाः। एषा लोकानां रोहेण, सवनानां रोहः आग्नातः। रोहात्प्रत्यवरोहः चिकीर्षितः ताम् अनुकृति होता अग्निमारुते शस्त्रे, वैश्वानरीयेण सूक्तेन[19] तथा वर्षाकर्मणा वैश्वानरस्य स्तुतिः कृता वर्तते, अत एषः मध्यमाग्नि अर्थात् विद्युत् अस्ति तदपि उचित नास्ति। कारणं अस्मिन पार्थिवाग्नौ एव सर्वम् उपपद्यते। अग्रिमे मन्त्रे वर्णितमस्ति। यथा–

समानमेतदुदकमुच्चैत्यव चाहभिः।
भूमि पर्जन्या जिन्वन्ति दिव जिन्वन्त्यग्नयः।[20]

समानम्– एकमेवेदम्, उदकम्–उदकत्वेनाविशिष्टम् उच्चैत्यवचाहभिः। उत् एति च ऊद्वघ्वं चैति। अहोभिर्निमित्तभूतैः पुनश्च अहोभिरेव अवाम् एति नीचैरागच्छति। भूमिं पर्जन्या माध्यमिका देवगणा जिन्वन्ति–तर्प्यन्ति, ओषधयुत्पत्तये एवं तावदवाम् एति। यथैवामुतो वर्षेणेमां पर्जन्या जिन्वन्ति तथैवाहुति प्रभावेण वर्षेण दिवं जिन्वन्त्यग्नयः आहुतयो हयग्नौ प्रक्षिप्ताः पुनर्वर्षं प्रकल्पयन्ति।
आग्नेयेषु एव हि सूक्तेषु वैश्वानरीयाः प्रवादाः भवन्ति अग्निकर्मणा च एनं स्तौति। इति दहसि, इति वहसि, इति पचसि इति यथो एतत्–वर्षकर्मणा हि एनं स्तौति ''इति अस्मिन् अपि एतत् उपपद्यते।[21]
सर्वे देवाः अग्नौ एव सन्निहिताः सन्ति। द्युलोके यः अग्नि अस्ति सः सौराग्निरस्ति। अन्तरिक्षलोके य अग्निरस्ति सः विद्युताग्नि अस्ति। वृक्षेस्थित अग्निः दावाग्निः वर्तते, जलेस्थित अग्निः वडवानलाग्निरूपेण व्यवह्रियते तथा शरीरेस्थित अग्निः जठराग्निरूपेण ज्ञायते। अतः वक्तुं यत् ''अग्निरेव सर्वाः देवताः।''

The International Journal of Current Advanced Research (IJCAR) (SJIF Impact Factor 2017: 6.614) is one of the leading open access publisher, with hundreds of papers published each year related to different areas ranging from **Life Sciences, Physical Sciences and Engineering, Social Science and Humanities and Health Science.** The core vision of IJCAR is to promote knowledge and technology advancement for the benefit of academia, professional research communities and industry practitioners. The aim is to support you to achieve success in your research and scholarly experience.

Researchers, PhD scholars and professionals from academia and industry are solicited to submit completed research and developments in the listed areas below. With a large research community of authors, readers, editors and reviewers bounded together by their talent and integrity, IJCAR publications are available online freely for everyone worldwide. All published papers undergo high-quality peer review and rigorous editorial processes.

The International Journal of Current Advanced Research is an Open Access journal since 2012 with high citations in Google Scholar. This journal is indexed in ESCI - IP & Science - Thomson Reuters - Web of Science.

Multidisciplinary Journal covers all Subjects:

Life sciences : Agricultural, Biological Sciences, Biotechnology, Biochemistry, Genetics, Molecular Biology, Environmental Science, Ecology, Arachnology, Biodiversity and Conservation, Entomology, Limnology, Ichthyology, Malacology, Immunology and Microbiology, Neuroscience, Marine Biology.

Health Sciences: Medicine and Dentistry, Nursing and Health Professions, Pharmacology and Toxicology, Pharmaceutical Science, Veterinary Science, Veterinary Medicine, the Journal invites original papers, review articles, technical reports and short communications that are not published or not being considered for publication.

Physical, Chemical Sciences & Engineering: Chemical Engineering, Chemistry, Computer Science, Earth and Planetary Science, Energy, Mathematics, Physics and Astronomy, Engineering, Material Science, Statistics.

Arts and Humanities: Arts and Humanities, Business Management, Hotel Mangement, Management, Tourism, Accounting, Decision Science, Education, Economics, Law, Finance, Psychology, Political Science, English Literature, Hindi Literature, Sanakrit Literature and History, etc.

Accounting & Commerce: Business and Marketing, Economics, Financial Development, Accounting, Banking, Management, Human Resources etc.

IJCAR – Benefits to paper publications:

- Easy & Rapid paper publishing process.
- Publication within a short period after acceptance.
- Updates about your manuscript delivered via e mail and SMS.
- Peer-Reviewed Open Access Journal.
- Low publication fee to promote the research work
- Papers abstract/indexed by all the major scientific indexing services.
- IJCAR provides individual Soft Copy of Certificate of Publication to each Authors of paper.
- Original article will be download (PDF) from the www.journalijcar.org

Features:

- Platform to share knowledge in front of the world
- Encouraging research work
- Platform to showcase your research
- dedicated specialist review team
- cross cultural focus
- lowest publication fee to promote the research work

Himachal Pradesh University, Shimla, H.P., India.ruchiverma108@gmail.com

Abstract

Training is a continuous process in improving the caliber and skills of employees at the workplace. It is an attempt to improve their current and future performance but the organization should keep a track on their performance after imparting them training it means training needs assessment (Janice A. Miller, 2002) it is a systematic process of altering the behavior of employees in a direction to achieve the organization's goals. The aim of any training program is to provide instruction and experience to new employees to help them reach the required level of performance in their jobs quickly and economically. In order to meet the ever-growing and challenging needs of business and household banking has to become dynamic and updated in modern scenario and also to take up this industry to the heights of international excellence requires best combination of new technology and skillful and talented manpower. The objective is to examine the effectiveness of training programmes for employees in fulfillment of their duties. Present research paper is of descriptive type and based on primary data collected through questionnaire filled by the bank employees. The present paper explained some suggestions to enhance training strategies in the banking sector, and to cope up with the existing challenges in the wake of severe competition in the training and development. The findings of the study suggest that training is inevitable and unavoidable in any sector.

Keywords: Training, Banks, State Bank of India, Human Resource Management, Employees.

Training is the act of increasing the knowledge and skills of an employee for performing a particular job. The major outcome of training is learning. A trainee learns new habits, refined skills and useful knowledge during the training that helps him improve performance. Training enables an employee to do his present job more efficiently and prepare himself for a higher level job. (V S Rama Rao, 2010)

After employees have been selected for various positions in an organizations training them for the specific tasks in which they have been assigned assumes great importance. It is true in many organizations that before an employee is fitted into a harmonious working relationship with other employees, he is given adequate training.

Training is an essential part in the human resource management practices as it helps to get an insight of the job by the new employees and also to understand work culture followed in the organization. To acquire knowledge in order to adopt any change in technology or any change affecting the working of organization. To get promotion as again change in nature of the work but increase in payment willincrease responsibility and challenges involved. To deal with the expansion and diversification where companies initiates other areas of business to gain their greater understanding. In order to satisfy consumers from all walks of life banks need to have efficient manpower which can be possible by offering them quality training, training program should keep pace with changing times it

WORK LIFE BALANCING IN BANKING SECTOR: PERCEIVED GENDER DISCRIMINATION

Dr. ArtiPanditDhawan* Anu Maher**
** Associate Professor, Centre for Evening Studies, H.P. University, Shimla.*
*** Research Scholar, H.P. University, Shimla.*

Abstract
In India, it is assumed that activities related to earning of living are solely the entitlement of males while domestic work, child bearing and child rearing are the lone employments of women. Traditionally, women in India have not enjoyed a good standing in workplace settings whether in administrative or operational roles. Women have been loaded with work of all sorts all through their lives. Among fast growing developing countries, India is characterized for the role of the service sector. Going by the same theme, this study has been undertaken focusing on women employees of service sector. The idea was simply to examine if gender based perceived discrimination takes place when it comes to work life balancing. A sample of 410 employees working in banking sector was selected including 197 male and 213 female respondents. Their responses on various aspects of work life balancing were collected and tested for discrimination with the help of chi square test. Results have indicated a clear discrimination with some of the aspects of work life balancing like Job Autonomy, Job Demands, Job Time, Job Security, Job Stress, Personal Financial Strain, and Organization Commitment.

Key Terms: Work Life Balancing, Gender Discrimination, Job Demands.

Introduction

The balance between private and professional life is one of the essential ingredients of well-being and job satisfaction. Nevertheless, this balance is sometimes difficult to find. An important aspect of the balance between work and private life is the time spent at work. Data shows that heavy schedules can affect the health, jeopardize the safety and increase stress. At nearly 13%, the average number of employees working 50 hours or more per week is not very high in all of the OECD. Turkey is by far the country where the percentage of employees working very long hours, with 39%, the highest; It is followed by Mexico, with nearly 28%, and Israel, with one sixth of employees. Overall, there are more men working very long hours than women, and the percentage of employees working very long hours in the OECD countries reached 17% among men, against 8% in women[1].In addition, more a person works, the less it spends time in other activities, whether leisure or time for oneself. The amount and quality of leisure time are important factors of general well-being of an individual and can provide additional benefits in terms of physical and mental health. Devoting fewer hours in paid work does not necessarily mean for women they have more leisure, because men and women devote approximately the same time in twenty OECD countries studied[2].

Among the difficulties encountered by employees, balancing work and personal life regularly comes first. The social surveys and barometers carried out by the employers are unanimous on this point and, obviously, the days of RTT (Reduction in Total Work Time) are not always enough to find a good balance. While working time has been on an upward trend for more than a century, the Indian worker's sleeping time is also shrinking, as is the number of children in couples, how is it that the equilibrium between work and personal life is particularly problematic today? First of all, the official working time does not always correspond to the actual working time. Even when the latter is precisely measured, an employee cannot badge if he carries work at home at night or on weekends. In addition, some say they do not have time to take all their days off and RTT.

Then, work has intensified since the 1990s due to productivity imperatives, pressure from customers who are increasingly impatient, the need to be hyper-reactive to market changes and, finally, new technologies. Thus, time seems to be accelerating. There is less and less "time out" since employees can now, for the most part, work everywhere and all the time.Finally, the share of the labor force working at non-standard working hours is steadily increasing.

Particularly in case of women employees, we should not forget the effect of family changes. To this must be added the social pressure which demands, for example, that a woman be both an excellent mother with her children, an excellent wife with her spouse, an excellent daughter with her parents, an excellent employee, an excellent friend etc.The growth of divorces, single-parent families and blended families generally makes it even more difficult to balance work and personal life. Moreover, this conciliation is complex, because our ambition is extremely high: we want everything right away.

Problem Definition: This study has been organized and designed with the specific objective of how male and female employees in banking sector perceive various aspects of work life balancing. An effort has been made to examine if male and female employees differ on their perceptions related to aspects of work life balancing.

IMPACT OF WORK LIFE BALANCE ON JOB SATISFACTION AMONG BANK EMPLOYEES

Dr. ArtiPanditDhawan* **Anu Maher****
**Associate Professor, Centre for Evening Studies, H.P. University, Shimla.*
***Research Scholar, H.P. University, Shimla.*

Abstract
Work life balancing has now been considered seriously across corporate sector after many studies hinted out at positive relationship between work life balance and job satisfaction. Many corporations are devising policies which actually help to strike a reasonably good balance between work and personal life of employees. Going by the same theme, this study puts forth the banking scenario in India. The objective was to examine the impact of work life balance on the levels of job satisfaction of employees providing services in banking sector. Regression analysis has been utilized to assess this impact. Results have shown a positive relationship between work life balance and job satisfaction. Also major determinants in this relationship have been found to be job autonomy, organizational work life support, personal financial condition, job involvement and opportunities for advancement. Surprisingly, various other factors like Job Demands, Job Time, Job Security, Job Stress, Household Demands, Family support, Family to work spillover, Attitude towards Gender, Work to Family Role Spillover, Support from Colleagues, and Support from Superior did not show any significant impact over the levels of job satisfaction of banking sector employees.

Key Terms:Work Life Balance, Job Satisfaction, Job Autonomy, Job Involvement.

Introduction

Work-life balance is used to describe the equilibrium between responsibilities at work and responsibilities outside paid work; having a work-life balance means that this equilibrium is in the right position for the individual concerned. For some people it means spending more time in paid work and less time at home, while for others it means ensuring that paid work does not infringe on time needed for other responsibilities. It is about managing our work commitments with career goals, and our responsibilities at home and the wider community. Work life and personal life are inter-connected and interdependent. As per (Noor, 2011), Work-life balance has always been a concern of those interested in the quality of working life and its relation to broader quality of life. The term 'work-life balance' is much contested in itself. Attempting to clarify its meaning prompts a further problem: 'what constitutes 'good' work-life balance? This section will summarize some of the problems surrounding both of these issues, before providing a number of frameworks that have been developed from a number of different perspectives.

The role of work has changed throughout the world due to economic conditions and social demands. Originally, work was a matter of necessity and survival. Throughout the years, the role of "work" has evolved and the composition of the workforce has changed. Changes in the social, political and economic fabric of societies have influenced and continue to influence both the nature of employment and its relationship to life outside work.Today, work still is a necessity but it should be a source of personal satisfaction as well. One of the vehicles to help provide attainment of personal and professional goals is work-life benefits and programs. Keeping this theme in mind, a study on work life balancing and its impact on job satisfaction has been conducted for employees working in banking sector.

Review of Literature

For the purpose of review of empirical studies, the review segment has been divided in two parts. First part covers studies related to work life balancing among employees. Second part focuses on job satisfaction and also impact of work life balancing on the job satisfaction level.

A. Work Life Balance

Work life balance practices are organizational changes intended to lessen work family conflict. These work lifebalance practices enable workers to be effective in bothwork and private roles. The additional control an employee has ontheir lives the more able they are to strike a balance between work and family.Iqan lazar, 2010 concludes that, a successful balance betweenwork and non-work roles are beneficial for both employee andemployer. And this balance in work and life domains enhancesquality of personal relationship and organizational outcomes.

According to Susi.S, 2010 work life balance is drive forsatisfaction of employees. Many organizations feel the need ofwork life balance which include retention of valuable workforce, reduce work family conflict, and reduce employeestress, job satisfaction and better life balance. Work lifebalance practices need to be supported and encouraged atworkplace culture. Strong and supportive organizationalculture increase employee intent to remain in the organization.(Felicity Asiedu-Appiah, 2013) concludes that work lifebalance is important in enhancing employee performance atwork and home. Gender difference

Training as Human Resource Development (HRD) Mechanism in H.P. Police

Dr. Arti Pandit Dhawan
Associate Professor (Commerce)

HPUCES, The Mall, Shimla,
Himachal Pradesh.

Abstract:

Police service is a part of public service in India. But the nature of the services somewhat different forms other categories of public services, as it is entrusted with the tasks of maintaining law and order. This task makes the policeman and agent of enforcing law & order who also has to play a role in protecting and defending the rights and liberty of citizens. Of late the policeman has also become an agent of social change by executing various social legislation. Since the job of a policeman is, in general, rough and tough, it requires the particular type of training in order to deal with situations rising from peculiar problems such as combating terrorism, drug peddling, heinous crimes, smuggling and communal riots. These problems demand a policeman to be physically fit and mentally alert. All these techniques cannot simply be learned by trial and error and hence it requires a particular type of training needed for policeman. Training to policeman has to bring greater efficiency and effectiveness, in his job. The police job entails the handling of critical and essential situations including decision making, therefore, problem solving training should be providing on continuous basis so that they develop proficiency in their skill, modify their behaviour and attune themselves to the tasks challenging them from time to time. Training has to prepare them for leadership because a lot depends upon the way the leader leads and his subordinate's behave. Training helps in bridging the gap between the existing performance ability and desired performance. Training generally aims at improved individual performance, improved job satisfaction and improved organizational effectiveness. The purpose of training according to the modern approach is the continuous development of individuals towards their full and unique potential through their life span and thus the continuous development of human resources. In this paper an attempt has been made to study training as HRD mechanism in H.P .Police.

WORK LIFE CONFLICT: AN ANALYTICAL STUDY OF WORK SPILL OVER AND LIFE SATISFACTION OF WOMEN EMPLOYEES IN BANKING SECTOR

Dr.Arti Pandit Dhawan
Associate Professor

H.P.U.C.E.S

Anu Maher
Research Scholar

Abstract
The role of work has changed throughout the world due to economic conditions and social demands. Originally, work was a matter of necessity and survival. Throughout the years, the role of "work" has evolved and the composition of the workforce has changed. Changes in the social, political and economic fabric of societies have influenced and continue to influence both the nature of employment and its relationship to life outside work. Today work still is a necessity but it should be a source of personal satisfaction as well. One of the vehicles to provide attainment of personal and professional goals is work life benefits and programmes Work life balance has always been a concern of those interested in the quality of working life and its relation to broader quality of life (Noor,2011). Work-personal life conflict occur when the burden, responsibilities and liabilities of work and family roles become incompatible or irreconcilable. There occurs conflict between life inside and work outside. In the context of work life balance, spill over refers to positive or negative effects of an individual's working life on their personal life or family life and vice versa. Life satisfaction is a measure of well-being and may be assessed in terms of mood, satisfaction with relations with others and with achieved goals, self-concepts, and self-perceived ability to cope with daily life. Lack of work flexibility, work burden and longer working hours are stressing out many women employees. In this paper an attempt has been made to analyse the sensitivity of women employees in banking sector regarding work spill over and life satisfaction.
Keywords: *Perception, Spill over, Life satisfaction.*

Introduction

In India, it is taken for granted that economic activities are exclusively the prerogative of males while domestic work, child bearing and child rearing

Abstract
Work life balancing has now been considered seriously across corporate sector after many studies hinted out at positive relationship between work life balance and job satisfaction. Many corporations are devising policies which actually help to strike a reasonably good balance between work and personal life of employees. Going by the same theme, this study puts forth the banking scenario in India. The objective was to examine the impact of work life balance on the levels of job satisfaction of employees providing services in banking sector. Regression analysis has been utilized to assess this impact. Results have shown a positive relationship between work life balance and job satisfaction. Also major determinants in this relationship have been found to be job autonomy, organizational work life support, personal financial condition, job involvement and opportunities for advancement. Surprisingly, various other factors like Job Demands, Job Time, Job Security, Job Stress, Household Demands, Family support, Family to work spillover, Attitude towards Gender, Work to Family Role Spillover, Support from Colleagues, and Support from Superior did not show any significant impact over the levels of job satisfaction of banking sector employees.

Key Terms:Work Life Balance, Job Satisfaction, Job Autonomy, Job Involvement.

Introduction

Work-life balance is used to describe the equilibrium between responsibilities at work and responsibilities outside paid work; having a work-life balance means that this equilibrium is in the right position for the individual concerned. For some people it means spending more time in paid work and less time at home, while for others it means ensuring that paid work does not infringe on time needed for other responsibilities. It is about managing our work commitments with career goals, and our responsibilities at home and the wider community. Work life and personal life are inter-connected and interdependent. As per (Noor, 2011), Work-life balance has always been a concern of those interested in the quality of working life and its relation to broader quality of life. The term 'work-life balance' is much contested in itself. Attempting to clarify its meaning prompts a further problem: 'what constitutes 'good' work-life balance? This section will summarize some of the problems surrounding both of these issues, before providing a number of frameworks that have been developed from a number of different perspectives.

The role of work has changed throughout the world due to economic conditions and social demands. Originally, work was a matter of necessity and survival. Throughout the years, the role of "work" has evolved and the composition of the workforce has changed. Changes in the social, political and economic fabric of societies have influenced and continue to influence both the nature of employment and its relationship to life outside work.Today, work still is a necessity but it should be a source of personal satisfaction as well. One of the vehicles to help provide attainment of personal and professional goals is work-life benefits and programs. Keeping this theme in mind, a study on work life balancing and its impact on job satisfaction has been conducted for employees working in banking sector.

Review of Literature

For the purpose of review of empirical studies, the review segment has been divided in two parts. First part covers studies related to work life balancing among employees. Second part focuses on job satisfaction and also impact of work life balancing on the job satisfaction level.

A. Work Life Balance

Work life balance practices are organizational changes intended to lessen work family conflict. These work lifebalance practices enable workers to be effective in bothwork and private roles. The additional control an employee has ontheir lives the more able they are to strike a balance between work and family.Iqan lazar, 2010 concludes that, a successful balance betweenwork and non-work roles are beneficial for both employee andemployer. And this balance in work and life domains enhancesquality of personal relationship and organizational outcomes.

According to Susi.S, 2010 work life balance is drive forsatisfaction of employees. Many organizations feel the need ofwork life balance which include retention of valuable workforce, reduce work family conflict, and reduce employeestress, job satisfaction and better life balance. Work lifebalance practices need to be supported and encouraged atworkplace culture. Strong and supportive organizationalculture increase employee intent to remain in the organization.(Felicity Asiedu-Appiah,

WORK LIFE BALANCING IN BANKING SECTOR: PERCEIVED GENDER DISCRIMINATION

Dr. ArtiPanditDhawan* Anu Maher**
** Associate Professor, Centre for Evening Studies, H.P. University, Shimla.*
*** Research Scholar, H.P. University, Shimla.*

Abstract
In India, it is assumed that activities related to earning of living are solely the entitlement of males while domestic work, child bearing and child rearing are the lone employments of women. Traditionally, women in India have not enjoyed a good standing in workplace settings whether in administrative or operational roles. Women have been loaded with work of all sorts all through their lives. Among fast growing developing countries, India is characterized for the role of the service sector. Going by the same theme, this study has been undertaken focusing on women employees of service sector. The idea was simply to examine if gender based perceived discrimination takes place when it comes to work life balancing. A sample of 410 employees working in banking sector was selected including 197 male and 213 female respondents. Their responses on various aspects of work life balancing were collected and tested for discrimination with the help of chi square test. Results have indicated a clear discrimination with some of the aspects of work life balancing like Job Autonomy, Job Demands, Job Time, Job Security, Job Stress, Personal Financial Strain, and Organization Commitment.

Key Terms: Work Life Balancing, Gender Discrimination, Job Demands.

Introduction

The balance between private and professional life is one of the essential ingredients of well-being and job satisfaction. Nevertheless, this balance is sometimes difficult to find. An important aspect of the balance between work and private life is the time spent at work. Data shows that heavy schedules can affect the health, jeopardize the safety and increase stress. At nearly 13%, the average number of employees working 50 hours or more per week is not very high in all of the OECD. Turkey is by far the country where the percentage of employees working very long hours, with 39%, the highest; It is followed by Mexico, with nearly 28%, and Israel, with one sixth of employees. Overall, there are more men working very long hours than women, and the percentage of employees working very long hours in the OECD countries reached 17% among men, against 8% in women[1].In addition, more a person works, the less it spends time in other activities, whether leisure or time for oneself. The amount and quality of leisure time are important factors of general well-being of an individual and can provide additional benefits in terms of physical and mental health. Devoting fewer hours in paid work does not necessarily mean for women they have more leisure, because men and women devote approximately the same time in twenty OECD countries studied[2].

Among the difficulties encountered by employees, balancing work and personal life regularly comes first. The social surveys and barometers carried out by the employers are unanimous on this point and, obviously, the days of RTT (Reduction in Total Work Time) are not always enough to find a good balance. While working time has been on an upward trend for more than a century, the Indian worker's sleeping time is also shrinking, as is the number of children in couples, how is it that the equilibrium between work and personal life is particularly problematic today? First of all, the official working time does not always correspond to the actual working time. Even when the latter is precisely measured, an employee cannot badge if he carries work at home at night or on weekends. In addition, some say they do not have time to take all their days off and RTT.

Then, work has intensified since the 1990s due to productivity imperatives, pressure from customers who are increasingly impatient, the need to be hyper-reactive to market changes and, finally, new technologies. Thus, time seems to be accelerating. There is less and less "time out" since employees can now, for the most part, work everywhere and all the time.Finally, the share of the labor force working at non-standard working hours is steadily increasing.

Particularly in case of women employees, we should not forget the effect of family changes. To this must be added the social pressure which demands, for example, that a woman be both an excellent mother with her children, an excellent wife with her spouse, an excellent daughter with her parents, an excellent employee, an excellent friend etc.The growth of divorces, single-parent families and blended families generally makes it even more difficult to balance work and personal life. Moreover, this conciliation is complex, because our ambition is extremely high: we want everything right away.

Problem Definition: This study has been organized and designed with the specific objective of how male and female employees in banking sector perceive various aspects of work life balancing. An effort has been made to examine if male and female employees differ on their perceptions related to aspects of work life balancing.

HUMAN RESOURCE DEVELOPMENT (HRD) PRACTICES IN DISTRICT CIVIL ADMINISTRATION

Dr. Arti Pandit Dhawan
Associate Professor, Department of Commerce, HPU Centre for Evening Studies, The Mall Shimla H.P.

Abstract
The present form of district is a mixed creation of Mughal and British but as a unit of administration it existed in India much before the beginning of Christian era. District has been the nodal point of the administrative system in India for about two hundred years. Administrative Reforms Commission has stated that "Need for changes in the machinery of government and its personnel have been felt to be compelling. It is equally clear that adhoc or peripheral administrative improvisations are doomed to be inconsequential and even futile and what is needed are the basic changes in the system and spirit of government as inherited from the British. Proper attitudes are to be cultivated by the country's bureaucracy and government in power. This should synchronize with re-determination of government hierarchies as well as of business methods. In addition to the structure and processes, the contents of administration require to be determined much more rationally." Human Resource Development (HRD) practices do make a difference in many ways. These practices enhance the internal capabilities of an organization to deal with current and future challenges faced by an organization.

Keywords: Human Resource Development, District Administration, Future Challenges.

Introduction

According to the introductory prologue to the "The Administrative Reforms Commission, compilation by Dr. S.R. Maheshwari , administration is a mechanism which the society, through its agency, government has designed and brought into existence to translate its volitions into fulfillment, when there is a conglomeration of resolutions continuing seeking almost simultaneously realization, this mechanism acquires an obvious and increasing influence, even urgency in the smooth functioning of the social order. Volume, nature and variety of desires released at a given time depend essentially on the stage of political development and maturity reached in the society. Society speaks through the government and the government activates itself through public administration".

Administrative Reforms Commission has further stated that "need for changes in the machinery of government and its personnel and its personnel have been felt to be compelling. It is equally clear that adhoc or peripheral administrative improvisations are doomed to be inconsequential ,even futile and what is needed are basic changes in the system and spirit of government as inherited from the British. Proper attitudes are to be cultivated by the country's bureaucracy. This should synchronize with re-determination of government hierarchies as well as of business methods. In addition to the structure and processes, the contents of administration require to be determined much more rationally."

Review of Literature

In the context of the present study it is important to take cognizance of the studies related to research problem under study.

Shastri (1957) has analysed that collector of the district occupies cardinal position in the administration. He is the local representative of the government. He is the head of the revenue department in the district; he is the executive district magistrate and keeps in general touch with the working of all the departments in the district.

Khera (1964) has studied that the district in India is in many ways the most important unit of field administration in the country. It in a convenient geographical unit, where there can be concentrated the total apparatus of public administration it provides a practical method for management of public affairs in a country like India. It is many ways the result of history. It has stood the test of time and time provides some very severe tests for all forms of organisations everywhere. Shukla (1976) has enumerated a comparative study of variations in administration setup in different states and their implication have also been noted and compared.

Pareek and Rao (1981) have emphasized that human resource system requires a different type of emphasis on analysis of the roles, (key performance areas and critical attributes), matching to the role of person (recruitment placement and promotions) developing the person in the role (performance appraisals, feedback and counseling and training), potential appraisals, carrier development and planning, developing a role for a person(job rotation, job enrichment , job design and redesigning) and role of effectiveness etc.

Sharma (1992) has studied that development being an ideology has to be pursued vigorously in order to fulfill pledges and commitments made to the toiling millions by our national leaders. Ashwa Thapa (2000) has provided a refreshing and awarding in sight into the management of human resources and focuses on the strategic human resource management, human resource planning training and development.

HRD CLIMATE AND OCTAPACE CULTURE: CHANGE AGENTS FACILITATING GOOD GOVERNANCE

Dr. Arti Pandit Dhawan
Associate Professor (Commerce)
HPUCES, The Mall, Shimla, Himachal Pradesh.

Abstract

Good governance is possible by managing people through human approach and touch. The concept of good governance is not static but a dynamic one, as it keeps changing due to overall societal changes. Good governance implies utmost concern for people's welfare wherein the government and its bureaucracy follow policies and discharge their duties with the deep sense of commitment, respecting the rule of law in a manner which is transparent, ensuring human rights and dignity and public accountability. HRD Climate can be defined as the employee's perception about the environment of their organization. Various HRD instruments create a climate conducive to achieve organizational effectiveness HRD Climate is an integral part of organizational climate. Good governance process should be efficient, effective, economical, ethical, equitable, reasonable, fare and people caring. It implies gearing up the government machinery to provide a responsive, transparent, clean and people friendly administration. For good governance, there has to be openness and transparency, de-bureaucratization by changing the mind set of functionaries, improved skills, enhanced capabilities, better performance, free from corruption, de-centralized management, better budgeting, accounting and auditing, efficiency and accountability. In view of above it can be concluded that HRD climate consisting of OCTAPACE culture is a facilitator for good governance.

Key words: Good Governance, HRD Climate, OCTAPACE Culture.

Introduction

According to H.K. Asmeron et al, "Good Governance is associated with efficient and effective administration in a democratic framework". Good Governance is said to have following eight characteristics: it is participatory, consensus-oriented, accountable, transparent, responsive, effective and efficient, equitable and inclusive and follows the rule of law.

The World Bank, for the first time in 1989, highlighted the concept of good governance. By good Governance, it meant sound public management, and in this context identified four dimensions:

Training as Human Resource Development (HRD) Mechanism in H.P. Police

Dr. Arti Pandit Dhawan
Associate Professor (Commerce)
HPUCES, The Mall, Shimla,
Himachal Pradesh.

Abstract:

Police service is a part of public service in India. But the nature of the services somewhat different forms other categories of public services, as it is entrusted with the tasks of maintaining law and order. This task makes the policeman and agent of enforcing law & order who also has to play a role in protecting and defending the rights and liberty of citizens. Of late the policeman has also become an agent of social change by executing various social legislation. Since the job of a policeman is, in general, rough and tough, it requires the particular type of training in order to deal with situations rising from peculiar problems such as combating terrorism, drug peddling, heinous crimes, smuggling and communal riots. These problems demand a policeman to be physically fit and mentally alert. All these techniques cannot simply be learned by trial and error and hence it requires a particular type of training needed for policeman. Training to policeman has to bring greater efficiency and effectiveness, in his job. The police job entails the handling of critical and essential situations including decision making, therefore, problem solving training should be providing on continuous basis so that they develop proficiency in their skill, modify their behaviour and attune themselves to the tasks challenging them from time to time. Training has to prepare them for leadership because a lot depends upon the way the leader leads and his subordinate's behave. Training helps in bridging the gap between the existing performance ability and desired performance. Training generally aims at improved individual performance, improved job satisfaction and improved organizational effectiveness. The purpose of training according to the modern approach is the continuous development of individuals towards their full and unique potential through their life span and thus the continuous development of human resources. In this paper an attempt has been made to study training as HRD mechanism in H.P .Police.

***

Defining Training and Development

Training is the act of increasing the knowledge and skills of an employee for doing a particular job. The major outcome of training is learning. A trainee learns new

Role of NGOS in Rural Development of Himachal Pradesh

[*]Prof. Usha Sharma, [#]Bittu Kumari

[*]Professor, [#]Assistant Prof. and Research Scholar, Deptt. Of Commerce, Himachal Pradesh University, Shimla, India.

ABSTRACT - Rural development generally refers to the process of improving the quality of life and economic well-being of people living in relatively isolated and sparsely populated areas. Rural development has traditionally centred on the exploitation of land-intensive natural resources such as agriculture and forestry. Rural development actions are mainly and mostly to development aim for the social and economic development of the rural areas.Rural development programs are usually top-down from the local or regional authorities, regional development agencies, NGOs, national governments or international development organizations. India is a land of villages and the Government of India has been implementing numerous rural development programmes for the upliftment of rural Communities. A number of NGOs have been playing a vital role in rural community development, besides government interventions. Realizing that the government alone was not able to meet the challenges of the massive enormous tasks in the process of rural development, the non-profit, voluntary and non-governmental organizations had to be involved in different phases and activities at the global, regional and local levels. The NGO sector effectively works towards uplifting the socio-economic status of the poor.

KEYWORDS: Rural Development, government, NGO, rural development. Schemes.

I. INTRODUCTION

India is rightly regarded as the land of villages. In a country where 75% of the population lives in villages, the importance of rural development is self-evident. Rural development programmes are designed to facilitate a multi-faceted growth of the rural poor by providing the benefits of development to them and the improvement of their living standards. After independence and particularly after the constitution came into force the government has initiated a number of programmes to solve the chronic problems facing villages in India. Soon after independence, in the early stages, efforts were made through Community development programme, democratic decentralization and Panchayati raj were made to eradicate poverty and hunger from the rural India and to usher in all round development of rural masses. It should be noted that all these rural development programmes were synonymous with agricultural development. This followed the worldwide thinking and India's excessive concern, especially till the Green Revolution in the late 1960s, with the food self-sufficiency. Later on it was realised that rural development is much broader in scope than merely agriculture development. Therefore, if the strategy for rural development had to be made effective, a multi – pronged approach to rural problems was imperative. The Panchayati raj institutions did not help much the weaker sections of the society due to domination and control of higher castes in these bodies, therefore, after the evaluation of earlier programmes, a number of special programmes were taken up for poverty alleviation in the hope that benefits of these programmes may reach the people living below poverty line.

1.2.1.1 RURAL DEVELOPMENT PROGRAMMES

Special Development programmes which were directly or indirectly designed for the uplift of socio-economic conditions of the rural people. Broadly, these programmes fall under the following three categories-

1. Area based programmes to counter endemic poverty due to hostile Argo climatic conditions and degeneration of ecosystems, such as Drought prone Areas Programme, Desert Development Programme and Hill Area Development programme come under this category.
2. Targeted group of individual house-hold and poverty group-oriented programmes of income generation through assets and skills endowment. The Integrated Rural Development programme, The national Rural Employment Guarantee Programme, Rural landless Employment Guarantee programme and Jawahar Rozgar Yojana being run by the Ministry of Rural Areas and Employment belong to this category.
3. The Minimum Needs programme to support the poverty groups by providing for sufficient consumption and social services to improve the quality of life and to

 DOI : 10.35291/2454-9150.2019.0282 © 2019, IJREAM All Rights Reserved.

provide infrastructural support to the programme of poverty alleviation.

1.2.1.2 IMPLEMENTATION AGENCIES

Implementation of programmes, plans, reforms, policies etc. is a serious problem. The success of public administration for development can be measured only in relation to the implementation of programmes etc. Thus, implementation is the key to the success of government. Implementation is the phase between a decision and operation. It seeks to determine whether an organization is able to carry out and achieve its stated objectives. Thus, implementation, as putting programmes into action, is difficult exercise.

The main agencies which are implementing the Integrated rural development programme are-

- Central Government
- State Government
- District Level
- Block Level
- Panchayati Raj Institutions
- **Voluntary Agencies.**

Today the voluntary agencies are playing an important role in rural development. Such voluntary agencies should be strengthened and encouraged at the village level, block and district levels. In 1991, there were 44 agencies that were involved in the process of rural development. The examples of some of them are The farmers Service Societies, The Council for Advancement of People's Action and Rural Technology, etc.

The voluntary agencies have emerged as a main instrument for awareness generation among masses and as a an instrument for the implementation of the government policies. Therefore, it becomes imperative to study these voluntary agencies/NGOs at Global, national and regional level and their roles which they play in various areas so that the working of these agencies can be further strengthened. The present study focuses on the role of these voluntary agencies in the rural development especially in Himachal Pradesh where most the people lives in rural areas.

II. DEFINITON OF NGO

A **non-governmental organization** (**NGO**) is an organization that is neither a part of a government nor a conventional for-profit business, usually set up by ordinary citizens, NGOs may be funded by governments, foundations, businesses, or private persons. Some avoid formal funding altogether and are run primarily by volunteers. NGOs are highly diverse groups of organizations engaged in a wide range of activities, and take different forms in different parts of the world. Some may have charitable status, while others may be registered for tax exemption based on recognition of social purposes. Others may be fronts for political, religious or other interest groups.

Recognition of the Role of NGOs by the Government

Since Independence in 1947 until the Sixth Five Year Plan (1980-85), there was little effort on the part of the Government to define the role of a voluntary agency or to recognise the importance of NGOs in the development process. The tendency until now was to equate the work of the voluntary agencies with only welfare activities and charity work.

Realising the importance of participatory development, the Sixth Five Year Plan Document, emphasised the importance of non-governmental organisations, formal and informal in nature, as new actors, which could motivate and mobilize people in specific or general developmental tasks and meet the new demands of the growing sphere of developmental activities. The new areas where awareness and conscious participation of the people is critical for success were identified as:

(a) optimal utilisation and development of renewable source of energy, including forestry through the formation of renewable energy associations at the block level
(b) family welfare, health and nutrition education and relevant community programmes in this field
(c) 'Health for all' programmes
(d) water management and soil conservation
(e) social welfare programmes for weaker sections
(f) implementation of minimum needs programme
(g) disaster preparedness and management (floods, cyclones, etc.)
(h) promotion of ecology and tribal development
(i) environmental protection and education

The new actors sought to be associated with these tasks were

(i) youth and women's organisations at different spatial levels, particularly for promoting eco-development and environmental protection
(ii) Voluntary organisations of specific beneficiary or interest groups like, self-employed women, or farmers or of people who have common economic interest such as marketing
(iii) Voluntary organisations engaged in general developmental work, in an area or a specific activity
(iv) Organisation of the farmers living in command area of irrigation projects, catchment area in the hills and watershed areas in un-irrigated regions into cooperatives for improving land and water management without affecting the individuality of holdings

 DOI : 10.35291/2454-9150.2019.0282 © 2019, IJREAM All Rights Reserved.

(v) Religious, social or cultural organisations or clubs (Rotary, Jaycees, Lions etc.) which often undertake developmental activities in selected areas

(vi) Professional organisations or educational institutions which take up study, research and social action programmes as part of their professional or social commitments.

Today India has a vibrant NGO sector. Although there has been no complete census of NGOs, their total number is roughly estimated at about 1,00,000 of which only 25,000 to 30,000 are active. The largest number of such organisations listed at one place is 12,313 NGOs registered with the Ministry of Home Affairs, Government of India under the Foreign Contribution (Regulation) Act (FCRA) 1976, as of 31st December, 1989, besides 726 unregistered NGOs under the 'prior permission category'. There has been astronomical increase in the number of NGOs during the past ten-fifteen years due to rising awareness and social concern, widespread poverty and deprivation, weakening governmental delivery mechanism, democratic spirit and increased funding.

The Seventh Plan (1985-90) envisaged a more active role for the voluntary organisations so as to make communities as self- reliant as possible. These were expected to show how village and indigenous resources could be used and how human resources, rural skills and local knowledge, grossly underutilised at present could be used for their own development. Further these were to be utilised to demystify technology and bring it in a simpler' form lo the rural poor, to train a cadre of grass-root workers who believe in professionalizing voluntarism, to mobilise financial resources from within the community and to mobilise and organise the poor and generate awareness to demand quality service and impose a community system, of accountability on the performance of village level government functionaries.

Role of NGOs in Rural Development

Voluntary organisations can play a crucial role in rural development by supplementing government efforts as they are close to the minds and hearts of the rural people. They have their roots in the people and can respond to the needs and aspirations of the community. They face problems in terms of funding, recruitment and retention of trained and qualified staff, leadership crisis, poor maintenance of records, apathy of bureaucracy and the tendency of politicians and others to use them for personal or political gains. Voluntary action and state are the two sides of the same coin of rural development administration and they must recognise their interdependence. In a country like India the voluntary organisations can provide only a starting point and impetus. The voluntary organisations and government should come to the negotiating table; and with mutual respect and maturity discuss on development issues as they both are to be viewed as partners in rural development

III. REVIEW OF LITERATURE

The seventh five year plan document (1985-90) envisaged a greater role of the voluntary agencies and the NGOs in the implementation of development. The seventh plan has given special importance to the role of NGOs in rural development. For the first time an amount of Rs. 50 crores has been allocated as financial assistance to voluntary agencies in their endeavour to uplift the rural poor. The Government of India has also encouraged the involvement of international voluntary agencies through coordinating agencies. The eighth five year plan document (1992-97) emphasized on the role ofvoluntary organizations in rural development. The plan document states that a nation-wide network of NGOs will be created. In order to facilitate the working of this network, three schemes relating to the creation, replication, multiplication and consultancy development have been worked out by planning commission. Further efforts will be made to evolve a system of providing one window service to the NGOs working in the area of integrated development.

Suresh Kumar Bhaker (2014) in his paper published in the journal of business and policy economics highlighted the role of NGOs in rural development of India. He studied the performance of 8 NGOs engaged in health, hygiene and sanitation field in Uttar Pradesh in India. The paper highlighted the performance evaluation h People's Participation. He concluded that there is a casual relationship between NGOs and rural development. Although there is not much change in the health indicators as result of NGOs efforts. But the health indicators are not only instruments to measure the work of NGOs. What the knowledge and views of villagers have been broadened towards health, hygiene and sanitation that can't be described in words. Moreover the positive efforts of these activities cannot be measured in a short span of time, but a lifelong effect on human body and personal life of the villagers. If the knowledge of health, hygiene and sanitation is strong and wide that will certainly develop the social and economic life of the villagers. If the rural areas are well developed that will make the country more developed. Thus the role of these NGOs cannot be assessed only through impact indicators or the services they provide, but should be assessed in a long and wide view for overall development.

D.S Jadhav (2015) studied the role of NGOs in rural development in India. According to him In India, the scope of development is not narrow but very wide, as it includes not just the economic development but the growth on social front, quality of life, empowerment, women and child development, education and awareness of its citizens. To achieve this, a holistic vision and collaborative efforts involving various departments, agencies and even NGOs is required. NGOs or Non-Governmental Organizations have

 DOI : 10.35291/2454-9150.2019.0282 © 2019, IJREAM All Rights Reserved.

more benefits of working in rural areas as compared to governmental organizations because NGOs are more flexible, NGOs are specific to a particular locality and moreover these are committed towards serving the public and community as a whole. Further he highlighted the main role of NGOs in rural development with economic reforms and liberalization. He reveals that as economic reform and liberalization saw the Government vacating several areas to let private sector entrepreneurship flourish and contribute to the high growth rate of the economy in recent years, a similar paradigm shift is needed to transform NGOs from their dependence on aid and grants from within and outside for transforming the rural scenario in the country. This is sought to be achieved for the NGOs through engaging them in micro-finance, micro insurance, and micro-entrepreneurship activities for the overall development of the rural areas and to promote the welfare of the people of rural India, The NGOs have taking active participation in rural development. The rural poor and socially depressed classes are mainly depending upon the operations of NGOs. No particular job is particularly meant for the NGOs. Thus, there is a huge competition among the NGOs to extend the services for the benefit of the poor. At the same time we should not forget the mushrooming of the NGOs for their welfare. The following are the important activities should take up for the development of the poor.

1. Agricultural related programs: Numerous activities can be undertaken under agriculture sector. The jobs/projects like distributing planting materials, cattle, poultry, minor irrigation, free medical care for cattle's, safe drinking water for animals etc.

2. Health programmes for human and non-human beings: The works like pit drainage, housing, creation of smokeless environment, good drinking water for animals and human beings, regular health check-up camps etc. will improve the health conditions of the human and non-human beings.

3. Community development programs: The community development programs like adoption of villages for development, moral support during flood and famine period, supply of food and drinking water during flood, common well, training programs for the rural youths, housing projects, repair and renovation of houses etc will satisfy the basic necessities. The important program like training programs for the rural poor will hold the youths from rural exodus. Even this type of training programs may also be extended for the rural women, so that we can expect self-sustenance among this community.

4. Human Resource Development programs: The personality development programs, skill development programs, educational programs, integrated development projects etc will enable the rural poor to earn bread and butter.

5. Trade and industrial promotion: The important problem in the present context is availability of the market for the products of rural enterprises. Therefore, an NGO has a direct link with the government for marketing of the goods. Apart from this, NGO can also go for training the rural youths in fabrication works, wood works, beedi rolling, agarbathi manufacturing, printing press etc.

R. Singhal (2015) in his paper discussed the effectiveness of non-governmental organizations (NGOs) and various models of organizational effectiveness (OE) that have been applied in NGOs. Furthermore, different viewpoints that emerged from research over the past four decades are synthesized. The review of models and research studies revealed little agreement among the academic community to conceptualize NGO effectiveness. While early studies focused on the assessment of NGO effectiveness highlighted organizational goals, contemporary studies focused on the processes that contribute to NGO effectiveness. Most of the studies found the governing board as a common dimension of NGO effectiveness. The paper conceptualized NGO effectiveness as a multi-dimensional social construct with an ability to achieve an organizational mission through a competent governing board, strong NGO-employee relationship, and efficient financial measures. The paper concluded that it is difficult to develop a universal standard definition of NGO effectiveness because NGOs work on diverse themes, issues, scales, and approaches. On the basis of the analysis, it is suggested that future research on NGO effectiveness should focus on specific cultures, focus, and scale of NGOs.

Uma Sarmistha (2015) conducted a research at Rural Handloom Textile **In**dustry in Bihar. He pointed out that the functioning of rural handloom sector will not be able to fit in the new- classical framework of labour Market and development studies. Thus, taking the point what Granovetter explain in his theory of embeddedness of middle path between over and under Socialisation, may help these societies move towards a better future. The Middle path can come with government initiatives in the region. He concluded that the Government can come up with some policy. Solutions such as creation of Some kiosks to distribute and collect the finished product and provide equal Remuneration to all weavers; (ii) strengthen the rural employment guarantee Programme to provide more jobs in rural areas; (iii) upscale technology in the weaving; and (iv) provide health care and other facilities in the village. This kind of middle path can give society a balanced path way to development, which would recognise.

P. Raghupathi (March 2016) studied the impact of rural Development programmes on Landless Dalits. The study found that there is large- scale arbitrariness, nepotism and manipulations in the selection of beneficiaries. According to the selection guidelines , the beneficiaries have to be selected from the actual BPL families but in reality the

 DOI : 10.35291/2454-9150.2019.0282 © 2019, IJREAM All Rights Reserved.

actual BPL family but in reality, the panchayat member and sarpanch arbitrarily select the beneficiaries. In a number of cases, the BPL list is manipulated. Therefore the BPL list must be prioritized according the level of income and landholding criterion or any other specified measure. The middleman who manipulate must be dealt with stringently in order to ensure fair selection of the beneficiaries. Thus a greater degree of transparency and accountability from the implementing authorities and better awareness and proper utilization of the benefits by the eligible beneficiaries would ensure better results.

IV. RESARCH DESIGN

NEED OF THE STUDY

In India, the scope of development is not narrow but very wide, as it includes not just the economic development but the growth on social front, quality of life, empowerment, women and child development, education and awareness of its citizens. The task of development is so huge and complicated that just implementing government plans is not sufficient to fix the problem. To achieve this, a holistic vision and collaborative efforts involving various departments, agencies and even NGOs is required. Owing to such a great need, the number of NGOs in India is increasing rapidly and, at present, there are about 25,000 to 30,000 active NGOs in India.

Superficially, rural development seems to be a simple task but, in reality, it is not. Post-Independence era has seen many rural development programs through different five-years plans. Alleviating poverty, employment generation, more opportunities for generating income, and infrastructure facilities are emphasized through the policies and programs of the government. Along with this, the panchayat raj institutions have also been initiated by the government to strengthen the democracy at grass roots level. But in spite of all the efforts rural poverty, unemployment rate, low production still exists. The fight is still on for the basic facilities such as livelihood security, sanitation problem, education, medical facilities, roads, etc. Still there is a huge gap in terms of infrastructure that is available in urban and rural areas. The basic rural development should include all these apart from employment, proper water supply and other basic facilities.

NGOs or Non-Government Organizations have more benefits of working in rural areas as compared to governmental organizations because NGOs are more flexible, NGOs are specific to a particular locality and moreover these are committed towards serving the public and community as a whole. As the task of development is massive, many NGOs are playing vital role in the rural development of India in collaboration with the government. The Government openly welcomed and encourages participation of the NGO's in development process. Now international agencies like World Bank, which was earlier working exclusively through national government prefers to work through the NGOs for the implementation of their projects. This makes clear that NGOs have gained prominence in the present times. So, it becomes essential to see the extent of the role played by the state NGOs in the development of Himachal Pradesh.

SCOPE OF THE STUDY

The present study has been conducted in three districts of Himachal Pradesh. i.e. Chamba, Kangra and Solan. The present study has undertaken to look into the performance of the NGOs and their relevance in development of the rural areas of state. The main purpose of the study is to discuss the role of the NGOs in rural development of Himachal Pradesh. The present study also provides an in depth background, analysis and interpretation of the performance of the NGOs the different areas of rural development in Himachal Pradesh.

OBJECTIVES OF THE STUDY

The present exercise attempts to attain the following objectives during the course of research.

OBJECTIVES

1. To examine the role and relevance of NGOs in the rural development of Himachal Pradesh.
2. To examine the role of NGOs in creating awareness among rural masses regarding government schemes and programmes for rural development

V. RESEARCH METHODOLOGY

In the present study both primary and secondary sources of data have been used to fulfil the various objectives of the study.

Primary Data

Primary data was collected with the help of questionnaires, discussions, interviews and observation methods.

Questionnaires

A single set of questionnaire was framed to collect data from beneficiaries of NGOs in three district of Himachal Pradesh. While framing the questionnaires an attempt has been made to cover all the aspects related to NGOs.

First of all, preliminary preparation was done for finding out the scope for conducting the present study. Deskwork in various libraries such as Himachal Pradesh University, Indian institute of Himalayan Studies, Himachal Pradesh University, Himachal Pradesh Secretariat, Department of Registrar of Cooperative Society, Shimla and various literatures from office of NGOs was done to review the necessary literature. Various dissertations, Ph.D. Thesis, reports, Newspaper and websites have been consulted to obtain secondary data for the purpose of study. The Ministry of rural development, The Ministry of Social Justice and Empowerment, Department of Planning

 DOI : 10.35291/2454-9150.2019.0282 © 2019, IJREAM All Rights Reserved.

Commission, Family Welfare were also visited to collect information on the present study.

A sample of 450 beneficiaries from the selected volunteer organizations was selected through proportionate random sampling procedure. The respondents from different categories of caste, age group, sex, education level, family background, status and size of income were selected. Further based on discussion with the implementing officials and authorities of NGOs, the major programmes three NGOs were listed for research work and the programmes of these NGOs in Rural Development were identified.

TOOLS USED FOR ANALYSIS AND INTERPRETATION OF DATA

In the analysis of the collected data the Statistical package for social sciences (SPSS, Version 20) was used. Keeping in view of the study, the data collected was coded, scored, and tabulated, analysed and research report was prepared on that basis. The following tools were used in the analysis of the data.

I) Mathematical Tools

II) Statistical tools

The following statistical methods have been used in this Work for the analysis of the data.

1. Arithmetic Mean:

The arithmetic mean has been applied to study the opinion of the NGO beneficiaries on close ended questions and 5 - point likert scale for different rural development indicators and also for the questions related to health, education and social welfare etc of the beneficiaries. The arithmetic mean has been calculated by assigning numerical values to the qualitative indicators. These values have been assigned to qualitative responses as per the below details-

- Five for strongly agree
- four for agree,
- three for indifferent,
- two for disagree
- One for strongly disagree.

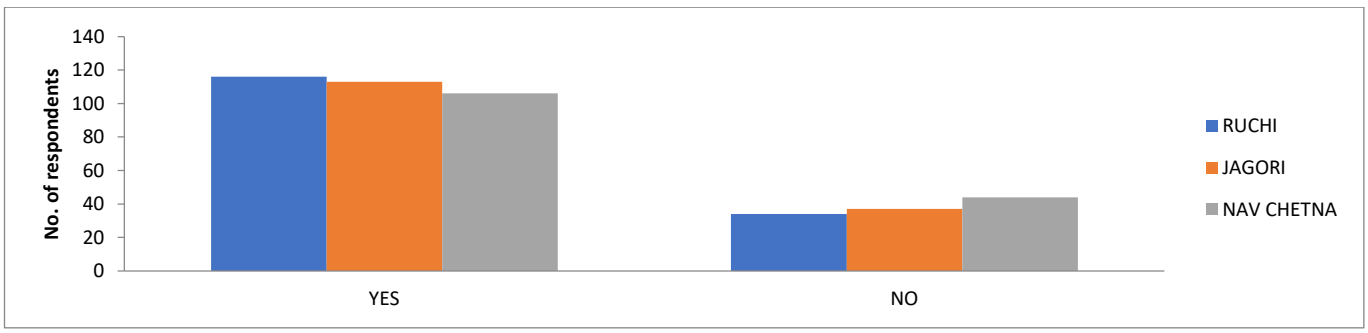
(ii) Co-efiicient of Skewness:

The co-efficient of skewness, as a statistical tool, helps in the study of degree and direction of variation from the central value. It also shows that a particular distribution is symmetrical or positively skewed or negatively skewed.

(iii) Chi-Square Test:

The -^ test as a test of goodness of fit has been used to analyze the magnitude of difference in opinion of the NGO beneficiaries between observed distributions under the assumption that it is equally distributed on the 5- point scale percent or lower level of significance.

VI. ANALYSIS AND INTERPRETATION



1. NGOS AND RURAL DEVELOPMENT

Table 1.1shows the classification of beneficiaries on the basis of their views regarding the role of NGOs in the rural development. It is clear from the table that NGOs are a very important role in the development their area. Further when we asked particularly about the work of selected NGOs in the rural area majority of the people were in the favour of the selected NGOS and their role in the rural development. When asked about the role of NGOS in rural development, 335(74 %) of the beneficiaries responded in the favour of role of NGOs in the rural development whereas 115 (25.6%) of the beneficiaries responded that NGOs are working in the field of social welfare and rural development.

TABLE 1

RESPONSE		RUCHI	JAGORI	NAV CHETNA	TOTAL
	YES	116	113	106	335(74.4)
	NO	34	37	44	115 (25.6)
	TOTAL	**150**	**150**	**150**	**450 (100%)**

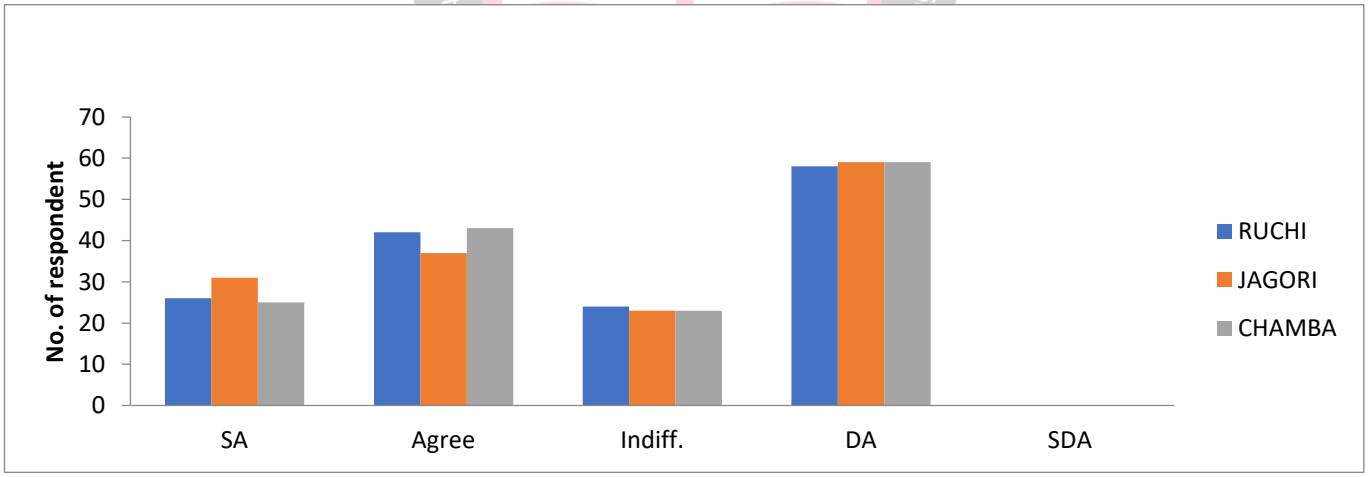
NGOS AND RURAL DEVELOPMENT

Source: data collected through questionnaires

Hence it can be concluded from the above table and discussion that NGOs in the State are playing a very important role in the Rural development and now they have become a wheel of development in rural areas of Himachal Pradesh. Further analysis of some of the important variable was done to develop a vast understanding of role of NGOs in rural Development. Some of the important components of rural development are as follows.

 DOI : 10.35291/2454-9150.2019.0282 © 2019, IJREAM All Rights Reserved.

1.1 Construction of Link Roads



The perception of the beneficiaries of three district NGOs about the role of NGOs in construction of link roads is given in table 1.1. It can be observed from the table that NGOs have made little efforts to provide such help to beneficiaries. It is evident from the table that out of total 450 beneficiaries 176 (39.3%) were disagree, 82 (18.2%) were strongly agree, 122 (27.1%) agree while 70 (15.3%) were indifferent in their views regarding the role of NGOs in the construction of link roads. The mean scores (3.24) of the overall response of the beneficiaries indicates that NGOs play a little role in the construction of link roads in the rural areas as the combined data for agree and strongly agree is 204 whereas the combined data for disagree and indifferent is 246. Hence we cannot fully ignore the role of NGOs in the construction of link roads so we can say NGOs play a little role in the construction f link roads in the rural areas.. The low value of skewness (0.229) also supports this fact that the opinion of beneficiaries is concentrated towards higher side of the overall mean score. The x^ values for goodness of fit are also highly significant. It statistically supports the findings that the majority of beneficiaries of three selected NGOs are agree that NGOs play a moderate role in construction of link roads.

TABLE 1.1 Construction of Link Roads

Name of Organi-zation	SA	Agree	Indiff.	DA	SDA	Total	Mean	Std. Dev.	Skew.	Chi Sq.	PValue
RUCHI	26 (17.3%)	42 (28.0%)	24 (16%)	58 (38.7%)	0	150 (100%)	3.24	1.145	223	84.463	.000
JAGORI	31 (20.7%)	37 (24.7)	23 (15.3)	59 (39.3%)	0	150	3.27	1.185	227	150.00	.000
NAV CHETNA	25 (16.7%)	43 (28.7%)	23 (15.3%	59 (39.3%)	0	150	3.23	1.142	229	107.738	.000
TOTAL	82 (18.2%)	122 (27.1%)	70 (15.3%)	176 (39.3%)	0	450	3.24	1.156	229	337.341	.000

Source: data collected through questionnaires

***Figure 1.1*Construction of Link Roads**

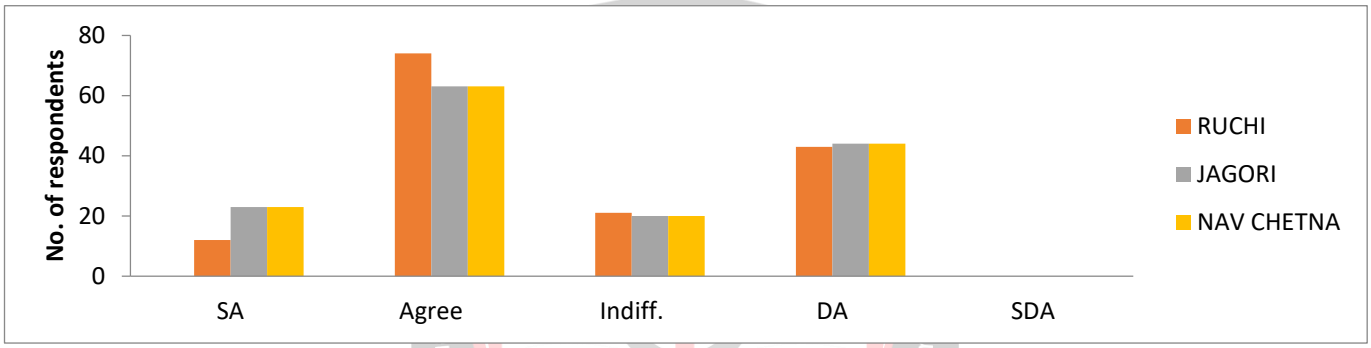
Source: data collected through questionnaires

NGO-wise break-up of the responses of the beneficiaries also show the similar pattern. The moderate role in the construction of link road is played by all the three selected NGOs. The mean score of this NGO is 3.24 and 3.27 respectively and the value of skewness is .223 and .227 respectively. Further the chi square values are highly significant in all NGOs. This also supports statistically the above findings. Thus, it makes clear that mostly the beneficiaries in these NGOs have received moderate help when it comes to construction of link roads.. Thus, it is clear from the statistical analysis that the NGOs have been playing a moderate role in construction of link roads in the rural areas.

1.2. NGOs help in providing Water facilities

The perception of respondents with regard to role of NGOs in providing water facilities to its beneficiaries has been exhibited in table 1.2. The opinions of the beneficiaries' falls between agree and strongly agree. The overall mean score being 3.68

 DOI : 10.35291/2454-9150.2019.0282 © 2019, IJREAM All Rights Reserved.



indicates that majority of beneficiaries agree with this development indicator. The negative value of skewness (-.215) indicating concentration of more opinion towards higher side of mean score. The highly significant chi square value also supports that there is found significant relationship among the responses of the respondents that NGOs help in providing water facilities in the rural areas.

TABLE 1.2 NGOs AND WATER FACILITIES

Name of Organization	SA	Agree	Indiff.	DA	SDA	Total	Mean	Std. Dev.	Skew.	Chi Sq.	P Value
RUCHI	12 (8.0%)	74 (49.3%)	21 (14.0%)	43 (28.7%)	0	150 (100%)	3.37	.986	-.282	84.353	.000
JAGORI	23 (16.7%)	63 (28.7%)	20 (15.3%)	44 (39.3%)	0	150	3.43	1.071	-.173	132.951	.000
NAV CHETNA	23 (16.7%)	63 (28.7%)	20 (15.3%)	44 (39.3%)	0	150	3.43	1.071	-.173	132.951	.000
TOTAL	**51 (18.2%)**	**207 (27.1%)**	**61 (15.3%)**	**131 (39.3%)**	**0**	**450**	**3.68**	**1.024**	**-.215**	**335.964**	**.000**

Source: data collected through questionnaires

Figure 1.2 NGOs AND WATER FACILITIES

Source: data collected through questionnaires

NGO-wise analysis shows that the mean scores of all NGOs fall between agree and strongly agree. It shows that beneficiaries in every NGO find that these NGOs are playing a major role in providing water facilities. The negative value of skewness also indicate that majority of opinion of beneficiaries is concentrated towards the higher side of mean. Thus, majority of beneficiaries in these NGOs agree to this statement. The chi-square test of goodness fit also shows that there is significant relationship among the opinion of the beneficiaries. It is concentrated towards higher side as indicated by value of mean score and negative value of skewness. To sum up, the majority of the beneficiaries in the rural areas of Himachal Pradesh claimed that NGOS play an effective role in providing water facilities in the rural areas. Further during the survey researcher came to know that NGOs are working with IPH department to provide water facilities in the rural areas. NGOs also helping in creating awareness about water purification and use of clean water for drinking purpose in order to avoid all health hazard.

1.3 NGO help in Watershed development

The opinion of respondents with regard to role of NGOs in watershed development to its beneficiaries has been shown in table 1.3. It can be observed from the table that the majority of the beneficiaries in each NGO have responded positively to this indicator. The opinion of the beneficiaries falls between agree and strongly agree. As per the table out of 450 beneficiaries 159(35.33%) are strongly agree, 120 (26.66%) of the respondents are agree whereas 81(18%) were disagree while 66(14.66%) of the beneficiaries were indifferent with the statement. The overall mean score being 3.46 and it indicates that majority of the beneficiaries agreed with this indicator. The negative value of skewness (-3.85) is also supporting the study from the higher side of mean value. The x^ values for the test of goodness of fit in all these NGOs are highly significant. This also supports statistically the above findings. The value of chi square is 159.80 and the table value is 5.991 which is less than the calculated value at 5 percent level of significance and there is found a significant relationship among the responses of the respondents that NGOs help in watershed development in the rural areas of Himachal Pradesh.

Table 1.3 NGOs AND WATERSHED DEVELOPMENT

Name of Organization	SA	Agree	Indiff.	DA	SDA	Total	Mean	Std. Dev.	Skew.	Chi Sq.	P Value
RUCHI	61 (40.66%)	30 (20%)	27 (18%)	32 (21.33%)	0	150 (100%)	3.80	1.187	-,385	97.492	.000
JAGORI	61 (40.66%)	30 (20%)	27 (18%)	32 (21.33%)	0	150	3.80	1.187	-.385	132.951	.000
NAV CHETNA	37	60 (28.7%)	12 (15.3%)	17 (39.3%)	24	150	3.46	1.393	-.671		.000
TOTAL	**159 (35.33%)**	**120 (26.66%)**	**66 (14.66%)**	**81 (18%)**	**24 (5.33%)**	**450 (100%)**	**3.46**	**1.393**	**-.385**	**159.809**	**.000**

Source: data collected through questionnaires

Figure 1.3

Source: data collected through questionnaires

NGO-wise analysis shows that the majority of the beneficiaries in all the three NGOs also indicate similar pattern of responses. The negative value of skewness also indicates that opinion of the beneficiaries is concentrated towards the higher side of mean value. The value of skewness in these NGOS ranges supports that majority of the beneficiaries in each NGO favour the indicator of watershed development. To sum up, the majority of the beneficiaries of Himachal Pradesh claimed that NGOS play an effective role in watershed development in rural areas. Further when researcher visited these areas for survey then we came to know from local people especially in Solan district even at the time of survey, RUCHI in Solan district was running such project.

1.4 NGOs played a role in the improvement in Social status of the rural people.

The perception of respondents with regard to the role of NGOs in improving social status of its beneficiaries has been exhibited in table 1.4. The opinion of the beneficiaries falls between agree and strongly agree. The overall high mean score being 3.85 indicates that majority of beneficiaries agree with this social development indicator. The negative value of skewness (-.527) is also indicating concentration of more opinion towards higher side of mean score. The chi square test of goodness fit also shows significant difference in the district of opinion of beneficiaries which also supports the above findings.

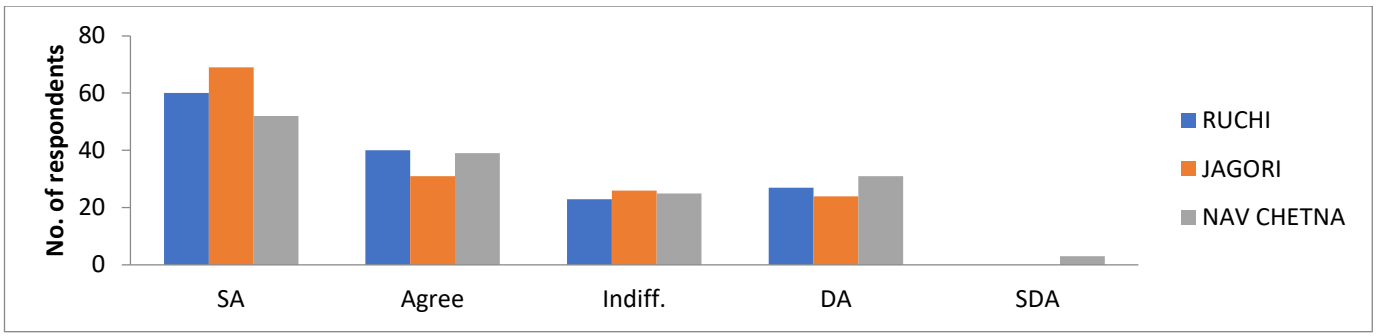

TABLE 1.4 NGOs AND SOCIAL STATUS OF RURAL PEOPLE

Name of Organization	SA	Agree	Indiff.	DA	SDA	Total	Mean	Std. Dev.	Skew.	Chi Sq.	P Value
RUCHI	60 (40%)	40 (26.67%)	23 (15.33%)	27 (18%)	0	150	3.89	1.126	-.545	90.879	.000
JAGORI	69 (46%)	31 (20.67%)	26 (17.33%)	24 (16%)	0	150	3.97	1.132	-.610	134.879	.000

Figure 1.4

Source: data collected through questionnaires

NGO-wise analysis also shows the similar pattern of responses of beneficiaries. The majority of the beneficiaries in all the districts are agree that respective NGOs play a very important role in the upliftment of the social status of the rural masses. The negative value of skewness also indicates that majority of opinion of beneficiaries is concentrated towards the higher side of mean. Through personal observations it came to light that RUCHI and JAGORI in Solan and Kangra district respectively have been most effective in increasing social status of the beneficiaries. These organizations have opened sewing and knitting centres and computer training centres for rural women and children and has trained them in stitching work. Rural women have definitely increased their status as they have started earning on their own. These organisations have also started skill development courses for the rural youth under skill development schemes started by Government of India. This has led to increase in their social status. Hence, the organization has achieved a tremendous success in this field. In contrast to RUCHI and JAGORI, NAV CHETNA has registered far less success but still they are doing well in increasing the social status of the rural masses by helping them in other ways such as women and children issues, creation of Self Help Groups and the like. NAV CHETNA is running skill development courses for educated youth in the rural areas of Chamba district. To sum up, the majority of beneficiaries of Himachal Pradesh claimed that NGOs play an effective role improving their social status.

VII. CONCLUSION

ROLE OF NGOs IN RURAL DEVEOPMENT OF HIMACHAL PRADESH

From the chapter on 'Role of NGOs in Development of Himachal Pradesh', it can be concluded that today the role of NGOs in the field of rural development is wide. It covers not only the rural infrastructure but also covers health, education, social welfare, environment protection etc. The process of growth and development as initiated by NGOs has made a significant improvement in the social, economic, health and educational facilities in rural and remote villages of the three districts of Himachal Pradesh. It has resulted in an increase in the awareness level of beneficiaries in terms of health, hygiene, education and environment. However, these NGOs still lag behind in building physical infrastructures for the beneficiaries.

To be specific the survey shows that most of the beneficiaries are sure about the NGO services in construction of link roads, in providing water facilities, watershed development projects, development of cash crops, development of sericulture units, awareness about irrigation techniques and preservation of natural resources of water and modern technologies in cultivation and harvesting , various government schemes, vocational institutes, mobile schools, adult education, functioning of school committees, maintenance of school libraries, awareness about scholarships, bio-diversity, measurement of air pollution and environment education. Further, the research shows that by and large NGOs have done well in many other fields such as plantation of medicinal plants, formation of village committees, awareness about sanitation, implementation of govt. programmes like NRHM, Swachch Bharat Mission etc, awareness about family planning, organization of health camps, AIDS, adolescent health and Rogi Kalyan Samities, in dealing with disability, a)airvedic home remedies, educational institutes, schools for special children, awareness about right to education more specifically girls education through SSA programmes, forest maintenance and plantation, encouraging entrepreneurship through forest produce, solving sanitation problems and awareness about solid waste management. Moreover, government has been involving NGOs extensively in implementation of various social development projects. This clears the picture that NGOs do have a stake at grass-root level and the strength of NGOs is well recognized by the government.

The roles that the NGOs perform today in rural development of Himachal Pradesh are numerous. They are advocates, educators, catalysts, monitors, whistle blowers, mediators, activists, mobilizers (of both men and resources), protectors of human rights, conscientizes, animators, and conciliators. NGOs are playing a promising interlocutors role in all development activities in existing academic as well as development studies. In recent times, responding to Grass-roots level initiative and voluntary

 DOI : 10.35291/2454-9150.2019.0282 © 2019, IJREAM All Rights Reserved.

action became necessary to develop the rural areas. The increasing demands for the NGOs are itself a response to recent trends relating to socio-economic issues and their corresponding development interventions in academic and policy-oriented research. Today NGOs are playing a dominating role in the implementation of child care, women development, anti-poverty and minimum needs programmes. Further NGOs are also supporting many other economically and social vulnerable groups like small and marginal farmers, agricultural labours, scheduled castes and tribes, bonded labours, rural artisans, rural women, etc., who also need to be brought in the mainstream of development process.

WELCOME TO Pramana Research Journal

The Pramana Research Journal, E-ISSN : 2249-2976 is a monthly publication, with peer arbitration in Engineering, Science and Management. PRJ is an open-access, Multidisciplinary journal, driven by the belief that all types of knowledge must be globally available. Its target audience are original researchers who dialogue with the interdisciplinary theme in science, technology and management. The journal publishes unpublished research, of recognized theoretical rigor, intellectual and scientific relevance and that involves multidisciplinary discussions that revolve around four main thematic axes: Science, Engineering and Management.

Why Publish In PRJ?

High Visibility: Pramana Research Journal of Social, Technological and Environtal Science is available via many university libraries. Articles are freely and easily available to anyone in developing countries. All articles can be accessed for free.

Open Access Option: PRJ is part of online open, which allows authors to access published article anytime and anywhere.

Publication Cost: Very normal charges with additional benefits to publish your articles.

Impact: A good impact views from all over countries like India, Unites states, Europe, Asia, etc...

Impact Factor ()

- PRJ is an Open-Access, peer reviewed International Journal
- We have Provide the prestigious academic journal reviewer's team from various universities, colleges private or government sector, and Highly reputed company.
- It covers the full range of qualitative & effective research papers
- Download any article from the website for free of cost
- Simple steps for publication of research articles and review articles
- Pramana Research Journal of Social, Technological and Environtal Science is Open access journal for high indexing and promotion of your published papers
- Share free Knowledge and promote "Advance Research & Innovative Ideas"
- For any query email us on **submit@pramanaresearch.org,pramanaresearchjournal@gmail.com**

PRJ Submissions Are Invited For

Topics of intrest for submission are included, but are not limited to the following:

- Engineering & Technology
- Arts, Social Sciences And Humanities
- Biomedical Engineering
- Biological & Medical Sciences
- Management And Commerce
- Physical Sciences And Environment

Literary Voice, (ISSN 2277-4521), a Peer-Reviewed, U.G.C. Care Group II and indexed Journal of English Studies, is published regularly with special focus on literature written/being written in English all over the globe. It aims to promote healthy, constructive, critical and interpretative writing on literary issues and trends, and provides a publication platform for the talented young research scholars and emerging new voices in the genres of poetry and fiction globally. Besides Book Reviews, Poems and Interviews, we publish research articles of contributors belonging to different nationalities, on various facets and genres of literature, literary criticism, linguistics and ELT. *LV*, an open access journal, aims to promote high quality empirical and nonempirical interrogations of the extant critical canons that define and enrich credible appreciation of literary texts.

Journal Particulars

Title	*Literary Voice: A Peer Reviewed Journal of English Studies*
Frequency	Biannual
ISSN	2277-4521 (Print)
Publisher	Dr. T. S. Anand
Chief Editor	Dr. T.S. Anand
Copyright	Authors allowed to republish by acknowledging the first source.
Starting Year	2012
Subject	Literature, Literary Criticism, Linguistics.
Language	English
Publication Format	Online
Phone number	9878866667
Email Id	dr_tsanand@yahoo.com
Mobile number	+919878866667
Website	http://www.literaryvoice.in
Address	Dr. T. S. Anand C/o Dr. Sumedha Bhandari, 15-D, Kitchlu Nagar, Ludhiana – 141 001 (India)

Deadline for Submissions

Research Papers/Book Reviews/Poems for March and September editions of LV will be accepted for consideration **only** in the month of December and June respectively. We reserve the right for early closure of submissions before the notified deadlines. Submissions be sent by e-mail at literary.voice@yahoo.com and with the declaration that the submission is original, unpublished, free from plagiarized material and not submitted elsewhere. Submission e-mail must include the statement claiming that you have read the submission guidelines and agree to the policy of the journal. The submissions comprising Quotations in languages other than English, must be accompanied by translation in English within the text in parentheses. For more information about peer review process, publication ethics, copyrights etc., click on About Us.

Peer Review Process

We, in the *Literary Voice* follow a stringent double-blind review of the submitted works in order to conceal the identity of the reviewer and the reviewed. The Reviewer has to convey his approval/disapproval/suggestions for improvement/modification of the submitted article, if any, within three weeks of the

receipt of the article. Subsequently, in case of rejection/or certain concerns raised by the reviewer, the decision will be conveyed to the author and time frame of two weeks will be given for revision and resubmission of the paper for consideration/publication.

Policy Against Plagiarism

Literary Voice has zero tolerance for plagiarism. In case plagiarism is found to have occurred, the Editor reserves the right to ask the author/s to write a formal letter of apology to the author/s of the plagiarized paper, including an admission of plagiarism. In case the paper has appeared on the website, the journal will remove access to it. However, if the paper is under submission, the paper will be automatically rejected by the Editor and the author/s found indulging in plagiarism will be banned permanently.

Guidelines for Authors

The articles/papers must conform to the guidelines enunciated in *MLA Handbook for Writers of Research Papers* (8th Edition). The first page must contain Title or Sub-Title of the Research Paper, with a brief abstract of the paper (150 words appx.) and Keywords, Name of Author(s), Designation, Official Address and E-mail Address. The manuscripts must be in Font: Times New Roman, Size: 12 and justified, Line spacing: single spaced and submitted only in MS Word 2007 or 2010. The size of articles/ papers should be around 3500 words inclusive of Works Cited.

शोध-आलेख सार

सर्जक, सृजन एवं सहृदय भावक-ऐसे तीन प्रमुख बिन्दु हैं जिन्हें केन्द्र में रखकर पठनीयता के परिदृश्य का ईमानदार विश्लेषण किया जा सकता है। इस शोध पत्र में हिन्दी के मध्यकालिक कवि भूषण त्रिपाठी के बहाने उपर्युक्त समस्या को मात्र सर्जक के पक्ष से समझने तथा उसके निराकरण के उपायों की दिशा में आगे बढ़ने का उपक्रम किया गया है।

मुख्य-शब्द : विश्वबोध, सौमनस्य, सृजनधर्मी, महाक्रान्ति, निर्वैयक्तिक ।

साहित्य के महादेश भारतवर्ष का जनजीवन सदैव साहित्य की शक्ति से प्रेरित और प्रभावित रहा है। साहित्य की केन्द्रीय भूमिका के कारण यहाँ के स्वतंत्रचेता कवियों ने समय-समय पर बद्धमूल व्यवस्था में सार्थक हस्तक्षेप कर लोक को नेतृत्व प्रदान किया है। लोक में कवियों की सहज स्वीकार्यता का कारण उनके द्वारा की गई सामाजिकता की साधना है।

किन्तु, बड़े खेद का विषय है कि आज के दौर में- जहाँ विजिगीषु प्रतिगामी शक्तियाँ नागरिक का व्यक्तित्वान्तरण कर उसे उपभोक्ता बनने पर विवश कर रही है, हमारी ऐतिह्य स्मृतियाँ, परम्पराबोध, श्रद्धा-विश्वास और आस्था जैसे मूलाधार बलात् अपदस्थ किए जा रहे हैं- रचनाकार और भावक के बीच सहज सौमनस्य की डोर लगातार तनती जा रही है। हिन्दी तथा कुछेक अन्य भारतीय भाषाओं में घटती पाठकीयता की समस्या को बहुत गहरे महसूस किया जा रहा है।

यह वाकया[1] तब का है जब शाहजहाँ के शासन का अवसान हो चुका था और कवि-कर्म की प्रतिष्ठा का निरन्तर ह्रास हो रहा था। राज्याश्रयी कविगण किसी तरह बड़ी मुश्किल से अपनी वृत्तियाँ वसूल पाते थे। ऐसे में कवि भूषण त्रिपाठी आजीविका के सिलसिले में औरंगजेब के शाही दरबार में पहुँचे। औरंगजेब की खासियत यह थी कि वह अपने पुरखों की तरह विलासप्रिय न था। भले ही मूल्यविहीन राजनीति तथा कपटपूर्ण आचरण के कारण वह कालान्तर में निकृष्ट श्रेणी का शासक सिद्ध हुआ तथापि उसका व्यक्तित्व पराक्रमोन्मुखी था। खैर, समयानुसार कवि भूषण को दरबार में पेश किया गया। भूषण त्रिपाठी वीर रस के सिद्ध कवि थे। औरंगजेब को उनकी वीर-रसीली कविता बेहद पसंद आई। उसने कहा, 'और सुनाओ।' भूषण ने जवाब दिया कि हुजूर का हाथ शृंगार-कविता सुनते-सुनते कुठौर में लगा होगा, इसे धो लें तो कविता सुनाई जाए क्योंकि मेरी वीररस की कविता सुनकर हुजूर का हाथ मूँछों पर चला जाएगा।

औरंगजेब युवा कवि के इस आत्मविश्वास से स्तब्ध रह गया। तनिक सोचकर उसने यह कहते हुए हाथ धो लिए कि यदि मूँछों पर हाथ न गया तो सिर उतरवा लूँगा। फिर क्या, जो होना था सो हुआ। आख़िरकार कविता के प्रभाव में आकर औरंगजेब अनायास ही मूँछों पर ताव देने लगा! कवि और कविता की आन विजयी हुई, भूषण त्रिपाठी दरबार में जम गए।

आज साहित्य का लगभग हर तबका अहर्निश घटती पाठकीयता का राग अलाप रहा है। समकालीन लेखकों के समक्ष, उनकी स्वयं की इयत्ता सिद्ध करने की चुनौतियाँ सिर उठा रही है। उपयोगितावाद के आभोग में हाशिए की ओर खिसकता रचनाकार अपनी अस्मिता के लिए छटपटाता नजर आ रहा है। ऐसी स्थिति के उत्तरदायी सम्भावित कारणों में से एक बड़ा कारण यह हो सकता है कि रचनाकार में 'सिर उतरवाने की चुनौती'

Effects of Temperature Dependent Viscosity and Magnetic Field on the Oscillations in Triply Diffusive Convection

Joginder Singh Dhiman and Praveen K. Sharma*
Department of Mathematics, Himachal Pradesh University, Shimla, India.
**UIT, Himachal Pradesh University, Shimla, India*

Abstract:*The stability of the triply diffusive convective layer of fluid is studied to analyze the effects of temperature dependent viscosity and uniform magnetic field on the growth rate of oscillations. A condition for the stability and consequently for the existence ofoscillatory motions of growing amplitude are derived, using some nontrivial integral estimates obtained from the eigenvalue equations. The upper bounds for the complex growth rate of oscillatory modes are prescribed, which yields that the oscillations can be controlled by an appropriate choice of the parameters of the problem. It is observed that both the temperature dependent viscosity and the magnetic field have the stabilizing effect on the oscillatory instability i.e. both postpone the onset of oscillatory motions in triply diffusive convection. Some consequences of the derived results are also deduced, which are also uniformly valid for the quite general nature of bounding surfaces.*

Keywords: *Triply-diffusive convection; linear stability; Growth rate; Magnetic field; Temperature dependent Viscosity, Oscillatory motions.*

Date of Submission: 29-01-2021 Date of Acceptance: 14-02-2021

I. Introduction

A natural convection flow in a gravity field is termed as Thermohaline convection/ Double-diffusive convection, if both thermal and concentration gradients are affecting the density of the fluid. In the context of the thermohaline instability problem, two fundamental configurations have been studied by Stern [1]/ Veronis [2], wherein the temperature gradient is stabilizing/ destabilizing and the concentration gradient is destabilizing/stabilizing. Gupta *et. al.* [3] studied the stability of Veronis and Stern type's configurations in horizontal layer geometry and derived the sufficient conditions for the stability of an initially top-heavy or an initially bottom-heavy configuration by controlling the growth rate of the oscillatory motions of neutral or growing amplitude. For a broad view of the subject one may be referred to Brandt and Fernando [4].

The influence of magnetic field on an electrically conducting fluid contribute to two kinds of effects: first, by the motion of electrically conducting fluid across the magnetic lines of force, electric currents are generated and the associated magnetic field contribute to change in the existing fields and second, the fluid elements carrying currents transverse magnetic lines of force contributes to additional forces like Lorentz Force acting on the fluid elements. The effect of magnetic field on the stability of thermal convection problem has been thoroughly investigated by Chandrasekhar [5].

Straughan [6] has pointed that the viscosity of a fluid is one of the properties which are most sensitive to temperature. Torrance & Turcotte [7] observed that the viscosity of the liquids decreases with increasing temperature, while the reverse trend is observed in gases. Therefore, the type of fluid and the range of operating temperatures are very crucial parameters in the study of fluid dynamics. Authors have considered the viscosity of the fluid to be constant in most of the studies pertaining to single or double-diffusive convection. Because, additional mathematical complexities arises in convective instability problems, when the viscosity of the fluid is varying with temperature. Some authors, including Stengel *et al.* [8] and Dhiman and Kumar [9] have studied the stability of thermal convection problem by taking into account the variations in viscosity. Dhiman and Kumar [10] studied the thermohaline convection problems under the influence of temperature dependent viscosity and derived some general qualitative and quantitative results for each combination of rigid and dynamically free boundary conditions.

The problem of multi diffusive-convection (when temperature and two or more component agencies, or three different salts are present) becomes more interesting than double-diffusive convection problem. Triple-diffusive convection is of great importance because of its usefulness in describing so many natural phenomena such as acid rain effects, underground water flow, warming of stratosphere etc. Griffiths [11], Pearlstein *et. al.* [12] have studied theoretically the onset of convection in a horizontally fine layer of a triply-diffusive fluid (in which the density depends on three independently diffusing components having different diffusivities) and derived some general results. Many applications of triply-diffusive convection have been discussed by

Pearlstein *et. al.*and they predicted that the onset of convection in triply-diffusive fluid might occur via a quasi-periodic bifurcation from the motionless basic state. For further details in the discipline of multi component diffusion one may be referred to Lopez *et. al.* [13].

This paper is aimed precisely in the direction to include the effects of viscosity variation and magnetic field (acting opposite to the gravity) in triply-diffusive convection problem. Following linear stability theory, a sufficient condition for the stability of oscillatory motions for this general problem is derived, using some integral estimates obtained from the non-dimensional linearized perturbations equations governing the problem and hence the bounds for the complex growth rate for arbitrary neutral or unstable oscillatory modes (when it exist) are prescribed. The obtained results are uniformly valid for all cases of boundary conditions. Some consequences for the triply-diffusive convection problem and double-diffusive convection problems are also worked out.

II. Physical Configuration and Basic Equations

A horizontal layer of viscous incompressible fluid of infinite horizontal extension and finite vertical depth is statically confined between two horizontal boundaries $z = 0$ and $z = d$, which are respectively maintained at uniform temperatures$T_0$and $T_1(< T_0)$ and uniform solute concentrationsS_{a0} , $S_{b0}$and$S_{a1}(< S_{a0})$, $S_{b1}(< S_{b0})$. This layer of fluid is kept under the influence of uniform vertical magnetic field. Let the viscosity of the fluid depend upon temperature. Let the origin be taken on the lower boundary $z = 0$ with z-axis perpendicular to it. It is further assumed that cross diffusion effects are neglected.

Following the usual steps of linear stability theory, the non-dimensional linearized perturbation equations for triply-diffusive convection problem with magnetic field and temperature dependent viscosity can be put in the following form (*c.f.* Gupta *et. al.* [3] and Dhiman and Kumar [10]);

$$f(D^2 - a^2)^2 w - \frac{p}{\sigma}(D^2 - a^2)w + 2(Df)D(D^2 - a^2)w + D^2 f(D^2 + a^2)w$$
$$= R_T a^2 \theta - R_S a^2 \phi_1 - R_S' a^2 \phi_2 - QD(D^2 - a^2)h_z \quad (1)$$
$$(D^2 - a^2 - p)\theta = -w \quad (2)$$
$$\left(D^2 - a^2 - \frac{p}{\tau_1}\right)\phi_1 = -\frac{w}{\tau_1} \quad (3)$$
$$\left(D^2 - a^2 - \frac{p}{\tau_2}\right)\phi_2 = -\frac{w}{\tau_2} \quad (4)$$
$$\left(D^2 - a^2 - \frac{p\sigma_1}{\sigma}\right)h_z = -Dw \quad (5)$$

together with following boundary conditions

$$w = 0 = \theta = \phi_1 = \phi_2 = h_z \ \ at\ z = 0\ and\ z = 1; \quad (6)$$

and the bounding surface is dynamically free or rigid according as $D^2 w = 0\ or\ Dw = 0$ on the lower/upper boundary *i.e.*at $z = 0$and $z = 1$.

In the foregoing equations, $z$is the real independent variable, $D = d/dz$ is the differentiation with respect to z, $a^2$is the square of the wave number, $\sigma$is the thermal Prandtl number, $\sigma_1$is the magnetic Prandtl number,$\tau_1, \tau_2$are the Lewis numbers for the two concentrationsS_a and $S_b$respectively, $R_T$is the thermal Rayleigh number, $R_S$and $R_S'$are the concentration Rayleigh numbers for the two concentration components, Q is the Chandrasekhar number, $p(= p_r + ip_i)$ is the complex growth rate, w, θ, h_z are the perturbations in the vertical velocity, temperature, magnetic field respectively, ϕ_1, $\phi_2$are the perturbations in the respective concentrations of the two components and $\mu[= \mu_0 f(T)]$is the viscosity of the fluid; μ_0 is the viscosity at the lower boundary and $f(T)$ is an arbitrary function of vertical coordinate z.

We have also followed the assumptions of Stengel*et. al.*[8] (regarding the small ratio of the viscosities at the top to the bottom boundaries), in deriving the above equations.

System of equations (1) – (5) together with either of the boundary conditions (6) governing triple diffusive convection problem with temperature dependent viscosity in the presence of magnetic field constitutes an eigen value problem for$R_T$for given values of the other parameters. Further, a given state of system is stable, neutral or unstableaccording as p_r is negative, zero or positive. Further if $p_r = 0$ implies $p_i = 0$ for every wave number$a$ then the *principle of the exchange of stabilities* (PES) is valid, otherwise we shall have *overstability* at least when instability sets in as certain modes.

III. Stability of the oscillatory modes

We shall investigate the character of the oscillatory modes. Let us suppose that$p_i \neq 0$, *i.e*. PES is not valid and instability is through oscillations.

Multiplying equation (1) by w^*(the complex conjugate of w) and integrating the resulting equation by parts a suitable number of times and using the relevant boundary conditions (6) and equations (2)-(5), we have

$$\int_0^1 f(|D^2 w|^2 + 2a^2|Dw|^2 + a^4|w|^2)dz + \frac{p}{\sigma}\int_0^1(|Dw|^2 + a^2|w|^2)dz + \int_0^1(D^2 f)|w|^2 dz$$

$$= R_T a^2 \int_0^1 (|D\theta|^2 + a^2|\theta|^2)dz - R_S a^2 \tau_1 \int_0^1 (|D\phi_1|^2 + a^2|\phi_1|^2)dz$$
$$-R_S' a^2 \tau_2 \int_0^1 (|D\phi_2|^2 + a^2|\phi_2|^2)dz - Q \int_0^1 (|D^2 h_z|^2 + 2a^2|Dh_z|^2 + a^4|h_z|^2)dz$$
$$+a^2 p^* \left[R_T \int_0^1 |\theta|^2 dz - R_S \int_0^1 |\phi_1|^2 dz - R_S' \int_0^1 |\phi_2|^2 dz - \frac{Q\sigma_1}{\sigma} \int_0^1 (|Dh_z|^2 + a^2|h_z|^2)dz\right] \quad (7)$$

Subsequently, for convenience, we will omit the limits of integration from the integral sign and dz from the integrand.Now, equating the real and imaginary parts of both sides of equation (7) and cancelling $p_i (\neq 0)$ throughout from the imaginary part, we have

$$\int f(|D^2 w|^2 + 2a^2|Dw|^2 + a^4|w|^2) + \frac{p_r}{\sigma}\int (|Dw|^2 + a^2|w|^2) + a^2 \int (D^2 f)|w|^2 - R_T a^2 \int (|D\theta|^2 + a^2|\theta|^2)$$
$$-R_S a^2 \tau_1 \int (|D\phi_1|^2 + a^2|\phi_1|^2) - R_S' a^2 \tau_2 \int (|D\phi_2|^2 + a^2|\phi_2|^2) + Q \int (|D^2 h_z|^2 + 2a^2|Dh_z|^2 + a^4|h_z|^2)$$
$$= a^2 p_r \left[R_T \int |\theta|^2 - R_S \int |\phi_1|^2 - R_S' \int |\phi_2|^2 - \frac{Q\sigma_1}{\sigma} \int (|Dh_z|^2 + a^2|h_z|^2)\right] \quad (8)$$

$$\frac{1}{\sigma} \int (|Dw|^2 + a^2|w|^2) + R_T a^2 \int |\theta|^2 - R_S a^2 \int |\phi_1|^2 - R_S' a^2 \int |\phi_2|^2$$
$$- \frac{Q\sigma_1}{\sigma} a^2 \int (|Dh_z|^2 + a^2|h_z|^2) = 0 \quad (9)$$

From equation (9), it follows that

$$R_S a^2 \int |\phi_1|^2 > \frac{1}{\sigma} \int (|Dw|^2 + a^2|w|^2) - R_S' a^2 \int |\phi_2|^2 - \frac{Q\sigma_1}{\sigma} a^2 \int (|Dh_z|^2 + a^2|h_z|^2) \quad (10)$$

Since$w = 0 = \theta = \phi_1 = \phi_2 = h_z \ \ at\ z = 0$ and $z = 1$; therefore, Rayleigh-Ritz inequality [14] yields that

$$\int |D\psi|^2 \geq \pi^2 \int |\psi|^2 \quad (11)$$

where $\psi = \{w, \theta, \ \phi_1, \ \phi_2, \ h_z\}$.

Now, using *Schwartz* inequality, we can have

$$\int |D\theta|^2 = |-\int \theta^* D^2 \theta| \leq \int |\theta^* D^2 \theta| = \int |\theta||D^2 \theta| \leq (\int |\theta|^2)^{\frac{1}{2}} (\int |D^2 \theta|^2)^{\frac{1}{2}} \quad (12)$$

Which upon utilizing inequality (11)$(with\ \psi = \theta)$ gives

$$\int |D^2 \theta|^2 \geq \pi^4 \int |\theta|^2 \quad (13)$$

Now, combining inequality (13)and inequality (11)$(with\ \psi = \theta)$, we have

$$\int (|D^2 \theta|^2 + 2a^2|D\theta|^2 + a^4|\theta|^2) \geq (\pi^2 + a^2)^2 \int |\theta|^2 \quad (14)$$

Proceeding analogously as in the derivation of the inequality (14), we have following inequalities

$$\int f(|D^2 w|^2 + 2a^2|Dw|^2 + a^4|w|^2) \geq f_{min.} (\pi^2 + a^2)^2 \int |w|^2 \quad (15)$$

$$\int (|D^2 h_z|^2 + 2a^2|Dh_z|^2 + a^4|h_z|^2) \geq (\pi^2 + a^2) \int (|Dh_z|^2 + a^2|h_z|^2) \quad (16)$$

Here, $f_{min.}$is the minimum value of $f(z)$ in closed interval$[0, 1]$.

Again, using *Schwartz* inequality, we can have

$$\int (|D\theta|^2 + a^2|\theta|^2) = |-\int \theta^* (D^2 - a^2)\theta| \leq \int |\theta^* (D^2 - a^2)\theta| = \int |\theta||(D^2 - a^2)\theta|$$
$$\leq (\int |\theta|^2)^{\frac{1}{2}} (\int |(D^2 - a^2)\theta|^2)^{\frac{1}{2}} \quad (17)$$

Further, multiplying equation (2) by its complex conjugate and integrating the various terms on left hand side of the resulting equation by parts for an appropriate number of times and making use of boundary condition (6), we obtain

$$\int (|D^2 \theta|^2 + 2a^2|D\theta|^2 + a^4|\theta|^2) + 2p_r \int (|D\theta|^2 + a^2|\theta|^2) + |p|^2 \int |\theta|^2 = \int |w|^2 \quad (18)$$

If permissible, let$p_r \geq 0$. In view of this equation (18) implies that

$$\int |(D^2 - a^2)\theta|^2 = \int (|D^2 \theta|^2 + 2a^2|D\theta|^2 + a^4|\theta|^2) < \int |w|^2 \quad (19)$$

Inequality (17) together with inequalities (14) and (19), yields

$$\int (|D\theta|^2 + a^2|\theta|^2) < \frac{1}{\pi^2 + a^2} \int |w|^2 \quad (20)$$

Now, inequality (10) upon using inequality (11)$(with\ \psi = w)$, yields either of the inequalities

$$R_S a^2 \int |\phi_1|^2 > \frac{\pi^2 + a^2}{\sigma} \int |w|^2 - R_S' a^2 \int |\phi_2|^2 - \frac{Q\sigma_1}{\sigma} a^2 \int (|Dh_z|^2 + a^2|h_z|^2) \quad (21)$$

$$R_S' a^2 \int |\phi_2|^2 > \frac{\pi^2 + a^2}{\sigma} \int |w|^2 - R_S a^2 \int |\phi_1|^2 - \frac{Q\sigma_1}{\sigma} a^2 \int (|Dh_z|^2 + a^2|h_z|^2) \quad (22)$$

$$Q \int (|Dh_z|^2 + a^2|h_z|^2) > \frac{\pi^2 + a^2}{\sigma_1} \int |w|^2 - \frac{R_S a^2 \sigma}{\sigma_1} \int |\phi_1|^2 - \frac{R_S' a^2 \sigma}{\sigma_1} \int |\phi_2|^2 \quad (23)$$

Now, multiplying equation (9) by p_r and adding the resulting equation to equation (8), we have

$$\int f(|D^2 w|^2 + 2a^2|Dw|^2 + a^4|w|^2) + \frac{2p_r}{\sigma} \int (|Dw|^2 + a^2|w|^2) + a^2 \int (D^2 f)|w|^2$$
$$-R_T a^2 \int (|D\theta|^2 + a^2|\theta|^2) - R_S a^2 \tau_1 \int (|D\phi_1|^2 + a^2|\phi_1|^2) - R_S' a^2 \tau_2 \int (|D\phi_2|^2 + a^2|\phi_2|^2)$$
$$-Q \int (|D^2 h_z|^2 + 2a^2|Dh_z|^2 + a^4|h_z|^2) = 0 \quad (24)$$

For $D^2 f \geq 0$ (which is true for the most of the temperature dependent viscosity variation laws), and$p_r \geq 0$, equation (24) yields:

$$\int f(|D^2 w|^2 + 2a^2|Dw|^2 + a^4|w|^2) + R_S a^2 \tau_1 \int (|D\phi_1|^2 + a^2|\phi_1|^2)$$
$$+R_S' a^2 \tau_2 \int (|D\phi_2|^2 + a^2|\phi_2|^2) + Q \int (|D^2 h_z|^2 + 2a^2|Dh_z|^2 + a^4|h_z|^2)$$
$$< R_T a^2 \int (|D\theta|^2 + a^2|\theta|^2) \quad (25)$$

Now, using inequality (11)($with\ \psi = \phi_1\ and \phi_2$), inequalities (15), (16), (20) and using inequalities (21) – (23) successivelyin inequality (25), we haveeither of the following inequalities

$$\frac{(\pi^2+a^2)^3}{a^2\sigma}(\sigma f_{min.} + \tau_1) \int |w|^2 + (\pi^2 + a^2)^2 R_S' a^2 (\tau_2 - \tau_1) \int |\phi_2|^2$$
$$+ \frac{(\pi^2+a^2)^2}{a^2\sigma} Q\sigma_1 \left(\frac{\sigma}{\sigma_1} - \tau_1\right) \int (|Dh_z|^2 + a^2|h_z|^2) < R_T \int |w|^2 \quad (26)$$

$$\frac{(\pi^2+a^2)^3}{a^2\sigma}(\sigma f_{min.} + \tau_2) \int |w|^2 + (\pi^2 + a^2)^2 R_S a^2 (\tau_1 - \tau_2) \int |\phi_1|^2$$
$$+ \frac{(\pi^2+a^2)^2}{a^2\sigma} Q\sigma_1 \left(\frac{\sigma}{\sigma_1} - \tau_2\right) \int (|Dh_z|^2 + a^2|h_z|^2) < R_T \int |w|^2 \quad (27)$$

$$\frac{(\pi^2+a^2)^3}{a^2\sigma}\left(\sigma f_{min.} + \frac{\sigma}{\sigma_1}\right) \int |w|^2 + (\pi^2 + a^2)^2 R_S a^2 \left(\tau_1 - \frac{\sigma}{\sigma_1}\right) \int |\phi_1|^2$$
$$+ (\pi^2 + a^2)^2 R_S' a^2 \left(\tau_2 - \frac{\sigma}{\sigma_1}\right) \int |\phi_2|^2 < R_T \int |w|^2 \quad (28)$$

Taking$\Gamma = min.\{\tau_1\ ,\ \tau_2\ ,\ \sigma/\sigma_1\}$, inequalities (26) - (28) can be written as follows

$$\frac{(\pi^2+a^2)^3}{a^2\sigma}(\sigma f_{min.} + \Gamma) \int |w|^2 < R_T \int |w|^2. \quad (29)$$

Since, minimum value of$(\pi^2 + a^2)^3/a^2$ with respect to $a^2$is $27\pi^4/4$, therefore (29) yields

$$\left[\frac{27\pi^4}{4\sigma}(\sigma f_{min.} + \Gamma) - R_T\right] \int |w|^2 < 0.$$

From the above inequality, it is clear that if$R_T < 27\pi^4(\sigma f_{min.} + \Gamma)/4\sigma$, then we have a contradiction. Hence, we must have $p_r < 0$.

Thus, when $D^2 f \geq 0$and$R_T < 27\pi^4(\sigma f_{min.} + \Gamma)/4\sigma$, $\Gamma = min.\{\tau_1\ ,\ \tau_2\ ,\ \sigma/\sigma_1\}$, the oscillatory modes of the system are stable, *i.e.*the oscillatory modes of growing amplitude are not allowed for triply-diffusiveconvection problem with magnetic field and temperature dependent viscosity.

It is remarkable to note that, when we consider the compliment of the above sufficient condition for the stability of the oscillatory motions, *i.e.* when$R_T \geq 27\pi^4(\sigma f_{min.} + \Gamma)/4\sigma$, the oscillatory modes of growing amplitude may exist. Hence it becomes important to prescribe the bounds for the growth rate of these motions.

IV. Bounds for complex growth rate

In following analysis, we have derived the bounds, which arrest the complex growth rate of the arbitrary neutral or unstable $(p_r \geq 0)$ oscillatory motions $(p_i \neq 0)$for thepresent problem.

We now, prove the following theorem.

Theorem 1. If$(p,\ w, \theta, \phi_1, \phi_2, h_z), p = p_r + ip_i\ , p_i \neq 0, p_r \geq 0,\ D^2 f \geq 0$ is a solution of equations (1)-(5) together with either of boundary conditions (6)and$R_T > 0, R_S > 0, R_S' > 0, R_T > 27\pi^4(\sigma f_{min.} + \Gamma)/4\sigma$, then$|p| < \sigma R_T\sqrt{\Omega^2 - 1}/27\pi^4(\sigma f_{min.} + \Gamma)$,where$\Omega = 4\sigma R_T/27\pi^4(\sigma f_{min.} + \Gamma)$ and$\Gamma = min.\{\tau_1\ , \tau_2\ , \sigma/\sigma_1\}$.

Proof. Taking $p_r \geq 0$ in the equation (18), we have

$$\int (|D^2\theta|^2 + 2a^2|D\theta|^2 + a^4|\theta|^2) + |p|^2 \int |\theta|^2 < \int |w|^2$$

Now, using inequality (14), above inequality yields

$$\int |\theta|^2 < \frac{1}{[(\pi^2+a^2)^2 + |p|^2]} \int |w|^2. \quad (30)$$

Now, using inequalities (19) and (30) in inequality (17), we have

$$\int (|D\theta|^2 + a^2|\theta|^2) < \frac{1}{(\pi^2+a^2)\left[1 + \frac{|p|^2}{(\pi^2+a^2)^2}\right]^{1/2}} \int |w|^2. \quad (31)$$

Now, using inequality (11)($with\ \psi = \phi_1\ and \phi_2$), inequalities (15), (16), (31) and using inequalities (21) – (23) successivelyin inequality (25), we haveeither of the following inequalities

$$\frac{(\pi^2 + a^2)^3}{a^2\sigma}(\sigma f_{min.} + \tau_1) \int |w|^2 + \frac{(\pi^2 + a^2)^2}{a^2\sigma} Q\sigma_1 \left(\frac{\sigma}{\sigma_1} - \tau_1\right) \int (|Dh_z|^2 + a^2|h_z|^2)$$
$$+ (\pi^2 + a^2)^2 R_S' a^2 (\tau_2 - \tau_1) \int |\phi_2|^2 < R_T \left[1 + \frac{|p|^2}{(\pi^2+a^2)^2}\right]^{-1/2} \int |w|^2. \quad (32)$$

$$\frac{(\pi^2 + a^2)^3}{a^2\sigma}(\sigma f_{min.} + \tau_2) \int |w|^2 + \frac{(\pi^2 + a^2)^2}{a^2\sigma} Q\sigma_1 \left(\frac{\sigma}{\sigma_1} - \tau_2\right) \int (|Dh_z|^2 + a^2|h_z|^2)$$

$$+(\pi^2+a^2)^2 R_S a^2(\tau_1-\tau_2)\int|\phi_1|^2 < R_T\left[1+\frac{|p|^2}{(\pi^2+a^2)^2}\right]^{-1/2}\int|w|^2. \quad (33)$$

$$\frac{(\pi^2+a^2)^3}{a^2\sigma}\left(\sigma f_{min.}+\frac{\sigma}{\sigma_1}\right)\int|w|^2+(\pi^2+a^2)^2 R_S a^2\left(\tau_1-\frac{\sigma}{\sigma_1}\right)\int|\phi_1|^2$$

$$+(\pi^2+a^2)^2 R_S' a^2\left(\tau_2-\frac{\sigma}{\sigma_1}\right)\int|\phi_1|^2 < R_T\left[1+\frac{|p|^2}{(\pi^2+a^2)^2}\right]^{-1/2}\int|w|^2. \quad (34)$$

Taking$\Gamma = min.\{\tau_1\ ,\ \tau_2\ ,\ \sigma/\sigma_1\}$, inequalities (32) - (34) can be written as follows

$$\frac{(\pi^2+a^2)^3}{a^2\sigma}(\sigma f_{min.}+\Gamma)\int|w|^2 < R_T\left[1+\frac{|p|^2}{(\pi^2+a^2)^2}\right]^{-1/2}\int|w|^2. \quad (35)$$

Since, minimum value of$(\pi^2+a^2)^3/a^2$ with respect to a^2 is $27\pi^4/4$, therefore (35) yields

$$\left[\frac{27\pi^4}{4\sigma}(\sigma f_{min.}+\Gamma)-R_T\left\{1+\frac{|p|^2}{(\pi^2+a^2)^2}\right\}^{-1/2}\right]\int|w|^2<0. \quad (36)$$

Inequality (36), clearly implies that

$$|p| < (\pi^2+a^2)\sqrt{\Omega^2-1} \quad (37)$$

Where$\Omega = 4\sigma R_T/27\pi^4(\sigma f_{min.}+\Gamma)$.

Also, from inequality (29), we have

$$\frac{(\pi^2+a^2)^3}{a^2\sigma}(\sigma f_{min.}+\Gamma) < R_T. \quad (38)$$

Since, minimum value of$(\pi^2+a^2)^2/a^2$ with respect to a^2 is $4\pi^2$, therefore (38) yields

$$\pi^2+a^2 < \frac{\sigma R_T}{4\pi^2(\sigma f_{min.}+\Gamma)}. \quad (39)$$

Now, using inequality (39) in inequality (37), we get

$|p| < \sigma R_T\sqrt{\Omega^2-1}/4\pi^2(\sigma f_{min.}+\Gamma)$.

Theorem 2. If $(p,\ w,\theta,\phi_1,\phi_2,h_z), p = p_r+ip_i\ , p_i\neq 0, p_r\geq 0,\ D^2 f\geq 0$ is a solution of equations (1)-(5) together with either of boundary conditions (6)-(7) and $R_T>0, R_S>0, R_S'>0, R_T > \frac{27\pi^4\left(f_{min.}+\frac{\tau_1+\tau_2}{\sigma}\right)}{4}$, then$|p| < \frac{\sigma R_T\sqrt{\mathrm{M}^2-1}}{27\pi^4[\sigma f_{min.}+(\tau_1+\tau_2)]}$, where,$\mathrm{M} = 4\sigma R_T/27\pi^4[\sigma f_{min.}+(\tau_1+\tau_2)]$.

Proof. Proceeding as in the derivation of the above Theorem, considering the other forms of inequality (10) derived from equation (9) and making use of these inequalities together with inequality (11)($with\ \psi = \phi 1\ and \phi 2$, inequalities (15), (16), (20), in inequality (25) and following the analogous steps used there in the derivation of the Theorem 1, we can easily prove the theorem.

V. Results and Discussion

In terminology of hydrodynamic stability theory, the above result can be stated as, '*the complex growth rate* $p(=p_r+ip_i)$ *of an arbitrary oscillatory*$(p_i\neq 0)$ *perturbation of growing amplitude* $(p_r\geq 0)$*, in triply-diffusive convection problem with magnetic field and temperature dependent viscosity, when,* $D^2 f\geq 0$ *and*$\Omega > 1$*, lies inside a semicircle in the right half of the* $p_i p_r-$*plane, whose center is at the origin and radius is* $\sigma R_T\sqrt{\Omega^2-1}/27\pi^4(\sigma f_{min.}+\Gamma)$'. From the analysis, we observed that the radius of growth rate of oscillations for an arbitrary oscillatory perturbation decreases under the effects of diffusion ratios (Lewis numbers for the two concentrations), the thermal Prandtl number, the magnetic Prandtl number and the viscosity variation parameter.

The obtained result is uniformly valid for all combinations of rigid and dynamically free boundary conditions.Also, Theorem 1 implies that when $R_T < 27\pi^4(\sigma f_{min.}+\Gamma)/4\sigma$, the oscillatory motions of growing amplitude are not allowed.

Further, from the expression for the growth rate given in Theorem 1, we can see that for Triply-diffusive convection problem with magnetic field and temperature dependent viscosity, one can control the radius of arbitrary oscillatory perturbation by appropriate choice of diffusion ratio's(Lewis numbers for the two concentrations)τ_1 , τ_2,thermal Prandtl number (σ), magnetic Prandtl number(σ_1) and viscosity of the fluid$(f_{min.})$ and hence by modulating the viscosity through temperature, one can control the oscillations of the growth rate.In particular, when the viscosity is a linear, quadratic or exponential function of the temperature, the condition on viscosity *i.e.* $D^2 f\geq 0$is automatically satisfied and$f_{min.}=1$.

From the point of view of hydrodynamic stability theory, following consequences arededuced form Theorem 1.

The complex growth rate $p(=p_r+ip_i)$ of an arbitrary oscillatory$(p_i\neq 0)$ perturbation of growing amplitude$(p_r\geq 0)$lies inside a semicircle in the right half of the $p_i p_r-$plane, whose center is at the origin and radius is as given below, for the following convection problems;

1. For*HydromagneticTriply-diffusive convection problem*with*constant viscosity*$\left(f_{\min.}=1\right)$, the radius is given by $\sigma R_T\sqrt{\mathrm{N}^2-1}/4\pi^2(\sigma+\Gamma)$, where$\mathrm{N}=\frac{4\sigma R_T}{27\pi^4(\sigma+\Gamma)}and\Gamma=min.\{\tau_1\ ,\ \tau_2\ ,\ \sigma/\sigma_1\}$.
2. For*Triply-diffusive convection problem*with *constant viscosity*$(Q=0, f_{min.}=1)$,the radius is given by $\sigma R_T\sqrt{\mathrm{P}^2-1}/4\pi^2(\sigma+\Gamma_1)$, where$\mathrm{P}=4\sigma R_T/27\pi^4(\sigma+\Gamma_1)$ and $\Gamma_1=min.\{\tau_1\ ,\ \tau_2\}$.
3. For*Hydromagnetic Double-diffusive convection* with *temperature dependent viscosity*$(\tau_1=\tau\ ,\tau_2=0)$, the radius is given by $\sigma R_T\sqrt{\mathrm{L}^2-1}/4\pi^2(\sigma f_{min.}+\Gamma_2)$,where$\mathrm{L}=4\sigma R_T/27\pi^4(\sigma f_{min.}+\Gamma_2)and\Gamma_2=min.\{\tau\ ,\ \sigma/\sigma_1\}$.
4. For*Hydromagnetic Double-diffusive convection* with *constant viscosity*$(\tau_1=\tau\ ,\tau_2=0,\ f_{min.}=1)$, the radius is given by $\sigma R_T\sqrt{\mathrm{S}^2-1}/4\pi^2(\sigma+\Gamma_3)$, where $\mathrm{S}=4\sigma R_T/27\pi^4(\sigma+\Gamma_3)$ and $\Gamma_3=min.\{\tau\ ,\ \sigma/\sigma_1\}$.
5. For*Double-diffusive convection* with *temperature dependent viscosity*$(\tau_1=\tau\ ,\tau_2=0,\ Q=0)$, the radius is given by $\sigma R_T\sqrt{\mathrm{X}^2-1}/4\pi^2(\sigma f_{min.}+\tau)$, where$\mathrm{X}=4\sigma R_T/27\pi^4(\sigma f_{min.}+\tau)$.This is the same result as obtained by Dhiman and Kumar [18].
6. For*Double-diffusive convection* with *constant viscosity*$(\tau_1=\tau\ ,\tau_2=0,\ Q=0, f_{min.}=1)$, the radius is given by $\sigma R_T\sqrt{\mathrm{Y}^2-1}/4\pi^2(\sigma+\tau)$, where $\mathrm{Y}=4\sigma R_T/27\pi^4(\sigma+\tau)$.This is the same result as obtained by Gupta *et. al.* [3].

EFFECT OF TEMPERATURE DEPENDENT VISCOSITY ON THERMAL CONVECTION IN FERROFLUID LAYER

JOGINDER SINGH DHIMAN*, NIVEDITA SHARMA

Department of Mathematics, Himachal Pradesh University, Summerhill, Shimla 171005(HP), India

[Received: 18 November 2019. Accepted: 05 October 2020]

ABSTRACT: A linear stability analysis of onset of thermal convection in ferromagnetic fluid layer heated from below with temperature-dependent viscosity is investigated for general bounding surfaces. The eigenvalue problem is solved using a single term Galerkin technique and the values of critical Rayleigh numbers for different combinations of stress free and no-slip boundary conditions are computed for linear and exponential temperature dependent viscosity variations. The effects of temperature dependent viscosity parameter, magnetic Rayleigh number and the magnetization parameter on the onset of stationary convection are investigated numerically. It is found that increase in temperature dependent viscosity and decrease in magnetic number delay the onset of ferroconvection, while the nonlinearity of fluid magnetization has marginal influence on the stability of the system.

KEY WORDS: thermal convection, temperature dependent viscosity, ferrofluids, Galerkin method, Rayleigh number, magnetic Rayleigh number.

1 INTRODUCTION

Due to some physical properties of ferrofluids and its important applications in different fields of industry and medicine, the study of thermal convection in ferrofluids has gained much attention in the recent past. Ferrohydrodynamics, in contrast to the magnetohydrodynamics of ordinary fluids, is of special interest, since the flow here occurs without the imposition of electrical currents and thus in the absence of corresponding *Lorentz* forces. Ferrofluids are very important and useful tool in variety of applications in the fields of technology and biomedical sciences. Rosensweig [1] provided a detailed introduction to the subject of ferrofluids and its properties in his monograph and described the ferrofluids as stable colloidal suspensions consisting of single-domain magnetic particles coated with surfactant and immersed in a carrier fluid. The particles are commonly magnetite and of order 10 nm. in diameter, while the carrier liquid is typically an oil or water base. He observed that magnetization is a function of magnetic field, temperature and density of the fluid in general, and

*Corresponding author e-mail: jsdhiman66@gmail.com

any variation in these properties impart change in the body force distribution in the fluid, which eventually give rise to convection in ferrofluids in the presence of a gradient of magnetic field and the phenomenon is known as ferroconvection, analogous to classical thermal convection (Chandrasekhar [2]).

Finlayson [3] studied the convective instability of a ferromagnetic fluid layer heated from below in the presence of a uniform vertical magnetic field and concluded from the characteristic equation, under the approximation namely; magnetic parameter M_2 very small ($M_2 \approx 0$), that the oscillatory motions of growing amplitude are not allowed and hence the stationary convection is the only mode of instability. Further, he derived an expression for the Rayleigh number for the case of stationary convection from the exact solution of the problem for the case of both free boundaries. He also obtained the numerical values of the critical magnetic Rayleigh number from an approximate solution for the case of both rigid boundaries using Galerkin method. Since then many authors including: Curtis [4], Lalas and Carmi [5], Shliomis [6] and Schwab *et al.* [7] have studied the convective instability in ferrofluids under varying assumptions of ferrohydrodynamics.

One of the well-known phenomena generated by the influence of magnetic field on the ferrofluids is the change of their viscosity. Rosensweig *et al.* [8] in the study of concentrated magnetite ferrofluids revealed that the increasing magnetic field strength increases the viscosity of ferrofluids. Shliomis [6] investigated the effect of a homogeneous magnetic field on the viscosity of a fluid with solid particles possessing intrinsic magnetic moments. The effect of magnetic field dependent (MFD) viscosity on the onset of ferroconvection in a rotating medium has been investigated by Vaidyanathan *et al.* [9]. Nanjundappa *et al.* [10] have also studied the effect of magnetic field dependent (MFD) viscosity on the onset of ferroconvection.

Review of the literature has revealed that for most of the fluids, viscosity is temperature dependent and shows a significant variation with respect to temperature. Torrance and Turcotte [11] found that the viscosity of liquids decreases with increasing temperature, while reverse trend is observed in gases. Early studies related to convection in fluids are by Palm [12] and Stengel *et al.* [13], who respectively considered the *linear* and *exponential* variations of temperature dependent viscosity. Jenkins [14] compared the *linear* and *exponential* viscosity variations with temperature and revealed that the linear dependence is realistic for fluids with small values of viscosity, while exponential dependence is more realistic for fluids with high viscosity. Dhiman and Kumar [15] and Dhiman and Sharma [16, 17] investigated the effect of temperature-dependent viscosity on the Rayleigh-Bénard convection problem in classical fluid, nanofluid and ferrofluid layers, respectively for different cases of boundary conditions.

A critical review of the above studies reveals that the ferrofluid motions have shown strong dependence upon some physical parameters (temperature, magnetic

field and density), therefore, it seems that the temperature-dependent viscosity may be one of the rheological properties that influence the convective motions of the ferrofluids. The present study is motivated by the above point and thus deals with the study of the effect of temperature dependent viscosity on the onset of convection in a ferromagnetic fluid layer in the presence of a uniform vertical magnetic field for different combinations of boundary conditions. The eigenvalue problem is solved using the Galerkin technique for different possible cases of combination of *dynamically free* and *rigid* boundary conditions. The effects of temperature dependent viscosity parameter, magnetic Rayleigh number and the nonlinear fluid magnetization parameter on the onset of stationary convection are discussed.

2 Physical Configuration and Eigenvalue Problem

Let an infinite horizontal layer of ferromagnetic fluid of thickness 'd' is confined between two horizontal boundaries $z = 0$ and $z = d$ in the force field of gravity $\vec{g}(0, 0, -g)$. The lower and upper boundaries are respectively maintained at uniform temperature T_0 and T_1 $(T_0 > T_1)$, thus maintaining a uniform adverse temperature gradient (β) having tendency to increase the density of the fluid in vertical direction z. The fluid is taken to be electrically non-conducting and is also permeated with a uniform vertical magnetic field $\vec{H}(0, 0, H_0)$. Here, it is also assumed that magnetic field $\vec{H}$ and magnetic induction $\vec{B}$ act parallel to each other. The fluid is assumed to be incompressible (Boussinesq) and the viscosity is temperature dependent given by; $\mu = \mu_0 f(T)$.

Following the usual steps of linear stability theory, the non-dimensional linearized perturbation equations and boundary conditions governing the above physical problem are derived in Appendix A; equations (A.22)–(A.26).

System of equations (A.22)–(A.24) and boundary conditions (A.25)–(A.26) constitutes an *eigenvalue problem* for complex growth rate $(p = p_r + ip_i)$ for the given values of other parameters. If $p_r \geq 0$ implies $p_i = 0$ (or *equivalently*, $p_i \neq 0$ implies $p_r < 0$) for all wave number a^2, then for neutral instability $(p_r = 0)$, we have $p = 0$. This situation in hydrodynamic stability theory is termed as *principle of exchange of stabilities* (PES), which means that instability sets in as stationary convection. Proving the validity of PES for any problem results in the elimination of the unsteady terms form the governing equations of the stability problems and thus the transition from stability to instability occurs via a marginal stationary state characterized by $p = 0$. Thus, putting $p = 0$ in governing perturbations, we obtain an eigenvalue problem for Rayleigh number.

The problem of thermal convection in ferrofluids [3] with temperature dependent viscosity was recently studied by Dhiman and Sharma [17] for general cases boundary conditions and proved the validity of the *principle of exchange of stabili-*

ties (PES) using Pellew and Southwell method of conjugate eigenfunctions for this problem governed by equations (A.22)–(A.26), when the magnetic parameter M_2 is very small ($M_2 \approx 0$). This yields that convective instability in ferromagnetic fluids sets in as stationary convection, which also validates the claim of Finlayson [3] regarding the nonexistence of oscillatory motions (for constant viscosity) for the cases of both free and both rigid boundary conditions. Since the typical value of M_2 for magnetic fluids is of the order of 10^{-6}, hence its effect can be neglected as compared to unity in the eigenvalue problem governed by these equations.

In view of the above discussion, the eigenvalue problem for Rayleigh number can be obtained by taking $p = 0$. Hence, equations (A.22)–(A.24) together with the combinations of the *rigid* and *dynamically free* boundary conditions (A.25)–(A.26) for stationary convection with $p = 0$ at $M_2 = 0$, assume the following form:

$$(1) \quad f(D^2 - a^2)^2 w + 2(Df)D(D^2 - a^2)w + D^2 f(D^2 + a^2)w = Ra^2[(1 + M_1)\theta - M_1 D\varphi] \,,$$

$$(2) \quad (D^2 - a^2)\theta = -w \,,$$

$$(3) \quad (D^2 - a^2 M_3)\varphi = D\theta \,,$$

subject to either of the following cases of boundary conditions:

Case 1: *Both boundaries dynamically free*

$$(4) \qquad w = 0 = \theta = D\varphi = D^2 w \quad \text{at} \;\; z = 0 \;\; \text{and} \;\; z = 1 \,.$$

Case 2: *Both boundaries rigid*

$$(5) \qquad w = 0 = \theta = D\varphi = Dw \quad \text{at} \;\; z = 0 \;\; \text{and} \;\; z = 1 \,.$$

Case 3: *One rigid and other free boundary*

$$(6) \qquad \begin{cases} w = 0 = \theta = D\varphi = Dw & \text{at} \;\; z = 0 \;\; (\text{or} \;\; z = 1) \\ w = 0 = \theta = D\varphi = D^2 w & \text{at} \;\; z = 1 \;\; (\text{or} \;\; z = 0) \,. \end{cases}$$

3 Stability Analysis

We shall now use the Galerkin method to solve the above eigenvalue problem. For this, we shall use a single term Galerkin method (*cf.* [3, 15] and [16]) to find the values of Rayleigh numbers for each case of boundary conditions (4)–(6). Let us take a single-term in the expansions of w, θ and φ as

$$(7) \qquad w = Aw_1(z) \,, \quad \theta = B\theta_1(z) \,, \quad \varphi = C\varphi_1(z) \,,$$

where w_1, θ_1 and φ_1 are suitably chosen trial functions which satisfy the respective boundary conditions (4)–(6) and A, B and C are constants.

Substituting the above values of w, θ and φ in equations (1)–(3), multiplying each of the resulting equations (the residuals) by w_1, θ_1 and φ_1, integrating these equations by parts suitable number of times using the relevant boundary conditions (4)–(6), we obtain three homogeneous algebraic equations in A, B and C having its coefficients as definite integrals. For the existence of the nontrivial solution, the determinant of the coefficients must vanish, which yields the following eigenvalue equation involving the relation between Rayleigh number R and wave number a (*the cell size*), as a first order

$$R = \frac{(I_1 + a^2 I_2) I_3}{a^2 I_4 \Big\{ (1 + M_1) I_4 + \dfrac{I_5 (M_1 I_6)}{I_7} \Big\}} \,. \tag{8}$$

Here

$$I_1 = \int_0^1 f \left((D^2 w_1)^2 + 2a^2 (D w_1)^2 + a^4 (w_1)^2 \right) dz \,, \quad I_2 = a^2 \int_0^1 (D^2 f)(w_1)^2 dz \,,$$
$$I_3 = \int_0^1 \left((D\theta_1)^2 + a^2 (\theta_1)^2 \right) dz \,, \quad I_4 = \int_0^1 \theta_1 w_1 dz \,, \quad I_5 = \int_0^1 D\theta_1 \varphi_1 dz \,,$$
$$I_6 = \int_0^1 D\varphi_1 w_1 dz \,, \quad I_7 = \int_0^1 \left((D\varphi_1)^2 + a^2 M_3 (\varphi_1)^2 \right) dz \,.$$

From the above expression (8), we shall compute the minimum of the eigenvalues; *i.e.* the critical Rayleigh number R_c, at which the onset of stationary instability occurs for each case of boundary conditions for both *exponential* and *linear* temperature dependent viscosity variations. For this, we consider following non-dimensional *exponential* and *linear* viscosity variation laws (*cf.* [15] and [16]):

$$f = e^{\delta z} \quad \text{and} \quad f = (1 + \delta z) \,, \tag{9}$$

where $\delta = \gamma \beta d$ is the viscosity variation parameter.

We shall now calculate the values of *critical* Rayleigh numbers for both *exponential* and *linear* variation of viscosity numerically, for each case of boundary conditions, separately.

Case 1: Both boundaries dynamically free. For the present case, let us choose the following suitable polynomial trial functions satisfying the boundary conditions (4)

$$w = z^4 - 2z^3 + z \,, \quad \theta = z(z-1) \quad \text{and} \quad \varphi = \frac{z^2}{2} - \frac{z^3}{3} \,. \tag{10}$$

Using the trial functions (10) and *linear* viscosity variation law (9) in the integrals I_1 to I_7 above, computing each of it numerically and finally using the values in expression (8), we obtain the following Rayleigh number for *linear* viscosity variation:

$$R_{\text{ff}}^{\text{lin}} = \frac{14(42+13a^2M_3)}{867a^2(42+13a^2(1+M_1)M_3)} \times (10+a^2)(31a^4+612a^2+3024)(2+\delta)\,. \tag{11}$$

Similarly using the numerical values of integrals I_1 to I_7 calculated using the *exponential* viscosity law (9) in expression (8), we obtain the following expression for Rayleigh number for the case of *exponential* viscosity variation:

$$\begin{aligned} R_{\text{ff}}^{\text{exp}} = {} & \frac{(42+13a^2M_3)}{a^2(42+13a^2(1+M_1)M_3)}\,\frac{11760}{289\delta^9}\Big[(10+a^2)\Big\{144\delta^4\big(-12-6\delta \\ & -\delta^2+e^{\delta}(12-6\delta+\delta^2)\big)+a^4\big(-20160-1080\delta-1440\delta^2+120\delta^3 \\ & +48\delta^4-\delta^6+e^{\delta}(20160-10080\delta+1440\delta^2+120\delta^3-48\delta^4+\delta^6)\big) \\ & +2a^2\delta^2\big(-15840-7290\delta-1152\delta^2+84\delta^3+36\delta^4-\delta^6 \\ & +e^{\delta}(15840-7290\delta+1152\delta^2+84\delta^3-36\delta^4+\delta^6)\big)\Big\}\Big]\,. \end{aligned} \tag{12}$$

Now, from expression (11) for the case of *linear* viscosity variation, the critical value of the wave number (the *critical cell size*) is determined from the condition, $d(R_{\text{ff}}^{\text{lin}})/da = 0$, which yields the following algebraic equation, whose positive root gives the critical wave number (a_c) depending upon M_1 and M_3:

$$C_1a^{10}+C_2a^8+C_3a^6+C_4a^4+C_5a^2+C_6=0\,. \tag{13}$$

Here

$$\begin{aligned} C_1 &= \left(5239\,(1+M_1)\,M_3^2\right)\,, \\ C_2 &= \left(77909\,(1+M_1)\,M_3^2+(8463M_1+33852)M_3\right)\,, \\ C_3 &= (503412M_3+54684)\,, \\ C_4 &= \left(-2555280\,(1+M_1)\,M_3^2+2496312M_1M_3+813204\right)\,, \\ C_5 &= (-16511040\,(1+M_1)\,M_3)\,, \\ C_6 &= -26671680\,. \end{aligned}$$

Note that equation (13) is a 5th degree algebraic equation in a^2 with coefficients involving M_1 and M_3 implicitly and it is cumbersome to solve analytically equation (13) for any positive root. Hence, in the present investigation, equation (13)

is solved numerically (using *Mathematica*® software) and the values of the critical wave numbers a_c for particular set of values of δ, M_1 and M_3 are obtained and consequently using these values of a_c, the values of *critical* Rayleigh numbers $(R_{ff}^{lin})_c$ are obtained. The results so obtained are also presented in Tables 1 and 2 for the case of *linear viscosity* variation.

Now, for the case of *ordinary fluid*, *i.e.* in the absence of magnetic parameters when $M_1 = 0 = M_3$, equation (13) reduces to the following equation:

$$31a^6 + 461a^4 - 15120 = 0\,, \tag{14}$$

and the only positive root of this equation is given by $a_c = 2.22$.

Thus, the minimum (*critical*) value of Rayleigh number $(R_{\text{ff}}^{\text{lin}})$ given by equation (11), using $a_c = 2.22$, is given by

$$(R_{\text{ff}}^{\text{lin}})_c \approx 332.267(2+\delta) \quad \text{at} \quad a_c = 2.22\,, \tag{15}$$

which is the same value as obtained by Dhiman and Kumar [15] for the thermal convection problem for ordinary fluid (*Newtonian fluid*) with temperature dependent viscosity.

Further, for the case of *constant viscosity* $(\delta \to 0)$, the expression (15) yields

$$R_c = 664.526 \quad \text{at} \quad a_c = 2.22\,, \tag{16}$$

which is about 6.5% higher than the value $R_c = 657.51$ as obtained by Chandrasekhar [2] using full numerical solution, in comparison to the present first approximation solution.

Also, for the case of *constant viscosity*, the expressions (11) and (12) in view the values of the integrals I_1 to I_7, yield the following same expression for Rayleigh number using *exponential* and *linear* variations of viscosity laws:

$$R_{\text{ff}} = \frac{28(10+a^2)(3024+612a^2+31a^4)(42+13M_3a^2)}{867a^2(42+13a^2(1+M_1)M_3)}\,. \tag{17}$$

The minimum value of the R_{ff} given in (17) can be calculated numerically using the critical values of wave number a_c computed from equation (13) for any positive root.

Finlayson [3] in his analysis of ferroconvection (with *constant* viscosity) obtained the following expression for Rayleigh number for the case of both *free boundaries*:

$$R = \frac{(\pi^2+a^2)^3(\pi^2+M_3a^2)}{a^2(\pi^2+a^2(1+M_1)M_3)}\,, \tag{18}$$

and the *critical* value of this Rayleigh number (R) denoted as R_c can computed using critical wave number a_c, which can be obtained from the following equation obtained analogous to equation (13) above:

$$D_1 a^{10} + D_2 a^8 + D_3 a^6 + D_4 a^4 + D_5 a^2 + D_6 = 0\,, \tag{19}$$

where

$$\begin{aligned} D_1 &= 2(1+M_1)M_3^2\,, & D_2 &= ((4+3M_1)\,M_3 + M_1 + 4))M_3\pi^4\,,\\ D_3 &= 2((1+3M_1)\,M_3^2 + 3M_3 + 1)\pi^4\,, & D_4 &= (-(3+M_3)\,M_1 M_3 + 3)\,\pi^6\,,\\ D_5 &= (-2\,(1+M_1)\,M_3)\pi^8\,, & D_6 &= -\pi^{10}\,. \end{aligned}$$

Now, the values of critical wave numbers (a_c^2) computed from expressions (13) and (19) respectively, we obtain the following values of critical Rayleigh numbers $(R_{\rm ff})_c$ and R_c from expressions (17) and (18): $(R_{\rm ff})_c = 342.52$ and $(R)_c = 357.235$, for $a_c^2 = 5.174$ (with $M_1 = 1$ and $M_3 = 10$); $(R_{\rm ff})_c = 65.973$ and $(R)_c = 75.139$, for $a_c^2 = 5.352$ (with $M_1 = 10$ and $M_3 = 6$).

It is clear from the above set of values that the critical Rayleigh numbers computed using (present) *Galerkin first approximation* solution method for the case of *constant viscosity* are in close agreement with the respective values obtained by Finlayson [3] in his analysis for this problem.

Further, using Finlayson [3] analysis, we have following expressions for N (the *magnetic Rayleigh number*) for very large values of M_1, obtained from expressions (11) and (12) respectively for *linear* and *exponential* variations of viscosity

$$(N_{\rm ff}^{\rm lin}) = (R_{\rm ff}^{\rm lin} M_1) = \frac{14(2+\delta)(30240+9144a^2+922a^4+31a^6)(42+13a^2M_3)}{11271a^4M_3} \tag{20}$$

$$\begin{aligned} (N_{\rm ff}^{\rm exp}) = (R_{\rm ff}^{\rm exp} M_1) &= \frac{11760(10+a^2)(42+13a^2M_3)}{3757\delta^9 a^4 M_3}\\ &\times \Big[\Big\{144\delta^4(-12-6\delta-\delta^2+e^\delta(12-6\delta+\delta^2))\\ &+ a^4\big(-20160-10080\delta-1440\delta^2+120\delta^3+48\delta^4-\delta^6\\ &+ e^\delta(20160-10080\delta+1440\delta^2+120\delta^3-48\delta^4+\delta^6)\big)\\ &+ 2a^2\delta^2\big(-15840-7290\delta-1152\delta^2+84\delta^3+36\delta^4-\delta^6\\ &+ e^\delta(15840-7290\delta+1152\delta^2+84\delta^3-36\delta^4+\delta^6)\big)\Big\}\Big]\,, \end{aligned} \tag{21}$$

which represent the magnetic mechanism operating in the absence of buoyancy effects.

Following the above analysis, the numerical values of critical wave numbers a_c at which the minimum (*critical*) values $(N_{\text{ff}}^{\text{exp}})_c$ and $(N_{\text{ff}}^{\text{lin}})_c$ of N_{ff} (for both *exponential* and *linear* cases) exist can be computed analogously. The values so obtained for *linear* case of viscosity variations are presented in Table 3.

Now, proceeding as in Case 1 of boundary conditions above, we can obtain the analogous expressions for Rayleigh numbers for other two cases of boundary conditions (Case 2 and Case 3), also.

Case 2: Both boundaries rigid. The suitable polynomial trial functions satisfying the boundary conditions (5) chosen are

$$w = z^4 - 2z^3 + z^2\,, \quad \theta = z(z-1) \quad \text{and} \quad \varphi = \frac{z^2}{2} - \frac{z^3}{3}\,.$$

Using these trial functions and the viscosity variation laws (9) in expression (8) and proceeding as in Case 1 above, we obtain following expressions for Rayleigh numbers respectively for *linear* and *exponential* variation of viscosity:

$$(R_{\text{rr}}^{\text{lin}}) = \frac{14(2520(4+744\delta)+(744a^2+34a^4+a^6)(2+\delta)(42+13a^2M_3)}{27a^2(42+13a^2(1+M_1)M_3)}\,, \tag{22}$$

$$\begin{aligned}(R_{\text{rr}}^{\text{exp}}) = {} & \frac{7840(10+a^2)[42+13a^2M_3]}{3a^2\delta^9[42+13a^2M_3+13a^2M_1M_3]}\Big[\Big\{6a^4\big(-1680-840\delta \\ & -180\delta^2-20\delta^3-\delta^4+e^{\delta}(1680-840\delta-180\delta^2-20\delta^3-\delta^4)\big) \\ & +\delta^4\big(-864-432\delta-96\delta^2-12\delta^3-\delta^4+e^{\delta}(864-432\delta+96\delta^2 \\ & -12\delta^3+\delta^4)\big)+2a^2\delta^2\big(-7920-3960\delta-852\delta^2-96\delta^3-5\delta^4 \\ & +e^{\delta}(7920-3960\delta+852\delta^2-96\delta^3+5\delta^4)\big)\Big\}\Big].\end{aligned} \tag{23}$$

Case 3: Lower rigid and upper free boundaries. Let us choose following suitable polynomial trial functions satisfying the either of boundary conditions (6)

$$w = 2z^4 - 5z^3 + 3z^2\,, \quad \theta = z(z-1) \quad \text{and} \quad \varphi = \frac{z^2}{2} - \frac{z^3}{3}\,,$$

and proceeding analogously as in other two cases of boundary conditions above, upon using these trial functions and the viscosity variation laws given in (9) in expression (8), we obtain following expressions for Rayleigh numbers for *linear* and *exponential* variation of viscosity, respectively:

$$(R_{\text{rf}}^{\text{lin}}) = \frac{7(42+13a^2M_3)(10+a^2)(1512(12+5\delta)+216a^2(8+5\delta)+a^4(76+43\delta))}{507a^2(42+13a^2(1+M_1)M_3)} \tag{24}$$

$$(R_{\rm rf}^{\rm exp}) = \frac{11760(10+a^2)[42+13a^2M_3]}{169a^2\delta^9[42+13a^2M_3+13a^2M_1M_3]}\Big[\Big\{18\delta^4\big(-384 - 240\delta - 66\delta^2 - 10\delta^3 - \delta^4 - 6e^{\delta}(64-24\delta+3\delta^2)\big) + a^4\big(-36(2240+1400\delta+370\delta^2+50\delta^3+3\delta^4) + e^{\delta}(80640-30240\delta+3240\delta^2+240\delta^3-72\delta^4+\delta^6)\big) + 2a^2\delta^2\big(-18(3520+2200\delta+584\delta^2+80\delta^3+5\delta^4 + e^{\delta}(63360-23760\delta+2592\delta^2+168\delta^3-54\delta^4+\delta^6)\big)\Big\}\Big]. \tag{25}$$

It is to mention here that using the following trial functions, which satisfy the other set of boundary conditions (6); *i.e. upper rigid and lower free boundary*

$$w = 2z^4 - 3z^3 + z\,, \quad \theta = z(z-1) \quad \text{and} \quad \varphi = \frac{z^2}{2} - \frac{z^3}{3}\,,$$

we have obtained the expressions analogous to (24) and (25), which yield almost same numerical values for Rayleigh numbers and hence are omitted here for the sake of compactness.

4 Results and Discussion

In the present analysis, we have investigated the effects of *linear* and *exponential* temperature-dependent viscosity on the onset of thermal convection in ferrofluids. As reported earlier that the *principle of exchange of stabilities* (PES) is valid for the problem with variable viscosity [17], when the values of the magnetic parameter ($M_2 \approx 0$) are very small, which yields that the onset of instability is through stationary modes only. Therefore, the expressions for Rayleigh numbers for stationary convection (for both *linear* and *exponential* cases of viscosity variations) for different cases of boundary conditions are derived using a single-term *Galerkin method* and the values of critical wave numbers and Rayleigh numbers are computed numerically from these eigenvalues.

In Table 1, the values of critical wave numbers a_c^2 computed numerically from expressions (13) for *linear* temperature-dependent viscosity with $\delta = 0.0, 0.2, 0.5, 0.7, 0.9$, $M_1 = 1, 5$ and fixed $M_3 = 10$ are presented, for the case of *both free boundaries.* Using these values of a_c^2 in expression (11), the values of the critical Rayleigh number $(R_{\rm ff})_c$ are computed and are shown in Table 1. Similarly, the values of a_c^2 and Rayleigh numbers; $(R_{\rm rr})_c$ and $(R_{\rm rf})_c$ for both rigid and one rigid one free cases of boundary conditions are computed from expressions (22) and (24) respectively and are also presented in Table 1.

Also, for *linear* viscosity variation, the values of a_c^2 and analogous $(R_{\rm ff})_c$, $(R_{\rm rr})_c$ and $(R_{\rm rf})_c$ which are computed from these expressions for the same set of values δ

with $M_3 = 2$, 6 and fixed $M_1 = 1000$ are presented in Table 2. Further, in Table 3, the values of a_c^2 and analogous $(N_{\text{ff}})_c$, $(N_{\text{rr}})_c$ and $(N_{\text{rf}})_c$ are presented, which are computed from expression (20) and from analogous expressions for the same set of values of parameters. Figs. (1a)–(1f) depict the variations of Rayleigh number and *magnetic* Rayleigh number (R_{ff} and N_{ff}) *versus* the square of the wave number a^2 for

exponential viscosity variations (for the case of *both free boundaries*) with different values of δ and fixed values of M_1 and M_3.

It is found from the values presented in Tables 1–3 for the case of *linear* viscosity variation that the critical wave number (the cell size) is independent of temperature-dependent viscosity δ, but depend upon the *magnetic* parameters M_1 and M_3. It is observed that the values of the critical Rayleigh numbers increase for increasing values of δ for all cases of boundary conditions, which yields that the temperature-dependent viscosity has stabilizing effect on the onset of stationary convection in ferrofluid.

We observed that for increasing values of magnetic number (M_1), the values of critical Rayleigh numbers decrease, which implies that M_1 has destabilizing effect on the onset of stationary convection in ferrofluid layer. This behavior of the system may be due to the increase in the destabilizing magnetic force, as heat is transported more efficiently in magnetic fluids as compared to ordinary fluids. A similar behaviour of Rayleigh numbers plotted in Figs. (1a)–(1b) *versus* a^2 for *exponential* case of viscosity variation with different values of M_1 is also observed.

From Table 2, we observed that the values of Rayleigh numbers decrease with increasing values of M_3 (the measure of *nonlinearity of magnetization*) which yields that M_3 has a destabilizing effect on the onset of stationary convection for all cases of boundary conditions. This may be due to the large *pyromagnetic* coefficient or large *temperature gradient*. However, the destabilizing effect of nonlinearity of the fluid magnetization observed in the present analysis is marginal. Similar effect of M_3 on

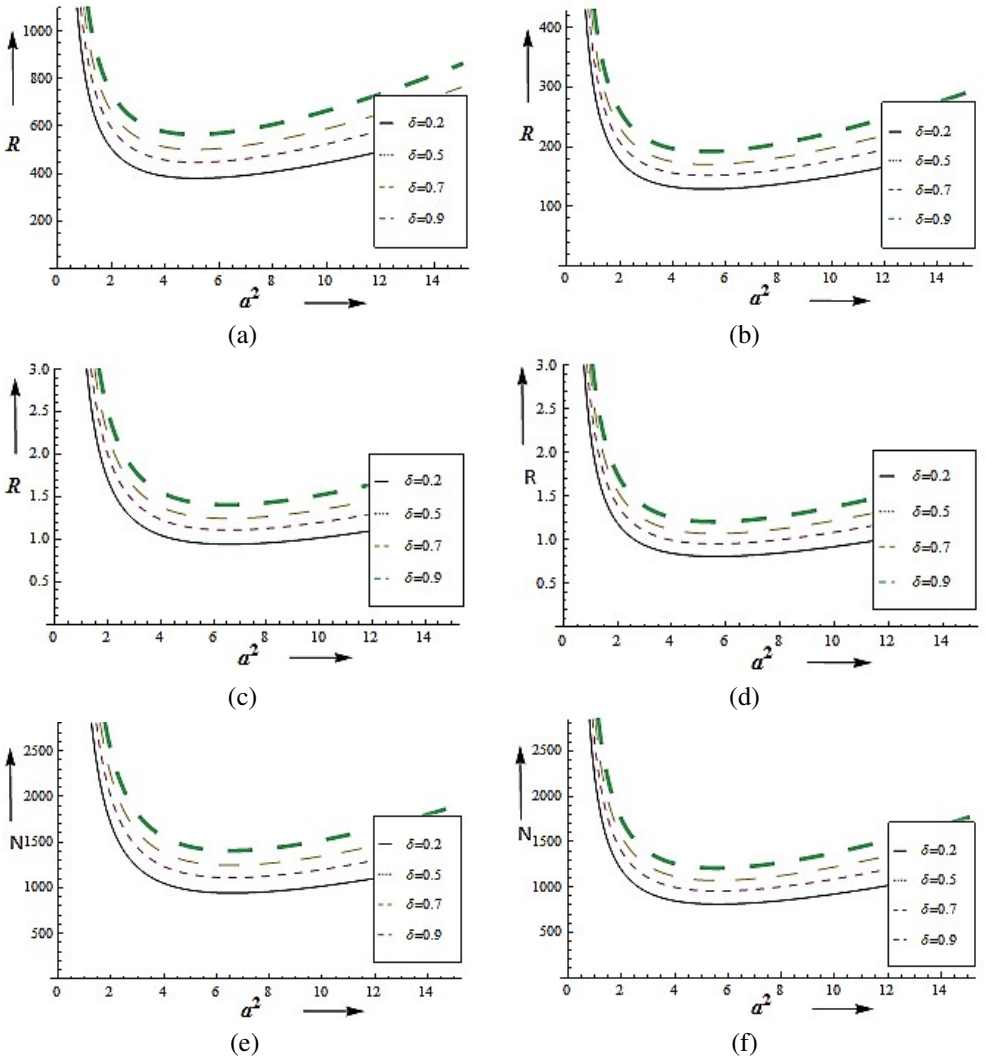

Fig. 1: Plots showing variations of Rayleigh numbers vs. wave number for exponential viscosity variations: Case of both free boundaries: (a) & (b) – variations of R vs. a^2 respectively for $M_1 = 1$ and 5 with fixed $M_3 = 10$; (c) & (d) – variation of R vs. a^2 respectively for $M_3 = 2$ and 6 with fixed $M_1 = 1000$; (e) & (f) – variation of N vs. a^2 respectively for $M_3 = 2$ and 6 with fixed $M_1 = 1000$.

Rayleigh number for *exponential* viscosity variation is also observed from Figs. (1c) & (1d). From Table 3, we observed that the values of critical *magnetic* Rayleigh number also decrease with the increasing values of M_3, for all cases of boundary

conditions. Further, it is evident form Tables 2 and 3 that the values of critical *magnetic* Rayleigh numbers (N_c) are greater than the critical Rayleigh numbers (R_c) yielding that the system is more stable when magnetic mechanism is alone present (in the absence of *buoyancy forces*). From Figs. (1e) & (1f), we observed that the *magnetic* Rayleigh number admits the same behaviour with M_3, for *exponential* case of viscosity variation, also.

In general, it is evident from the computed values that values of critical wave numbers decrease slightly for increasing values of δ for each case of boundary conditions, however the values of critical Rayleigh numbers increase with the increasing δ. We also conclude from the comparison of the numerical values presented here that the *exponential* temperature-dependent viscosity is more stabilizing than the *linear* case of viscosity variation.

From the analysis of the values computed for Rayleigh numbers for *exponential* viscosity variation, we found that it follows analogous trends and variations with respect to the parameters as shown in the case of *linear* viscosity variation in Tables 1–3, hence the tables of values for *exponential* case are omitted here for the sake of compactness. Further, we have observed the same trends of variations of Rayleigh numbers for *linear* and *exponential* cases of viscosity variation, hence the graphs for the *linear* case of viscosity variations and for other two case of boundary conditions for the case of *exponential* viscosity variation are also omitted here.

Appendix A Derivation of Eigenvalue Problem

The basic hydrodynamic equations for thermal convection in ferrofluid in the presence of vertical magnetic field are given in Finlayson [3]. These equations can be rewritten for the case when the viscosity is temperature dependent following Chandrasekhar [2]. Thus, the system of basic equations governing the physical configuration (Section 2) under Boussinesq approximation are given by

$$\nabla \cdot \vec{q} = 0\,, \tag{A.1}$$

$$\rho_0 \frac{D\vec{q}}{Dt} = -\nabla P - \rho g \hat{k} + \frac{\partial}{\partial x_j}\Big[\mu\Big(\frac{\partial u_i}{\partial x_j} + \frac{\partial u_j}{\partial x_i}\Big)\Big] + 2\frac{\partial \mu}{\partial z}\nabla(\vec{q}\cdot\hat{k}) + \nabla\cdot(\vec{H}\vec{B}), \tag{A.2}$$

$$\Big[\rho_0 C_{V,H} - \eta_0 \vec{H}\cdot\big(\frac{\partial \vec{M}}{\partial T}\big)_{V,H}\Big]\frac{DT}{Dt} + \eta_0 T\big(\frac{\partial \vec{M}}{\partial T}\big)_{V,H}\cdot\frac{D\vec{H}}{Dt} = k_1\nabla^2 T\,, \tag{A.3}$$

$$\rho = \rho_0[1-\alpha(T-T_0)]\,. \tag{A.4}$$

The above equations have been casted in a Cartesian coordinate system (x, y, z) with origin at the bottom layer and z-axis is considered vertically upward. In these

equations: $\vec{q} = (u, v, w)$ is the velocity vector, T is the temperature, P is the pressure, g is the gravity, $\hat{k}$ is the unit vector in the z-direction, $\vec{H} = (H_x, H_y, H_z)$ is the magnetic field intensity, $\vec{B} = (B_x, B_y, B_z)$ is the magnetic induction, $\vec{M} = (M_x, M_y, M_z)$ is the magnetization. Also, $\dfrac{D}{Dt} \equiv \left(\dfrac{\partial}{\partial t} + \vec{q}\cdot\nabla\right)$ is the material derivative, $\mu = \mu_0 f(T)$ is the temperature dependent viscosity, $C_{V,H}$ is the specific heat at constant volume and magnetic field, k_1 is the thermal conductivity and α is the coefficient of thermal expansion. Further, ρ_0, η_0 and μ_0 are the density, magnetic permeability and viscosity at the reference temperature T_0.

Equation (A.1) represents the continuity equation, (A.2) is the momentum equation, (A.3) is the energy equation, and (A.4) is the equation of state. Further, the Maxwell's equations for a non-conducting ferromagnetic fluid with no displacement current are given as (Finlayson [3])

$$\nabla \cdot \vec{B} = 0\,, \quad \nabla \times \vec{H} = 0\,, \quad \vec{H} = \nabla \cdot \varphi\,, \tag{A.5}$$

where φ is the magnetic scalar potential. Further, in the Chu formation (see [3]) the magnetic field $\vec{H}$ and magnetization $\vec{M}$ are related to magnetic induction $\vec{B}$ as

$$\vec{B} = \eta_0(\vec{H} + \vec{M})\,. \tag{A.6}$$

First of the equations (A.5), *i.e.* $\nabla \cdot \vec{B} = 0$, upon using equation (A.6), yields

$$\eta_0\big(\nabla \cdot (\vec{H} + \vec{M})\big) = 0\,. \tag{A.7}$$

Since the magnetization is assumed to be aligned with the magnetic field and is a function of temperature and magnetic field, we have

$$\vec{M} = \frac{\vec{H}}{H} M(H, T)\,. \tag{A.8}$$

In addition to the above equations, the magnetic equation of state is given by

$$M = M_0 + \chi(H - H_0) - K_2(T - T_0)\,. \tag{A.9}$$

Here, the magnetic equation is linearized about the magnetic field H_0 and the average temperature T_0. In the above equations; M_0 is the reference magnetization at $H = H_0$ and $T = T_0$, $\chi = \left(\dfrac{\partial M}{\partial H}\right)_{H_0,T_0}$ is the magnetic susceptibility, $K_2 = \left(\dfrac{\partial M}{\partial T}\right)_{H_0,T_0}$ is the pyromagnetic co-efficient and H_0 is the uniform magnetic field of the fluid layer when placed in an *external* magnetic field $\vec{H} = H_0^{\text{ext}}$.

To investigate the instability of equilibrium system, let us add small perturbations to the initial state solution and the perturbed quantities are denoted as

$$\begin{aligned} &\vec{q} = \vec{q}_b(0,0,0) + \vec{V}\,; \quad P = P_b(z) + \delta p\,; \\ &T = T_b(z) + \theta\,; \qquad \rho = \rho_0(1 - \alpha(T_b(z) + \theta - T_0))\,; \\ &\vec{H} = \vec{H}_b(z) + \vec{H}'\,; \qquad \vec{M} = \vec{M}_b(z) + \vec{M}'\,, \end{aligned} \tag{A.10}$$

where $\vec{V}(u,v,w)$, δp, θ, $\vec{H}'$ and $\vec{M}'$ are the respective perturbations in the initial velocity, pressure p temperature T, magnetic field and magnetization and $\vec{q}_b$, $P_b(z)$, $T_b(z)$ and $\vec{H}_b(z)$ are the basic state solutions. Also, $\kappa = \dfrac{k_1}{\rho_0 C_1}$ is the effective thermal diffusivity, $\beta = \dfrac{T - T_0}{d}$ is maintained uniform temperature gradient.

Now following the usual steps of linear stability (Chandrasekhar [2], Finlayson [3]), substituting the perturbed quantities (A.10) in equations (A.1)–(A.3) and (A.7), we obtain the following linearized perturbation equations:

$$\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} + \frac{\partial w}{\partial z} = 0\,, \tag{A.11}$$

$$\begin{aligned} \rho_0 \frac{\partial u}{\partial t} = &-\frac{\partial \delta p}{\partial x} + \mu_0 f(T)\nabla^2 u + \mu_0 \frac{\partial f(T)}{\partial z}\Big(\frac{\partial u}{\partial z} + \frac{\partial w}{\partial x}\Big) \\ &+ \eta_0(H_0 + M_0)\frac{\partial H_1(z)}{\partial z}\,, \end{aligned} \tag{A.12}$$

$$\begin{aligned} \rho_0 \frac{\partial v}{\partial t} = &-\frac{\partial \delta p}{\partial y} + \mu_0 f(T)\nabla^2 v + \mu_0 \frac{\partial f(T)}{\partial z}\Big(\frac{\partial v}{\partial z} + \frac{\partial w}{\partial y}\Big) \\ &+ \eta_0(H_0 + M_0)\frac{\partial H_2(z)}{\partial z}\,, \end{aligned} \tag{A.13}$$

$$\begin{aligned} \rho_0 \frac{\partial w}{\partial t} = &-\frac{\partial \delta p}{\partial z} + \mu_0 f(T)\nabla^2 w + 2\mu_0 \frac{\partial f(T)}{\partial z}\frac{\partial w}{\partial z} + g\alpha\theta\rho_0 \\ &+ \eta_0(H_0 + M_0)\frac{\partial H_3(z)}{\partial z} + \eta_0(M_3 + H_3)\frac{\partial}{\partial z}\Big(H_0 - \frac{K_2\beta z}{1+\chi}\Big)\,, \end{aligned} \tag{A.14}$$

$$\rho_0 C_1 \frac{\partial \theta}{\partial t} - \eta_0 T_0 K_2 \frac{\partial}{\partial t}\Big(\frac{\partial \varphi}{\partial z}\Big) = k_1 \nabla^2 \theta + (\rho_0 C_1 - \frac{\eta_0 T_0 K_2^2}{1+\chi})\beta w\,, \tag{A.15}$$

$$\frac{\partial}{\partial x}(H_1 + M_1) + \frac{\partial}{\partial y}(H_2 + M_2) + \frac{\partial}{\partial z}(H_3 + M_3) = 0\,. \tag{A.16}$$

Here φ is the perturbed magnetic potential and $\rho_0 C_1 = \rho_0 C_{V,H} + K_2 H_0 \eta_0$.

Now, substituting (A.10) in equations (A.8) and (A.9) and taking $K_2\beta d \ll (1+\chi)H_0$, we have

$$H_i + M_i = \begin{cases} (1+M_0/H_0)H_i & \text{for } i=1,2\,, \\ (1+\chi)H_i - K_2\theta & \text{for } i=3\,. \end{cases} \tag{A.17}$$

Upon using equations $\vec{H} = \nabla\cdot\varphi$ and (A.17), equations (A.14) and (A.16) yield

$$\rho_0\frac{\partial w}{\partial t} = -\frac{\partial \delta p}{\partial z} + \mu_0 f(T)\nabla^2 w + 2\mu_0\frac{\partial f(T)}{\partial z}\frac{\partial w}{\partial z} + g\rho_0\alpha\theta + \eta_0(H_0+M_0)\frac{\partial^2\varphi}{\partial z^2} - \eta_0 K_2\beta H_3 + \frac{\eta_0 K_2^2\beta}{1+\chi}\theta\,, \tag{A.18}$$

$$\Big(1+\frac{M_0}{H_0}\Big)\Big(\frac{\partial^2}{\partial x^2}+\frac{\partial^2}{\partial y^2}\Big)\varphi + (1+\chi)\frac{\partial^2\varphi}{\partial z^2} - K_2\frac{\partial\theta}{\partial z} = 0\,. \tag{A.19}$$

Now, eliminating δp amongst the equation (A.11)–(A.13) and (A.18), we have

$$\rho_0\frac{\partial}{\partial t}\nabla^2 w = \rho_0 g\alpha\Big(\frac{\partial^2}{\partial x^2}+\frac{\partial^2}{\partial y^2}\Big)\theta + \mu_0 f(T)\nabla^4 w + 2\mu_0\frac{df(T)}{dz}\nabla^2\Big(\frac{\partial w}{\partial z}\Big) - \mu_0\frac{d^2 f(T)}{dz^2}\Big(\frac{\partial^2}{\partial x^2}+\frac{\partial^2}{\partial y^2}-\frac{d^2}{dz^2}\Big)w - \eta_0 K_2\beta\Big(\frac{\partial^2}{\partial x^2}+\frac{\partial^2}{\partial y^2}\Big)\frac{\partial\varphi}{\partial z} + \frac{\eta_0 K_2^2\beta}{1+\chi}\Big(\frac{\partial^2}{\partial x^2}+\frac{\partial^2}{\partial y^2}\Big)\theta\,. \tag{A.20}$$

Finally, using the *normal mode analysis* by assuming the time dependence periodic solution in horizontal plane of the form

$$(u, v, w, \delta p, \theta) = F^*(z)\exp[i(k_x x + k_y y) + nt] \tag{A.21}$$

we obtain the following system of non-dimensional linearized perturbation equations, after some algebraic manipulations

$$f(T)(D^2-a^2)^2 w - \frac{p}{\sigma}(D^2-a^2)w + 2Df(T)D(D^2-a^2)w + D^2 f(T)(D^2+a^2)w = Ra^2[(1+M_1)\theta - M_1 D\varphi]\,, \tag{A.22}$$

$$(D^2-a^2-p)\theta + pM_2 D\varphi = -(1-M_2)w\,, \tag{A.23}$$

$$(D^2 - a^2 M_3)\varphi = D\theta\,. \tag{A.24}$$

The above equations have been recasted into the non-dimensional forms by using the following non-dimensional quantities:

$$\hat{z} = \frac{z}{d}\,, \quad \hat{a} = kd\,, \quad \hat{D} = d\frac{d}{dz}\,, \quad \hat{p} = \frac{nd^2}{\kappa}\,, \quad \hat{w} = \frac{dw^*}{\nu}\,,$$
$$\hat{\theta} = \frac{\kappa\theta^*}{\beta\nu d}\,, \quad \hat{\varphi} = \frac{(1+\chi)\kappa\varphi^*}{K_2\beta\nu d^2}\,, \quad \sigma = \frac{\nu}{\kappa}\,, \quad \nu = \frac{\mu_0}{\rho_0}\,.$$

In the above equations; $R = \dfrac{g\alpha\beta d^4}{\kappa\nu}$ is Rayleigh number, a is wave number, p is complex *growth rate*, σ is the Prandtl number, $M_1 = \eta_0 K_2^2\beta/\rho_0 g\alpha(1+\chi)$ is the magnetic number, $M_2 = \eta_0 K_2^2 T_0/\rho_0 C_1(1+\chi)$ is the magnetic parameter and $M_3 = \left(1 + \dfrac{M_0}{H_0}\right)/(1+\chi)$ is the measure of nonlinearity of magnetization. Further, the caps have been dropping in the above equations for convenience in writing.

The equations (A.22)–(A.24) must seek solutions subject to certain boundary conditions based upon the nature of the bounding surfaces. The boundary surfaces shall be either rigid (with no slip condition) or dynamically free (where the tangential stresses vanish). Hence, the relevant non-dimensional boundary conditions (for $\chi \to \infty$, *i.e.* for very large magnetic susceptibility) considered here are (*cf.* [3])

(A.25) $\qquad w = 0 = \theta = D\varphi = D^2 w \quad$ on dynamically free surfaces,

(A.26) $\qquad w = 0 = \theta = D\varphi = Dw \quad$ on rigid surfaces.

Abstract

We derive some inequalities involving first four central moments of discrete and continuous distributions. Bounds for the eigenvalues and spread of a matrix are obtained when all its eigenvalues are real. Likewise, we discuss bounds for the roots and span of a polynomial equation.

A NOTE ON VARIANCE BOUNDS AND LOCATION OF EIGENVALUES

R. SHARMA, A. SHARMA AND R. SAINI

(*Communicated by M. Krnić*)

Abstract. We discuss some extensions and refinements of the variance bounds for both real and complex numbers. The related bounds for the eigenvalues and spread of a matrix are also derived here.

1. Introduction

Let $z_1, z_2, \ldots, z_n$ denote n complex numbers. Their arithmetic mean is the number

$$\frac{1}{n}\sum_{i=1}^{n} z_i = \widetilde{z}. \tag{1.1}$$

In literature, the number

$$\frac{1}{n}\sum_{i=1}^{n} |z_i - \widetilde{z}|^2 = S_z^2 \tag{1.2}$$

or its equivalent expressions have been studied in several different contexts and notations and is termed as the variance of complex numbers at many places. For example, see Audenaert [2], Bhatia and Sharma [4,5], Merikoski and Kumar [13], and Park [17].

The number

$$\frac{1}{n}\sum_{i=1}^{n} (z_i - \widetilde{z})^2 = S^2 \tag{1.3}$$

is also important in this context. If z_i's are all real we denote them by x_i's with $a = \min x_i$ and $b = \max x_i$. The arithmetic mean by $\overline{x}$ and variance by the lower case letter s^2. In this case $S_z = |S| = S = s$ but in general S_z rather than $|S|$ is more consistent with s. For instance, $s = 0$ $(S_z = 0)$ if and only if all the x_i's $(z_i$'s$)$ are equal. This is not the case with $|S|$; for example, for three distinct complex numbers 0, $\pm\frac{1}{2} + i\frac{\sqrt{3}}{2}$ we have $S = 0$. It however turns out that for some purposes s^2 is more consistent with

$$\sigma_z^2 = \frac{|S^2| + S_z^2}{2} \tag{1.4}$$

than S_z^2. Note that the analogue of the Popoviciu inequality [18]

$$s^2 \leqslant \frac{(b-a)^2}{4} \tag{1.5}$$

for the complex numbers says that

$$\sigma_z^2 \leqslant \max_{i,j} \frac{\left|z_i - z_j\right|^2}{4}. \tag{1.6}$$

But it is not always true that $S_z^2 \leqslant \max\limits_{i,j} \frac{\left|z_i - z_j\right|^2}{4}$. For example, for $z_1 = -\frac{1}{2} + i\frac{\sqrt{3}}{2}$, $z_2 = 0$ and $z_3 = \frac{1}{2} + i\frac{\sqrt{3}}{2}$, $S_z^2 = \frac{1}{3}$ and $\max\limits_{i,j} \left|z_i - z_j\right| = 1$.

The corresponding inequality for S_z^2 is

$$S_z^2 \leqslant r_z^2 \leqslant \max_{i,j} \frac{\left|z_i - z_j\right|^2}{3}, \tag{1.7}$$

where r_z is the radius of the smallest disk containing all the numbers z_i's, see [4, 5].

A classical theorem of Jung [9] says that the complex numbers z_i's in a plane can be contained in a closed disk of radius $\max\limits_{i,j} \frac{\left|z_i - z_j\right|}{\sqrt{3}}$. We thus have

$$\max_{i,j} \frac{\left|z_i - z_j\right|}{2} \leqslant r_z \leqslant \max_{i,j} \frac{\left|z_i - z_j\right|}{\sqrt{3}}.$$

In this context it is interesting to note a case when the given complex numbers lie on the boundary of the smallest disk containing them. We here show that if the complex numbers lie on a circle with centre at their arithmetic mean then this circle is the smallest circle enclosing these points, (see Theorem 2.1 & 3.1 below). A necessary and sufficient condition is given for which the numbers σ_z, S_z and $|S|$ are all equal, (Theorem 2.2). We obtain a complex analogue of the inequality, Mallows and Richter [11],

$$s^2 \geqslant \frac{r}{n-r} (\alpha_r - \overline{x})^2, \tag{1.8}$$

where α_r is the arithmetic mean of any subset of r numbers chosen from the real numbers $x_1, x_2, \ldots, x_n$, (Theorem 2.3).

On the other hand we find in literature that the inequality (1.5) and its complementary Nagy's inequality [13],

$$s^2 \geqslant \frac{(b-a)^2}{2n} \tag{1.9}$$

also provide bounds for the spread of a complex $n \times n$ matrix A when the eigenvalues $\lambda_i(A)$ of A are all real. The spread of a matrix A is the maximum distance between two eigenvalues of a matrix, $\mathrm{Spd}(A) = \lambda_{\max}(A) - \lambda_{\min}(A)$. We have,

$$\frac{4}{n} \mathrm{tr} B^2 \leqslant \mathrm{Spd}(A)^2 \leqslant 2\mathrm{tr} B^2, \tag{1.10}$$

where $B = A - \frac{\mathrm{tr}A}{n} I$ and $\mathrm{tr}A$ denotes the trace of A, see [6, 23].

We show that the inequalities, [3, 21],

$$\frac{(b-a)^2}{2n} + \frac{2}{n-2}\left(\overline{x} - \frac{a+b}{2}\right)^2 \leqslant s^2 \leqslant (b-\overline{x})(\overline{x}-a), \tag{1.11}$$

provide some further refinements of the inequalities (1.5) and (1.9) and consequently we get better bounds for the spread of a matrix for some special cases, (Theorem 2.4, 2.5, 3.2). A refinement of the inequality (1.5) is obtained for Leptokurtic and Mesokurtic distributions, (Theorem 2.6). It is shown that better estimates can be obtained from the existing bounds for the eigenvalues and spread of a matrix when any one of its eigenvalue is known in advance, (Theorem 3.3, 3.4). Likewise, the bounds for the span of a polynomial are given, (Theorem 3.5).

2. Main results

THEOREM 2.1. *If the complex numbers z_i's in the complex plane lie on a circle with centre $\widetilde{z}$ and radius r_z, then r_z is the radius of the smallest disk containing all the points z_i's.*

Proof. For any complex number c, we can write (1.2) in the form

$$S_z^2 = \frac{1}{n}\sum_{i=1}^{n} |z_i - c + c - \widetilde{z}|^2 = \frac{1}{n}\sum_{i=1}^{n} |z_i - c|^2 - |\widetilde{z} - c|^2. \tag{2.1}$$

If all the complex numbers z_i's lie on the circle $|z-c| = r_z$, then

$$\frac{1}{n}\sum_{i=1}^{n} |z_i - c|^2 = r_z^2. \tag{2.2}$$

Combining (2.1) and (2.2), we get that

$$S_z^2 + |\widetilde{z} - c|^2 = r_z^2. \tag{2.3}$$

From the first inequality (1.7), $r_z \geqslant S_z$. So the minimum value of r_z is S_z. This implies that if $r_z = S_z$ then r_z is the radius of the smallest disk containing the points z_i's. For $\widetilde{z} = c$, (2.3) gives $r_z = S_z$. This proves the theorem. □

THEOREM 2.2. *Let $z_1, z_2, \ldots, z_n$ be the points in the finite complex plane and let S_z, S and σ_z be defined as in (1.2), (1.3) and (1.4), respectively. Then, $S_z = |S| = \sigma_z$ if and only if all the points $z_1, z_2, \ldots, z_n$ lie on a straight line.*

Proof. In the complex plane the convex combination of complex numbers lie in the convex hull of these numbers. It follows that if the points z_i's are collinear then $\widetilde{z}$ also lies on the straight line passing through z_i's.

From (1.2)–(1.4), we see that $S_z = |S| = \sigma_z$ if and only if

$$\left|\sum_{i=1}^{n} (z_i - \widetilde{z})^2\right| = \sum_{i=1}^{n} |z_i - \widetilde{z}|^2 \ . \tag{2.4}$$

The equality occurs in triangle inequality

$$\left|\sum_{i=1}^{n} a_i\right| \leqslant \sum_{i=1}^{n} |a_i|$$

if and only if the ratio of any two non-zero terms is positive that is $\frac{a_i}{a_j} > 0, \quad i,j = 1,2,\ldots,n,$ see Ahlfors [1]. This means (2.4) holds true if and only if the ratio of any two non zero terms in (2.4) is positive, that is

$$\left(\frac{z_i - \widetilde{z}}{z_j - \widetilde{z}}\right)^2 > 0. \tag{2.5}$$

The square of a complex number z is positive if and only if z is real and therefore (2.5) implies that $\frac{z_i-\widetilde{z}}{z_j-\widetilde{z}}$ is real. Also, $\frac{z_i-\widetilde{z}}{z_j-\widetilde{z}}$ is real if and only if z_i lies on the straight line passing through z_j and $\widetilde{z}$. If $z_k - \widetilde{z} = 0$ for some k then $z_k = \widetilde{z}$ and so z_k lies on the straight line passing through z_j and $\widetilde{z}$. □

We need following lemma to extend the inequality (1.8) for complex numbers.

LEMMA 2.1. *Let $Z_1 = \{z_1, z_2, \ldots, z_{n_1}\}$ and $Z_2 = \{z_{n_1+1}, z_{n_1+2}, \ldots, z_{n_1+n_2}\}$ be two sets of complex numbers. Denote by $\widetilde{Z}_i$ and $S^2_{Z_i}$ the arithmetic mean and variance of Z_i's, $i = 1,2$, respectively. Then the combined variance $S^2_{Z_1 \cup Z_2}$ of the set $Z_1 \cup Z_2$ is given by*

$$S^2_{Z_1 \cup Z_2} = \frac{n_1}{n_1+n_2} S^2_{Z_1} + \frac{n_2}{n_1+n_2} S^2_{Z_2} + \frac{n_1 n_2}{(n_1+n_2)^2} \left|\widetilde{Z}_1 - \widetilde{Z}_2\right|^2. \tag{2.6}$$

Proof. The combined variance of the set $Z_1 \cup Z_2$ of $n_1 + n_2$ numbers can be written as

$$S^2_{Z_1 \cup Z_2} = \frac{1}{n_1+n_2} \left(\sum_{j=1}^{n_1} \left|z_j - \widetilde{a}\right|^2 + \sum_{j=n_1+1}^{n_1+n_2} \left|z_j - \widetilde{a}\right|^2 \right), \tag{2.7}$$

where

$$\widetilde{a} = \frac{1}{n_1+n_2} \sum_{j=1}^{n_1+n_2} z_j.$$

We note that

$$\begin{aligned} \left|z_j - \widetilde{a}\right|^2 &= \left|z_j - \widetilde{Z}_1 + \widetilde{Z}_1 - \widetilde{a}\right|^2 \\ &= \left|z_j - \widetilde{Z}_1\right|^2 + \left|\widetilde{Z}_1 - \widetilde{a}\right|^2 + 2\mathrm{Re}\,\overline{\left(\widetilde{Z}_1 - \widetilde{a}\right)} \left(z_j - \widetilde{Z}_1\right), \end{aligned}$$

$$\sum_{j=1}^{n_1} \left(z_j - \widetilde{Z}_1\right) = 0 \text{ and } \left|\widetilde{Z}_1 - \widetilde{a}\right| = \frac{n_2}{n_1+n_2} \left|\widetilde{Z}_1 - \widetilde{Z}_2\right|.$$

Therefore,

$$\sum_{j=1}^{n_1} \left|z_j - \widetilde{a}\right|^2 = \sum_{j=1}^{n_1} \left|z_j - \widetilde{Z}_1\right|^2 + \frac{n_1 n_2^2}{(n_1+n_2)^2} \left|\widetilde{Z}_1 - \widetilde{Z}_2\right|^2. \tag{2.8}$$

On using similar arguments, we have

$$\sum_{j=n_1+1}^{n_1+n_2} \left|z_j-\widetilde{a}\right|^2 = \sum_{j=n_1+1}^{n_1+n_2} \left|z_j-\widetilde{Z}_2\right|^2 + \frac{n_1^2 n_2}{(n_1+n_2)^2}\left|\widetilde{Z}_1-\widetilde{Z}_2\right|^2. \tag{2.9}$$

The assertions of the theorem now follow on using (2.8) and (2.9) in (2.7). □

THEOREM 2.3. *Let γ_r be the arithmetic mean of any subset of r numbers chosen from the set of n complex numbers $z_1, z_2, \ldots, z_n$ and let σ_z^2 be defined as in (1.4). Then the inequality*

$$|\gamma_r - \widetilde{z}|^2 \leqslant \frac{n-r}{r}\sigma_z^2 \tag{2.10}$$

holds true for $1 \leqslant r \leqslant n$.

Proof. Let Z_1 and Z_2 be the disjoint sets of r and $n-r$ numbers chosen from the numbers $z_1, z_2, \ldots, z_n$, respectively. Denote by $S_{z(r)}^2$ and $S_{z(n-r)}^2$ the variance of Z_1 and Z_2, respectively. We now apply Lemma 2.1 and find that

$$S_z^2 = \frac{r}{n}S_{z(r)}^2 + \frac{n-r}{n}S_{z(n-r)}^2 + \frac{r(n-r)}{n^2}|\gamma_r - \gamma_{n-r}|^2 \ . \tag{2.11}$$

Further,

$$|\gamma_r - \gamma_{n-r}| = \left|\gamma_r - \frac{1}{n-r}\left(\sum_{i=1}^{n} z_i - \sum_{i=1}^{r} z_i\right)\right| = \left|\frac{n}{n-r}(\gamma_r - \widetilde{z})\right|$$

and therefore (2.11) can be written as

$$S_z^2 = \frac{r}{n}S_{z(r)}^2 + \frac{n-r}{n}S_{z(n-r)}^2 + \frac{r}{n-r}|\gamma_r - \widetilde{z}|^2 \ . \tag{2.12}$$

On using similar arguments, we have

$$S^2 = \frac{r}{n}S_r^2 + \frac{n-r}{n}S_{n-r}^2 + \frac{r}{n-r}(\gamma_r - \widetilde{z})^2 \ . \tag{2.13}$$

On applying triangle inequality we find from (2.13) that

$$\left|S^2\right| \geqslant \frac{r}{n-r}|\gamma_r - \widetilde{z}|^2 - \left|\frac{r}{n}S_r^2 + \frac{n-r}{n}S_{n-r}^2\right|. \tag{2.14}$$

From (2.12) and (2.14), we get that

$$\left|S^2\right| + S_z^2 \geqslant \frac{2r}{n-r}|\gamma_r - \widetilde{z}|^2 + \frac{r}{n}S_{z(r)}^2 + \frac{n-r}{n}S_{z(n-r)}^2 - \left|\frac{r}{n}S_r^2 + \frac{n-r}{n}S_{n-r}^2\right| \ . \tag{2.15}$$

Again by triangle inequality, $S_{z(r)}^2 \geqslant \left|S_r^2\right|$, $S_{z(n-r)}^2 \geqslant \left|S_{n-r}^2\right|$ and therefore

$$\frac{r}{n}S_{z(r)}^2 + \frac{n-r}{n}S_{z(n-r)}^2 \geqslant \frac{r}{n}\left|S_r^2\right| + \frac{n-r}{n}\left|S_{n-r}^2\right| \geqslant \left|\frac{r}{n}S_r^2 + \frac{n-r}{n}S_{n-r}^2\right|. \tag{2.16}$$

The inequality (2.10) now follows from (2.15) and (2.16). □

The inequality (2.10) is an extension of Mallows and Richter inequality [11]. For $r = 1$, we obtain the generalisation of the well known Samuelson's inequality [20],

$$\sigma_z^2 \geqslant \frac{1}{n-1}\left|z_j - \widetilde{z}\right|^2.$$

Likewise, we can prove the following extension of Nagy's inequality [13],

$$\sigma_z^2 \geqslant \frac{1}{2n}\max_{j,k}\left|z_j - z_k\right|^2, \quad j,k = 1,2,\ldots,n. \tag{2.17}$$

Note that for $r = 1$, $S_1 = 0$ and therefore from (2.13) on using triangle inequality we get that

$$\left|S_{n-1}^2\right| \leqslant \frac{n}{n-1}\left|S^2\right| + \frac{n}{(n-1)^2}\left|\widetilde{z} - z_j\right|^2.$$

Similarly, from (2.12), we have

$$S_{z(n-1)}^2 = \frac{n}{n-1}S_z^2 - \frac{n}{(n-1)^2}\left|\widetilde{z} - z_j\right|^2$$

and by addition we obtain the inequality

$$\sigma_{z(n-1)}^2 = \frac{|S_{n-1}|^2 + S_{z(n-1)}^2}{2} \leqslant \frac{n}{n-1}\sigma_z^2.$$

It then follows inductively that the inequality

$$\sigma_{z(m)}^2 \leqslant \frac{n}{m}\sigma_z^2,$$

holds true for $m = 1,2,\ldots,n$ and therefore for $m = 2$, we have

$$\sigma_z^2 \geqslant \frac{2}{n}\sigma_{z(2)}^2 = \frac{1}{2n}\left|z_i - z_j\right|^2 \tag{2.18}$$

for all $i,j = 1,2,\ldots,n$, $i \neq j$. The inequality (2.18) implies (2.17). Also, see [24].

THEOREM 2.4. *For* $0 \leqslant a < \overline{x} \leqslant s$, *we have*

$$s^2 + \left(\frac{s^2 - \overline{x}^2}{2\overline{x}}\right)^2 \leqslant \frac{(b-a)^2}{4} \tag{2.19}$$

and with $n \geqslant 3$

$$s^2 - \frac{2}{n-2}\left(\frac{s^2 - \overline{x}^2}{2\overline{x}}\right)^2 \geqslant \frac{(b-a)^2}{2n}. \tag{2.20}$$

Proof. The second inequality (1.11) implies that

$$\overline{x}^2 \leqslant (a+b)\overline{x} - ab - s^2,$$

and therefore for $0 \leqslant a < \overline{x}$, we can write

$$\overline{x} \leqslant \frac{a+b}{2} - \frac{s^2 - \overline{x}^2 + ab}{2\overline{x}} \leqslant \frac{a+b}{2} - \frac{s^2 - \overline{x}^2}{2\overline{x}} = \alpha \text{ (say)}. \tag{2.21}$$

It is clear that $\alpha \leqslant \frac{a+b}{2}$ and since $f(x) = (x-a)(b-x)$ increases in the interval $\left[a, \frac{a+b}{2}\right], a < b$, we find that

$$(\overline{x}-a)(b-\overline{x}) \leqslant (\alpha - a)(b-\alpha) = \frac{(b-a)^2}{4} - \left(\frac{s^2-\overline{x}^2}{2\overline{x}}\right)^2. \tag{2.22}$$

Combining (2.22) and the second inequality (1.11); we immediately get (2.19).

Further, it follows from (2.21) that for $0 < \overline{x} \leqslant s$,

$$\left(\frac{a+b}{2} - \overline{x}\right)^2 \geqslant \left(\frac{s^2-\overline{x}^2}{2\overline{x}}\right)^2. \tag{2.23}$$

Combining (2.23) with the first inequality (1.11); a little computation leads to (2.20). □

It may be noted here that the inequality (2.19) can equivalently be written as

$$\frac{m_2'}{\overline{x}} \leqslant b - a, \tag{2.24}$$

where $m_2' = s^2 + \overline{x}^2$.

We mention an alternative proof of (2.24). From the second inequality (1.11),

$$\frac{m_2'}{\overline{x}} \leqslant \frac{(a+b)\overline{x} - ab}{\overline{x}}, \ \overline{x} > 0. \tag{2.25}$$

Also, for $0 \leqslant a < \overline{x} \leqslant s$, from the inequality (1.5), we have $\overline{x} \leqslant s \leqslant \frac{b-a}{2} \leqslant \frac{b}{2}$ and for $\overline{x} \leqslant \frac{b}{2}$,

$$\frac{(a+b)\overline{x} - ab}{\overline{x}} \leqslant b - a. \tag{2.26}$$

The inequality (2.24) follows from (2.25) and (2.26).

THEOREM 2.5. *For $a < 0$ and $\overline{x} \geqslant \sqrt{\frac{n}{2}}s$, we have*

$$s^2 + \left(\frac{\overline{x}^2 - \frac{n}{2}s^2}{2\overline{x}}\right)^2 \leqslant \frac{(b-a)^2}{4} \tag{2.27}$$

and with $n \geqslant 3$,

$$s^2 - \frac{2}{n-2}\left(\frac{\overline{x}^2 - \frac{n}{2}s^2}{2\overline{x}}\right)^2 \geqslant \frac{(b-a)^2}{2n}. \tag{2.28}$$

Proof. We write (1.9) in the form

$$s^2 \geqslant \frac{(b-\overline{x}+\overline{x}-a)^2}{2n} = \frac{(b-\overline{x})^2+(\overline{x}-a)^2+2(b-\overline{x})(\overline{x}-a)}{2n}. \tag{2.29}$$

Using arithmetic mean - geometric mean inequality,

$$(b-\overline{x})^2+(\overline{x}-a)^2 \geqslant 2(b-\overline{x})(\overline{x}-a). \tag{2.30}$$

Thus, from (2.29) and (2.30),

$$s^2 \geqslant \frac{2}{n}(b-\overline{x})(\overline{x}-a). \tag{2.31}$$

It follows from (2.31) that

$$\overline{x}^2 \geqslant (a+b)\overline{x} - \frac{n}{2}s^2 - ab$$

and consequently, for $a<0$ and $\overline{x}>0$, we have

$$\overline{x} \geqslant \frac{a+b}{2} + \frac{1}{2\overline{x}}\left(\overline{x}^2 - \frac{n}{2}s^2 - ab\right) \geqslant \frac{a+b}{2} + \frac{1}{2\overline{x}}\left(\overline{x}^2 - \frac{n}{2}s^2\right) = \beta \text{ (say)}. \tag{2.32}$$

It is clear that $\beta \geqslant \frac{a+b}{2}$ for $\overline{x} \geqslant \sqrt{\frac{n}{2}}s$ and since $f(x)=(\overline{x}-a)(b-\overline{x})$ decreases in the interval $\left[\frac{a+b}{2}, b\right], a<b$, we find that

$$(b-\overline{x})(\overline{x}-a) \leqslant \left(\frac{b-a}{2}\right)^2 - \left(\frac{\overline{x}^2 - \frac{n}{2}s^2}{2\overline{x}}\right)^2. \tag{2.33}$$

Combining (2.33) with the second inequality (1.11); we immediately get (2.27).

From (2.33), we also have

$$\left(\overline{x} - \frac{a+b}{2}\right)^2 \geqslant \left(\frac{\overline{x}^2 - \frac{n}{2}s^2}{2\overline{x}}\right)^2. \tag{2.34}$$

The inequality (2.28) follows from (2.34) and the first inequality (1.11). □

Sharma et al. [22] have proved that

$$m_4 + 3m_2^2 \leqslant (b-a)^2(\overline{x}-a)(b-\overline{x}), \tag{2.35}$$

where $m_2 = s^2$ and $m_4 = \frac{1}{n}\sum_{i=1}^{n}(x_i-\overline{x})^4$.

If the distribution is Leptokurtic or Mesokurtic, we have, see [10],

$$\frac{m_4}{m_2^2} \geqslant 3. \tag{2.36}$$

We prove a refinement of the inequality (1.5) in the following theorem.

THEOREM 2.6. *For a Leptokurtic and Mesokurtic distribution, we have*

$$s^2 \leqslant (b-a)\sqrt{\frac{(\overline{x}-a)(b-\overline{x})}{6}} \leqslant \frac{(b-a)^2}{2\sqrt{6}}. \tag{2.37}$$

Proof. Under the assumptions of the theorem the inequalities (2.35) and (2.36) hold true. By (2.36), $3s^4 \leqslant m_4$ and we obtain from (2.35) that

$$6s^4 \leqslant (b-a)^2(\overline{x}-a)(b-\overline{x}). \tag{2.38}$$

This gives the first inequality (2.37). The second inequality (2.37) follows from (2.38) on using arithmetic mean - geometric mean inequality, $(\overline{x}-a)(b-\overline{x}) \leqslant \frac{(b-a)^2}{4}$. □

We remark that the inequalities (2.37) also hold true for both discrete and continuous distributions.

3. Bounds for eigenvalues

Let $\mathbb{M}(n)$ denote the algebra of all complex $n \times n$ matrices. We assume that the eigenvalues $\lambda_i(A)$ of $A = (a_{ij}) \in \mathbb{M}(n)$ are all real, and may respectively define their arithmetic mean and variance to be

$$\overline{\lambda}(A) = \frac{1}{n}\sum_{i=1}^{n}\lambda_i(A) = \frac{\mathrm{tr}A}{n} \tag{3.1}$$

and

$$s_\lambda^2 = \frac{1}{n}\sum_{i=1}^{n}\left(\lambda_i(A) - \overline{\lambda}(A)\right)^2 = \frac{\mathrm{tr}A^2}{n} - \left(\frac{\mathrm{tr}A}{n}\right)^2 = \frac{\mathrm{tr}B^2}{n}, \tag{3.2}$$

where $B = A - \frac{\mathrm{tr}A}{n}I$.

The spread of a matrix is the greatest distance between its eigenvalues. The notion of the spread was introduced by Mirsky [14, 15] and several authors have studied bounds for the spread of a matrix, see [6, 8, 13, 24].

THEOREM 3.1. *If trace of a unitary matrix $U \in \mathbb{M}(n)$ is zero then the unit circle is the smallest circle enclosing the eigenvalues of U, and greatest lower bound on the $Spd(U)$ is $\sqrt{3}$.*

Proof. The eigenvalues of a unitary matrix U all lie on the unit circle and by assumption of the theorem $\mathrm{tr}U = 0$. So, the eigenvalues $\lambda_i(U)$'s satisfy the conditions of the Theorem 2.1 and hence the unit circle is the smallest circle containing $\lambda_i(U)$'s. It also follows from the second inequality (1.7) that $\mathrm{Spd}(U) \geqslant \sqrt{3}$. □

EXAMPLE 1. The basic circulant matrix C with first row $(0,1,0\ldots,0)$ is a unitary matrix and its trace is zero. By Theorem 3.1 the unit disk is the smallest disk containing eigenvalues of C and $\mathrm{Spd}C \geqslant \sqrt{3}$. Also, for $n = 3$ we have $\mathrm{Spd}C = \sqrt{3}$.

The following theorem is a consequence of Theorem 2.4 and provides refinements of the inequalities (1.10).

THEOREM 3.2. *Let the eigenvalues of an element $A \in \mathbb{M}(n)$ be all non negative and let $0 < \mathrm{tr}A \leqslant \left(n\mathrm{tr}B^2\right)^{\frac{1}{2}}$. Then*

$$\mathrm{Spd}(A) \geqslant \frac{\mathrm{tr}A^2}{\mathrm{tr}A} \tag{3.3}$$

and with $n \geqslant 3$,

$$\mathrm{Spd}(A) \leqslant \frac{1}{\mathrm{tr}A}\left(2\mathrm{tr}B^2(\mathrm{tr}A)^2 - \frac{\left(n\mathrm{tr}B^2 - (\mathrm{tr}A)^2\right)^2}{n(n-2)}\right)^{\frac{1}{2}}. \tag{3.4}$$

Proof. Under the condition $\mathrm{tr}A \leqslant \left(n\mathrm{tr}B^2\right)^{\frac{1}{2}}$, we have

$$\overline{\lambda}(A) = \frac{\mathrm{tr}A}{n} \leqslant \left(\frac{1}{n}\mathrm{tr}B^2\right)^{\frac{1}{2}} = \left(\frac{\mathrm{tr}A^2}{n} - \left(\frac{\mathrm{tr}A}{n}\right)^2\right)^{\frac{1}{2}} = s_\lambda. \tag{3.5}$$

Further, the eigenvalues of A are all non-negative, therefore $0 < \lambda_{\min}(A) \leqslant \overline{\lambda}(A) \leqslant s_\lambda$ and $\mathrm{Spd}(A) = \lambda_{\max}(A) - \lambda_{\min}(A)$. So we can apply Theorem 2.4, the inequalities (3.3) and (3.4) follow on using (3.1) and (3.2) in (2.19) and (2.20), respectively. □

EXAMPLE 2. Let

$$A = \begin{bmatrix} 1 & 1 & 1 & 1 \\ 1 & 4 & 1 & 1 \\ 1 & 1 & 16 & 1 \\ 1 & 1 & 1 & 100 \end{bmatrix}.$$

From (1.10), $81.393 \leqslant \mathrm{Spd}(A) \leqslant 115.11$. The matrix A is positive definite and $\mathrm{tr}A \leqslant \left(n\mathrm{tr}B^2\right)^{\frac{1}{2}}$. So, from our bounds (3.3) and (3.4) we have better estimate $85 \leqslant \mathrm{Spd}(A) \leqslant 104.90$.

Likewise, we can obtain another refinement of the inequality (1.10) on applying Theorem 2.5. If $\lambda_{\min}(A) < 0$ and $0 < 2(\mathrm{tr}A)^2 \geqslant n^2\mathrm{tr}B^2$, then

$$\mathrm{Spd}(A) \geqslant \frac{1}{2n\mathrm{tr}A}\left(16n\mathrm{tr}B^2(\mathrm{tr}A)^2 + \left(2(\mathrm{tr}A)^2 - n^2\mathrm{tr}B^2\right)^2\right)^{\frac{1}{2}} \tag{3.6}$$

and for $n \geqslant 3$,

$$\mathrm{Spd}(A) \leqslant \frac{1}{\mathrm{tr}A}\left(2\mathrm{tr}B^2(\mathrm{tr}A)^2 - \frac{\left(2(\mathrm{tr}A)^2 - n^2\mathrm{tr}B^2\right)^2}{4n(n-2)}\right)^{\frac{1}{2}}. \tag{3.7}$$

Further, Wolkowicz and Styan [23] have shown that if the eigenvalues of $A \in \mathbb{M}(n)$ are all real and $\lambda_1(A) \leqslant \lambda_i(A) \leqslant \lambda_n(A)$, $i = 1, 2, \ldots, n$, then

$$\frac{\mathrm{tr}A}{n} - \sqrt{\frac{n-1}{n}\mathrm{tr}B^2} \leqslant \lambda_1(A) \leqslant \frac{\mathrm{tr}A}{n} - \sqrt{\frac{1}{n(n-1)}\mathrm{tr}B^2} \tag{3.8}$$

and

$$\frac{\mathrm{tr}A}{n}+\sqrt{\frac{1}{n(n-1)}\mathrm{tr}B^2}\leqslant\lambda_n(A)\leqslant\frac{\mathrm{tr}A}{n}+\sqrt{\frac{n-1}{n}\mathrm{tr}B^2}. \tag{3.9}$$

The inequalities (3.8) and (3.9) follow respectively from the inequalities, [7, 20],

$$\overline{x}-\sqrt{n-1}s\leqslant\min_i x_i\leqslant\overline{x}-\frac{s}{\sqrt{n-1}} \tag{3.10}$$

and

$$\overline{x}+\frac{s}{\sqrt{n-1}}\leqslant\max_i x_i\leqslant\overline{x}+\sqrt{n-1}s. \tag{3.11}$$

We now discuss extensions of these inequalities for the case when any one eigenvalue of A is known as in case of stochastic and singular matrices.

It is clear from Lemma 2.1 that if s_{n-1}^2 is the variance of $n-1$ numbers obtained by excluding a number x_j from the real numbers $x_1,x_2,\ldots,x_n$, then

$$s_{n-1}^2=\frac{n}{n-1}s^2-\frac{n}{(n-1)^2}\left(\overline{x}-x_j\right)^2. \tag{3.12}$$

THEOREM 3.3. *Let the eigenvalues of $A\in\mathbb{M}(n)$ be all real. Let $\nu(A)$ be an eigenvalue of A and denote the remaining eigenvalues by $\nu_i(A)$, $\nu_1(A)\leqslant\nu_i(A)\leqslant\nu_{n-1}(A)$, $i=1,2,\ldots,n-1$. Then, for $n\geqslant 3$,*

$$\frac{\mathrm{tr}A-\nu(A)}{n-1}-\sqrt{n-2}s_\nu\leqslant\nu_1(A)\leqslant\frac{\mathrm{tr}A-\nu(A)}{n-1}-\frac{s_\nu}{\sqrt{n-2}} \tag{3.13}$$

and

$$\frac{\mathrm{tr}A-\nu(A)}{n-1}+\frac{s_\nu}{\sqrt{n-2}}\leqslant\nu_n(A)\leqslant\frac{\mathrm{tr}A-\nu(A)}{n-1}+\sqrt{n-2}s_\nu. \tag{3.14}$$

Proof. The arithmetic mean $\overline{\nu}(A)$ of $n-1$ eigenvalues $\nu_i(A)$ can be written as

$$\overline{\nu}(A)=\frac{1}{n-1}\sum_{i=1}^{n-1}\nu_i(A)=\frac{\mathrm{tr}A-\nu(A)}{n-1}. \tag{3.15}$$

By the use of (3.12) the variance of these eigenvalues is

$$\begin{aligned}s_\nu^2&=\frac{1}{n-1}\sum_{i=1}^{n-1}\left(\nu_i(A)-\overline{\nu}(A)\right)^2=\frac{n}{n-1}s_\lambda^2-\frac{n}{(n-1)^2}\left(\overline{\lambda}(A)-\nu(A)\right)^2\\&=\frac{\mathrm{tr}B^2}{n-1}-\frac{n}{(n-1)^2}\left(\frac{\mathrm{tr}A}{n}-\nu(A)\right)^2.\end{aligned} \tag{3.16}$$

On applying (3.10) to $n-1$ numbers $\nu_1(A),\nu_2(A),\ldots,\nu_{n-1}(A)$ and using (3.15) and (3.16); we immediately get (3.13). Likewise, (3.14) follows from (3.11). □

THEOREM 3.4. *Under the conditions of Theorem 3.3., we have*

$$\max_{i,j} \left| \nu_i(A) - \nu_j(A) \right|^2 \leqslant 2 \left(\mathrm{tr}B^2 - \frac{n}{n-1} \left(\frac{\mathrm{tr}A}{n} - \nu(A) \right)^2 \right) \tag{3.17}$$

and

$$\max_{i,j} \left| \nu_i(A) - \nu_j(A) \right|^2 \geqslant \frac{4}{n-1} \left(\mathrm{tr}B^2 - \frac{n}{n-1} \left(\frac{\mathrm{tr}A}{n} - \nu(A) \right)^2 \right). \tag{3.18}$$

Proof. On using the inequalities (1.5) and (1.9), for $n-1$ numbers $\nu_1(A), \nu_2(A), \ldots, \nu_{n-1}(A)$, we have

$$4s_\nu^2 \leqslant \max_{i,j} \left| \nu_i(A) - \nu_j(A) \right|^2 \leqslant 2(n-1)s_\nu^2. \tag{3.19}$$

Inserting (3.16) in (3.19), we immediately get (3.17) and (3.18) on simplifications. □

EXAMPLE 3. Let

$$A = \begin{bmatrix} 1 & 2 & 9 & 4 \\ 2 & 10 & 0 & 4 \\ 9 & 0 & 5 & 2 \\ 4 & 4 & 2 & 6 \end{bmatrix}.$$

From the inequalities (3.8), we have $-9.0688 \leqslant \lambda_1(A) \leqslant .644$. The largest eigenvalue of A is 16 as all its row sums are 16 and A is a symmetric matrix. From (3.13) we have better estimate for the smallest root, $-7.521 \leqslant \lambda_1(A) \leqslant -2.7610$. The actual value of $\lambda_1(A)$ to four decimal places is -6.5788.

We now consider polynomials with real zeros. Let f be a monic polynomial

$$f(x) = x^n + a_1 x^{n-1} + a_2 x^{n-2} + \ldots + a_n \tag{3.20}$$

with only real zeros. Then the length $b-a$ of the smallest interval $[a,b]$ containing all the zeros of f is called span of f, see [12, 19]. Denote by D_n the span of f then

$$\frac{2}{n}\sqrt{(n-1)a_1^2 - 2na_2} \leqslant D_n \leqslant \sqrt{2\frac{n-1}{n}a_1^2 - 4a_2}. \tag{3.21}$$

See Corollary 6.1.4 and Theorem 6.1.6 in [19].

We prove a refinement of (3.21) in the following theorem.

THEOREM 3.5. *Let the zeros of the polynomial (3.20) be all non-negative and let* $2na_2 \leqslant (n-2)a_1^2$. *Then*

$$D_n \geqslant \frac{2a_2 - a_1^2}{a_1} \tag{3.22}$$

and with $n \geqslant 3$,

$$D_n \leqslant \sqrt{\frac{2}{n}\left((n-1)a_1^2 - 2na_2\right) - \frac{1}{n(n-2)}\left(\frac{2na_2 - (n-2)a_1^2}{a_1}\right)^2}. \tag{3.23}$$

Proof. Let $x_1, x_2, \ldots, x_n$ be the roots of the polynomial (3.20). Then, on using relation between roots and coefficient of polynomial, we have

$$\overline{x} = \frac{1}{n}\sum_{i=1}^{n} x_i = \frac{-a_1}{n}$$

and

$$\begin{aligned} s^2 &= \frac{1}{n}\sum_{i=1}^{n} x_i^2 - \overline{x}^2 = \frac{1}{n}\left(\sum_{i=1}^{n} x_i\right)^2 - \frac{2}{n}\sum_{i<j}^{n} x_i x_j - \overline{x}^2 \\ &= \frac{(n-1)a_1^2 - 2na_2}{n^2}. \end{aligned}$$

The assertions of the theorem now follow on applying Theorem 2.4. □

Abstract

The study describes and analyses key bibliometric patterns of 20370 citations appended to 1561 research articles published in Indian Journal of Pure and Applied Mathematics during 1998-2017.A demographic analysis is done to comprehend the chronological growth and authorship pattern ofIndian and foreign contributors associated with different educational and research institutes of the world. Further geographical distribution (nationally and internationally) of contributions along with their pagination is carried out. We have usedtraditional manual data analysis technique to reach at the conclusions.

Abstract: In the present paper, combined effect of magnetic field, porous media and slip flow conditions on the entropy generation in the flow of an incompressible and electrically conducting fluid in an infinite horizontal porous channel under a constant pressure gradient have been carried out. The dimensional ordinary differential equations of motion and energy are transformed to non-dimensional form by using the relevant non-dimensional variables. The exact solutions of governing equations and its numerical calculations have been done by using Matlab function 'bvp4c'. The effect of different governing parameters on velocity, temperature, entropy generation are elaborated with the help of tables and graphs. It is concluded from this study that for increase in the magnetic parameter, slip parameters, group parameter, Brinkmann number, Peclet number and Darcy number, the entropy generation N_s increase near the lower plate whereas the entropy generation decreases with the increase in the Reynold's number.

Keywords: Entropy generation number; Bejan number; Brinkmann number; Peclet number; Reynold's number; Magnetic parameter.

1. Introduction

The second law of thermodynamics analysis is the basis in the area of heat transfer along with thermal design and the structure given by it correlates the hypothesis of entropy generation minimization. The Clasius and Kelvin studied the aspects of irreversibility of the Second law of Thermodynamics and initiated the knowledge of entropy production [1,8,10]. Bejan [2,7] noticed the sources of entropy generation in the process of conventional heat transfer problem. The author entrenched that during the process of flowing of fluid, the production of entropy was ascribed to the finite differences in velocity gradient and the temperature. In fluid dynamics, due to abnormal accord with the results in

the experiment for a century, the studies fail to mention that no slip condition remains a supposition. However, another approach assumed that fluid can slide over a solid surface. Navier [24] presented the slip of fluid at the solid boundary with the help of general boundary conditions. He gave the proposal that at the solid surface, the velocity is proportional to the shear stress. The concept of slip occurrence has been exhibited by many theoretical and experimental studies like Gbadeyan et al. [14], Mahmoud and Waheed [18], Martin and Boyd [21], Mehmood [22]. They examined that rise in the slip parameter slows down the process of flow of fluid. In a channel with permeable boundaries, the effect of slip conditions on hydromagnetic steady flow in a channel with permeable boundaries were given by Khalid and Wafai [17] and Makinde and Osalusi [19] obtained the solution in closed form for steady periodic and transient velocity field with slip conditions. To look into the irreversibilities in terms of the rate of entropy generation, the second law of thermodynamics is applicable. Bejan [9] worked into the second law of thermodynamics by virtue of entropy generation minimization specifically in the area of thermal science, heat transfer, storage and thermal power conversion. The entropy generation minimization studies has procured significant attention in many energy involving problems including thermal energy, cooling of the modern electronic system, geothermal energy system and solar power collectors. In any thermal process, the study of entropy generation gives a useful technique for determining the irreversibility in any thermal process.

The irreversibility occurrence for a microfluidic flow is due to heat and mass transfer, friction dissipation or chemical reaction. Makinde [20] discussed the Entropy analysis for MHD boundary layer flow and heat transfer over a flat plate with a convective surface boundary condition. Akbar [5] investigated the entropy generation and energy conversion rate for the peristaltic flow in a tube with magnetic field. Different aspects of magnetohydrodynamic flow and thermal conductance phenomena have been carried out by various researchers, for details see [4,6]. Jian [16] studied the MHD flow and entropy generation in microchannel with electroosmotic effects. The analysis of the effects of mixed convection and entropy generation on an MHD nanofluid flow is done by Fersadou et al. [13]. Ibanez et al. [15] assessed the impact of magnetic field and entropy generation on nanofluid flow towards a micro-channel. Nasiri et al. [23] investigated the consequences of the magnetic field on entropy generation towards a microchannel. Shi and Dong [26] have reviewed the entropy generation and heat transfer flow through a microchannel.

The primary objective of the present analysis is to examine the combined effects of magnetic field, suction / injection and Navier slips on entropy generation in a MHD flow through a porous channel under a constant pressure gradient. The solutions in closed form have been obtained for the velocity and temperature of the fluid. The various plots have been displayed which have been obtained with the help of Matlab function ‘bvp4c’ of the solution of given boundary value problem. The effect of different parameters involving in the governing equations of the problem on velocity flow, temperature flow, entropy generation and Bejan number have been studied.

2. Mathematical Formulation of the problem

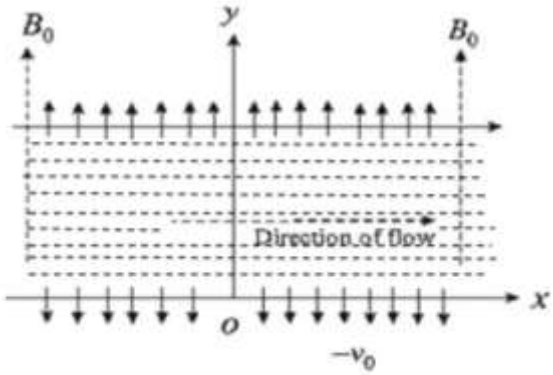

Fig A. Geometrical configuration of the problem

Let us have a viscous incompressible electrically conducting fluid enclosed between two infinite horizontal parallel porous plates at a distance 'h' apart. Let us have x-axis along the lower stationery plate which is also the direction of flow of fluid and y-axis perpendicular to the plates in the cartesian coordinate system. The uniform transverse magnetic field B_0 is in the direction perpendicular to the plates of the channel. Due to the infinite length of the plates, all physical variables excluding pressure are dependant only upon y.

The basic fundamental equations of fluid dynamics then become:

Equation of Continuity:

$v = -v_0$ where $v_0$is the suction velocity at the plates

Equation of Motion:

$$-v_0 \frac{du}{dy} = -\frac{1}{\rho}\frac{\partial \rho}{\partial x} + \upsilon \frac{d^2u}{dy^2} - \sigma \frac{B_0^2}{\rho} u - \frac{\upsilon u}{k} \tag{1}$$

Equation of Energy:

$$-v_0 \frac{dT}{dy} = \frac{k}{\rho C_p}\frac{d^2T}{dy^2} + \frac{\mu}{\rho C_p}\left(\frac{du}{dy}\right)^2 + \lambda \frac{\sigma B_0^2}{\rho C_p} u^2 \tag{2}$$

where μ is the fluid velocity at x-axis, ρ is the fluid density, ν the kinematic viscosity, σ the electrical conductivity of the fluid and p is the fluid pressure, μ is the coefficient of viscosity, k the thermal conductivity, C_p the specific heat at constant pressure, the index λ in the equation (2) is taken equal to 1 for including Joule dissipation.

The relevant boundary conditions are as follows:

$$\mu = \gamma_1 \frac{du}{dy}, T = T_0 \; at \; y = 0$$

$$\mu = \gamma_2 \frac{du}{dy}, T = T_h \; at \; y = h \tag{3}$$

where T is the temperature of the fluid, T_h is the upper plate temperature,T_0 is the lower plate temperature and γ_1 and $\gamma_2$are the slip coefficients.

Non-dimensionalising the equations, we introduce the non-dimensional variables as-

$$\eta = \frac{y}{h}, w_1 = \frac{u}{v_0}, \varphi = \frac{T-T_0}{T_h-T_0} \tag{4}$$

From Eqs. (1) and (2), we then have

$$\frac{d^2w_1}{d\eta^2} + Re\frac{dw_1}{d\eta} - \left(M^2 + \frac{1}{D_a}\right)w_1 = -P \tag{5}$$

$$\frac{d^2\varphi}{d\eta^2} + Pe\frac{d\varphi}{d\eta} + Br\left[\left(\frac{dw_1}{d\eta}\right)^2 + \lambda M^2 w_1^2\right] = 0 \tag{6}$$

here $M^2 = \frac{\sigma B^2 h^2}{\rho v}$ is the magnetic parameter, $Br = \frac{\mu v_0^2}{k(T_h - T_0)}$ the Brinkmann number, $Pe = \frac{v_0 h \rho C_p}{k}$ the Peclet number, $Re = \frac{v_o\ h}{\nu}$ the Reynold's number, $D_a = \frac{k}{h^2}$ is the Darcy number and $P = \frac{h^2}{\rho v v_0}\left(-\frac{\partial p}{\partial x}\right)$ is the non-dimensional pressure gradient.

The boundary conditions for the above problem is:

$$w_1 = \alpha_1 \frac{dw_1}{d\eta}, \varphi = 0\ at\ \eta = 0$$

$$w_1 = \alpha_2 \frac{dw_1}{d\eta}, \varphi = 1\ at\ \eta = 1 \tag{7}$$

where $\alpha_1 = \frac{\gamma_1}{h}$ and $\alpha_2 = \frac{\gamma_2}{h}$ are the slip parameters.

The solutions of the equations subject to these boundary conditions are given by -

$$w_1(\eta) = \frac{P}{(M^2 + \frac{1}{D_a})} + (A\cosh n\eta + B\sinh n\eta)e^{\frac{-Re}{2}\eta} \tag{8}$$

where $n = \frac{[Re^2 + 4(M^2 + \frac{1}{D_a})]^{1/2}}{2}$

The solution given by the Eq. (8) is applied for both Re< 0 (for the blowing at the plates $v_0 < 0$) and $Re > 0$ (for the suction at the plates $v_0 > 0$).

By solving equation (8), equation (6) becomes

$$\frac{d^2\varphi}{d\eta^2} + Pe\ \frac{d\varphi}{d\eta} = -Br[e^{-Re\eta}\{A_1 + \frac{1}{2}(A_4\cosh 2n\eta + A_5\sinh 2n\eta)\} + \frac{2\lambda P}{\left(1+\frac{1}{D_a M^2}\right)}e^{\frac{-Re}{2}\eta}(A\cosh n\eta + B\sinh n\eta) + \frac{\lambda P^2}{(1+\frac{1}{D_a M^2})^2}] \tag{9}$$

Solution of the equation (11) subject to the boundary conditions is -

$$\varphi(\eta) = c_1 + c_2 e^{-Pe\eta} - Br\left[e^{-Re\eta}\left\{A_8 + \frac{1}{2}(A_4\cosh 2n\eta + A_5\sinh 2n\eta) + \frac{\lambda P e^{\frac{-Re}{2}\eta}}{(1+\frac{1}{D_a M^2})}(A_6\cosh n\eta + A_7\sinh n\eta) - \frac{\lambda P^2}{Pe(1+\frac{1}{D_a M^2})}\eta\right\}\right] \tag{10}$$

3. Discussion of the results

The rate of heat transfer at the plates $\eta = 0$ and $\eta = 1$ are procured as -

$$\varphi'(0) = -c_2 \mathrm{Pe} + \mathrm{Br}\left[\left\{\mathrm{ReA}_8 + \left(\mathrm{Re}\frac{\mathrm{A}_4}{2} + 2\mathrm{n}\frac{\mathrm{A}_5}{2}\right)\right\} + \frac{\lambda \mathrm{P}}{\left(1+\frac{1}{\mathrm{D_a M^2}}\right)}\left(\mathrm{nA}_7 - \frac{\mathrm{Re}}{2}\mathrm{A}_6\right) + \frac{\lambda \mathrm{P}^2}{\mathrm{Pe}\left(1+\frac{1}{\mathrm{D_a M^2}}\right)^2}\right] \quad (11)$$

$$\varphi'(1) = -c_2 Pe\, e^{-Pe} + Br\left[e^{-Re}\left\{ReA_8 + \left(Re\frac{A_4}{2} + 2n\frac{A_5}{2}\right)\cosh 2n + \left(Re\frac{A_5}{2} + 2n\frac{A_4}{2}\right)\sinh 2n\right\} - \frac{\lambda Pe^{\frac{-Re}{2}}}{\left(1+\frac{1}{D_a M^2}\right)}\left\{\left(\frac{1}{2}ReA_6 + nA_7\right)\cosh n + \left(\frac{1}{2}ReA_7 + nA_6\right)\sinh n\right\} + \frac{\lambda P^2}{Pe\,(1+\frac{1}{D_a M^2})}\right] \quad (12)$$

All the constants used above have been given in the appendix.

Table 1 :-Rate of heat transfer at the plates $\eta = 0$ and $\eta = 1$ when $Br = 2, \alpha_1 = 0.1, \alpha_2 = 0.1, Pe = 3$ and $D_a = 0.2$

The rate of heat transfer $\varphi'(0)$ and $\varphi'(1)$ is displayed in Tables 1 to 3 numerically for various values of different parameters such as M^2, Re, Br, Pe, D_a, α_1 and α_2. From Table 1, it is noticed that the rate of heat transfer $\varphi'(0)$ decreases with an increase in Reynold's number Re while for increase in magnetic parameter M^2, it decreases near the surface and it increases away from the surface. Also, it can be seen that the rate of heat transfer $\varphi'(1)$ at the plate $\eta = 1$ increases as the Reynold's number Re increases and decreases as the magnetic parameter M^2 decreases. From Table 2, we find that the rate of heat transfer increases for increase in the both Brinkmann number (Br) and the Peclet number(Pe) at the plates η=0. On the other hand, at the plates η=1, the rate of heat transfer decreases for the increase in Brinkmann number(Br) as well as the Peclet number Pe. From Table 3, it is expressed that the rate of heat transfer at the plate η=0 increases with an increase in slip parameter α_1 whereas for the slip parameter α_2, the rate of heat transfer increases near the plate and decreases away from the plate. The rate of heat transfer $\varphi'(1)$ at the plate η=1 shows a decrease with the increase in the slip parameter α_1 and for the increase in the slip parameter α_2, it decreases near the plate and increases away from the plate.

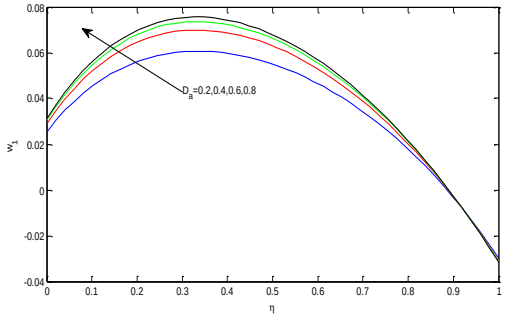

Figure 1 Velocity profiles for different D_a when $M^2 = 5$, $\alpha_1 = 0.1$,$\alpha_2 = 0.1$, $Re = 2$ and $D_a = 0.2$

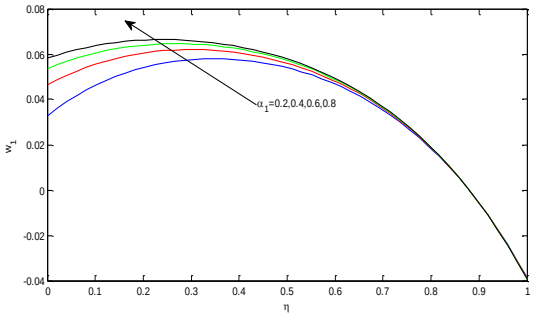

Figure 2 Velocity profiles for different α_1 when $M^2 = 5$, $\alpha_2 = 0.1$, $Re = 0.5$ and $D_a = 0.2$

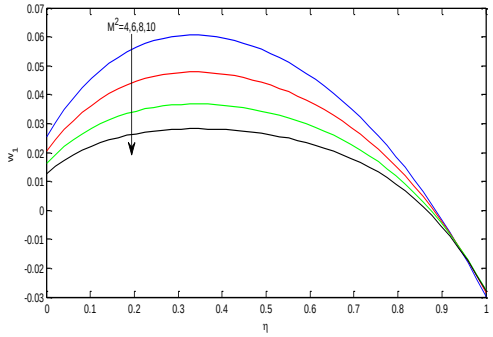

Figure 3 Velocity profiles for different M^2 when $Re = 2, \alpha_1 = 0.1$,$\alpha_2 = 0.1$ and $D_a = 0.2$

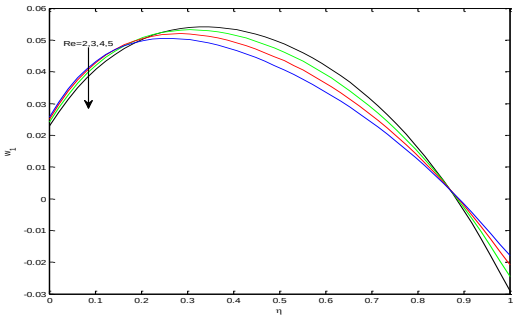

Figure 4 Velocity profiles for different Re when $M^2 = 5$, $\alpha_1 = 0.1$,$\alpha_2 = 0.1$ and $D_a = 0.2$

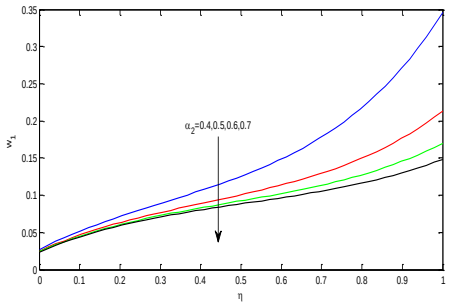

Figure 5 Velocity profiles for different α_2 when $M^2 = 5$, $\alpha_1 = 0.1, Re = 0.1$ and $D_a = 0.2$

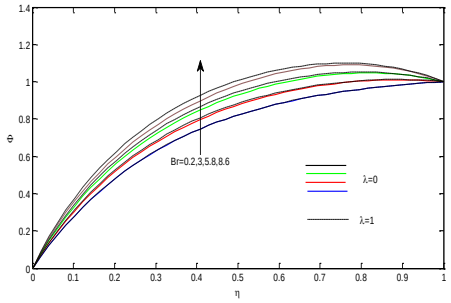

Figure 6 Temperature profiles for different Br when $Re = 2, D_a = 0.2$ and $Pe = 3$

The non-dimensional velocity w_1 has been plotted against η the space coordinate for studying the effects of magnetic field and Reynold's number on the velocity. It is seen from figures (1 to 5) that the velocity of the fluid shows an increase with the increase in the Darcy number (D_a) and slip parameter(α_1) while for the magnetic parameter (M^2), Reynold's number(Re) and slip parameter (α_2), it diminishes. The Lorentz force causes the resistance to the flow of the fluid resulting in the decrease in the fluid velocity. The larger is the value of the Reynold's number, the higher is the strength of suction/injection showing a decrease in the velocity of the fluid as represented in Figure 2.

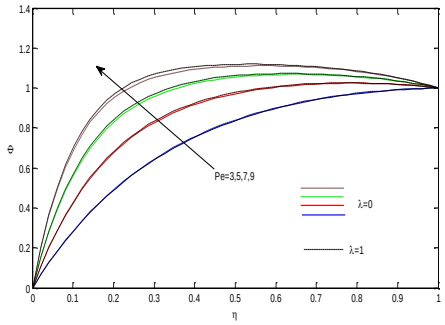

Figure 7 Temperature profiles for different Pe when $Br = 1, D_a = 0.2$ and $Re = 2$

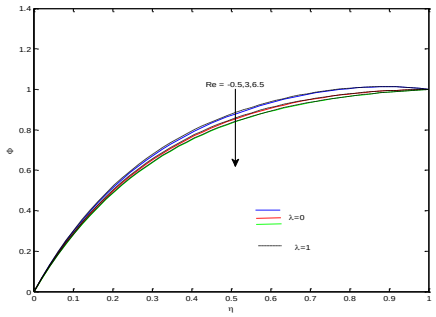

Figure 8 Temperature profiles for different Re when $Br = 1, Pe = 3$ and $D_a = 0.2$

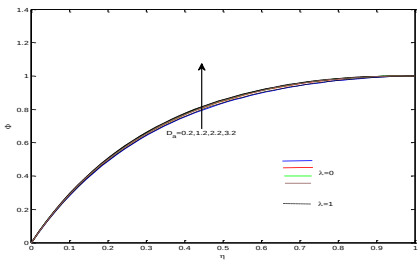

Figure 9 Temperature profiles for different D_a when $Br = 1, Pe = 3$ and $Re = 2$

In case of the temperature profiles, the temperature of the fluid has been displayed in the figures(6 to 9). From the graphs, it is evident that the temperature of the fluid increases with the increase in the Brinkmann number(Br) and Peclet number(Pe) whereas the temperature decreases with the decrease in the Reynold's number (Re). Darcy number(D_a) don't have any significant effect on the temperature field as illustrated in Figure 9.

5. Entropy Generation

Physically, entropy is the disorder of a system and the surrounding.In microscopic level, it occurs when heat transfer occurs because heat is a energy, when it moves some additional movement happens eg molecular friction, molecular vibration, internal displacement of molecule, spin moment, kinetic energy etc. which make loses useful heat, thus heat can't be transformed fully into work. This additional movements create chaos in the system and the surroundings, that's why sometimes entropy is called the measure of the chaos. For this, microscopic chaos results in macroscopic level which occurs because some unnecessary irreversibilities eg friction, mixing of fluids, electric resistance, inelastic deformation of solids, chemical reaction and unnecessary heat transfer in finite temperature difference. Noting that such kind of energy loss can't be regained so system and surrounding can't come to its initial state without extra work done on it. Therefore, Entropy is called the measure of irreversibilities.For this cause, heat can't be transformed fully into work. In real life, all sort of process has this kind of macroscopic and microscopic loss. So in reality each and every thermodynmanic process is an irreversible process. So in reality each and every thermodynamic process is an irreversible process.

Entropy generation occurs due to irreversiblity of process or in simple terms due to irreversibility of process or in simple terms due to friction associated during the process. Entropy generation is zero for reversible process. Woods[27] has indicated the local volumetric rate of entropy generation for a viscous incompressible conducting fluid in the presence of magnetic field as:

$$E_G = \frac{k}{{T_0}^2}\left(\frac{dT}{dy}\right)^2 + \frac{\mu}{T_0}\left(\frac{du}{dy}\right)^2 + \lambda\frac{\sigma B_0^2}{T_0}u^2 \tag{13}$$

The entropy generation above comprises of three terms, the first one is the irreversibility due to the heat transfer, the second one is the entropy generation due to viscous dissipation and the last one is local entropy generation due to the effect of magnetic field. (Joule heating or Ohmic heating)

The entropy generation number in dimensionless form is given as:

$$N_s = \frac{T_0^2 h^2 E_G}{k(T_h - T_{0)}} \tag{14}$$

For velocity and temperature without dimensions, the entropy generation number is given as:

$$N_s = \left(\frac{d\varphi}{dy}\right)^2 + \frac{Br}{\Omega}\left[\left(\frac{dw_1}{d\eta}\right)^2 + \lambda M^2 w_1^2\right]$$

where $Br = \frac{\mu v_0^2}{k(T_h - T_0)}$ is the Brinkmann number and $\Omega = \frac{T_h - T_0}{T_o}$, the non dimensional temperature difference.

The entropy generation number is written as a combination of the entropy generation due to heat transfer given by N_1 and the entropy generation due to fluid friction with magnetic field denoted by N_2 given as,

$$N_1 = \left(\frac{d\varphi}{d\eta}\right)^2, N_2 = \frac{Br}{\Omega}\left[\left(\frac{dw_1}{d\eta}\right)^2 + \lambda M^2 w_1^2\right]$$

Paoletti et al[25] introduced an alternative irreversibility distribution parameter in terms of Bejan number(Be) which is given as:

Be $= \frac{N_1}{N_s} = \frac{1}{1+\epsilon}$

where $\epsilon = \frac{N_2}{N_1}$ is the irreversibility ratio.

When $0 \leq \epsilon < 1$, heat transfer is prepotent while for $\epsilon > 1$, fluid friction with magnetic effects is ascendant. Heat transfer and fluid friction both have influence of same magnitude to entropy generation for $\epsilon = 1$. From [12], it is clear that the Bejan number (Be) has its values lying between 0 and 1. It approaches zero when the entropy generation due to the combined effects of fluid friction and magnetic field is dominant. Similarly, Be = 0.5 indicates that the irreversibility due to heat transfer dominates with Be=1 as the limit at which the irreversibility is solely due to heat transfer.

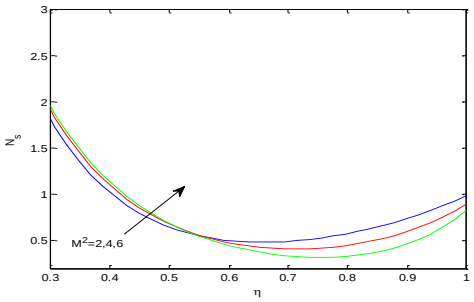

Figure10 N_s for different $M^2$when $Pe = 3, \alpha_1 = 0.1, \alpha_2 = 0.1, Br = 1, Br\Omega^{-1} = 1, Re = 2$ and $D_a = 0.4$

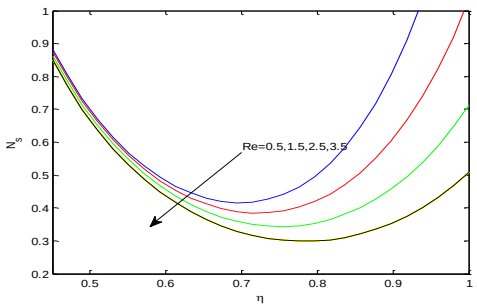

Figure11 N_s for different Re when $Pe = 2, \alpha_1 = 0.1, \alpha_2 = 0.1, Br = 1, Br\Omega^{-1} = 1, M^2 = 5$ and $D_a = 0$.

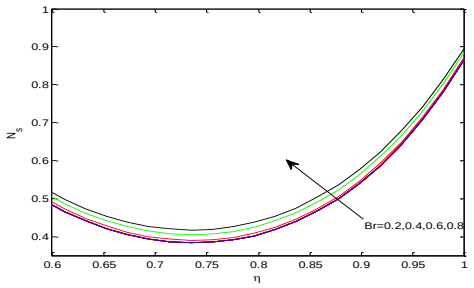

Figure12 N_s for different Br when $Pe = 2, \alpha_1 = 0.1, \alpha_2 = 0.1, Re = 2, Br\Omega^{-1} = 1, M^2 = 5$ and $D_a = 0$

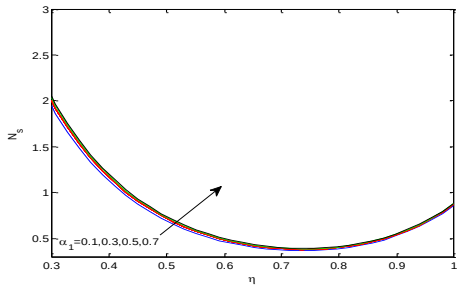

Figure13 N_s for different α_1 when $Pe = 3, Re = 2, \alpha_2 = 0.1, Br = 1, Br\Omega^{-1} = 1, M^2 = 5$ and $D_a = 0.4$

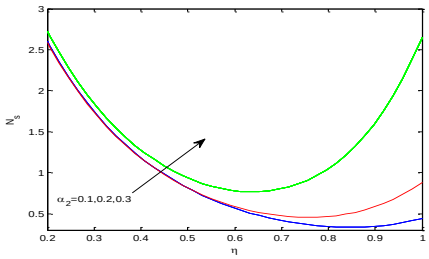

Figure 14 N_s for different α_2 when $Pe = 3, Re = 2, \alpha_1 = 0.1, Br = 1, Br\Omega^{-1} = 1, M^2 = 5$ and $D_a = 0.4$

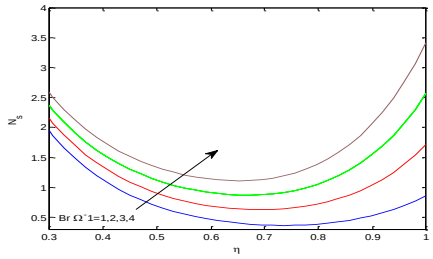

Figure 15 N_s for different $Br\Omega^{-1}$ when $Pe = 3, Re = 2, \alpha_1 = 0.1, \alpha_2 = 0.1, Br = 1, M^2 = 5$ and $D_a = 0.4$

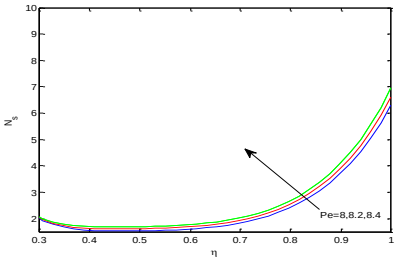

Figure 16 N_s for different Pe when $Re = 2, \alpha_1 = 0.1, \alpha_2 = 0.1, Br = 1, Br\Omega^{-1} = 1, M^2 = 5$ and $D_a = 0.4$

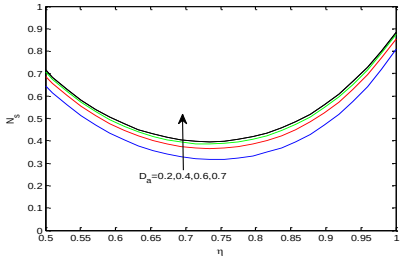

Figure 17 N_s for different D_a when $Re = 2, \alpha_1 = 0.1, \alpha_2 = 0.1, Pe = 3, Br = 1, Br\Omega^{-1} = 1$ and $M^2 = 5$

The impact of various controlling parameters on the entropy generation is given in the figures (10 to 17). Figure 10 shows that the entropy generation N_s increases near the lower plate of the channel and far away from it the reverse trend is exhibited. Figure 11 shows that the increase in the Reynold's number leads to the decrease in the entropy generation rate. From figure (12 to 17), it is found that the entropy generation number increases with the increase in Brinkmann number(Br), slip parameter (α_1) and (α_2), group parameter $(Br\Omega^{-1})$, Peclet number(Pe) and Darcy number(D_a).The temperature gradient within the channel has an increase in its value due to increase in the temperature of the fluid, as a result the entropy generation number has a rise in its value. The enhancement in the values of entropy generation number with an increase in group parameter $Br\Omega^{-1}$ is observed due to increase in the irreversibility of the fluid friction.

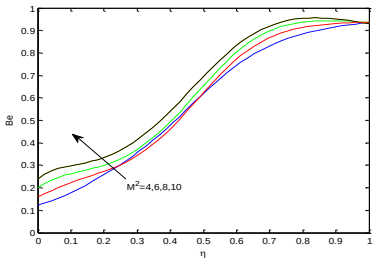

Figure18 Bejan number for different M^2 when $Re = 2, \alpha_1 = 0.1, \alpha_2 = 0.1, Br = 1, Br\Omega^{-1} = 1, D_a = 0.4$ and $Pe = 3$

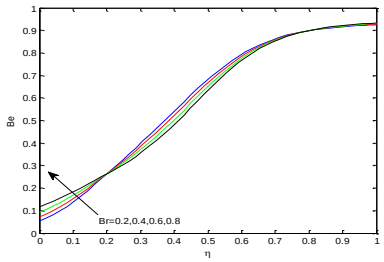

Figure 19 Bejan number for different Br when $M^2 = 5, Re = 2, \alpha_1 = 0.1, \alpha_2 = 0.1, Br\Omega^{-1} = 1, D_a = 0.4$ and $Pe = 3$

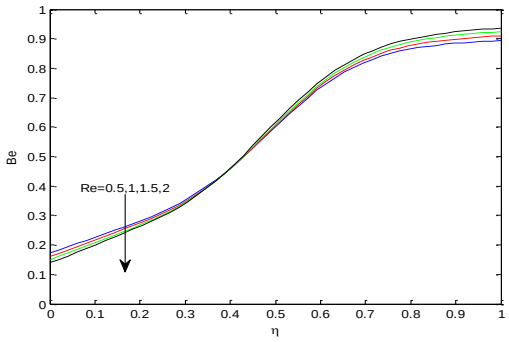

Figure 20 Bejan number for different Re when $M^2 = 5$, $Br = 1$,$\alpha_1 = 0.1, \alpha_2 = 0.1, Br\Omega^{-1} = 1, D_a = 0.4$ and $Pe = 3$

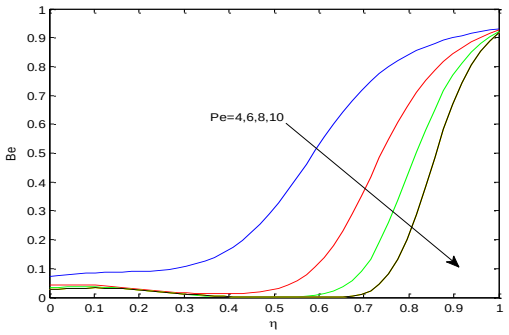

Figure 21 Bejan number for different Pe when $M^2 = 5$, $Br = 1$,$\alpha_1 = 0.1, \alpha_2 = 0.1, Br\Omega^{-1} = 1, D_a = 0.4$ and $Re = 2$

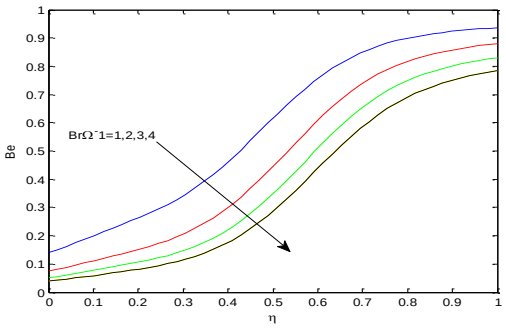

Figure 22 Bejan number for different $Br\Omega^{-1}$ when $M^2 = 5$, $Br = 1$,$\alpha_1 = 0.1, \alpha_2 = 0.1, Pe = 3, D_a = 0.4$ and $Re = 2$

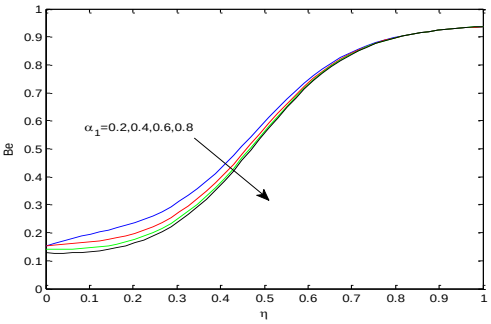

Figure 23 Bejan number for different α_1 when $M^2 = 5$, $Br = 1, \alpha_2 = 0.1, Pe = 3, D_a = 0.4, Br\Omega^{-1} = 1$ and $Re = 2$

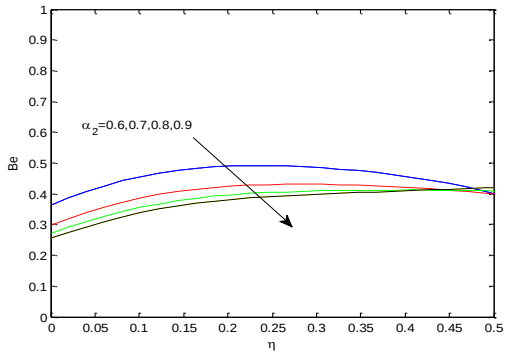

Figure 24 Bejan number for different α_2 when $M^2 = 5$, $Br = 1, \alpha_1 = 0.1, Pe = 3, D_a = 0.4, Br\Omega^{-1} = 1$ and $Re = 2$

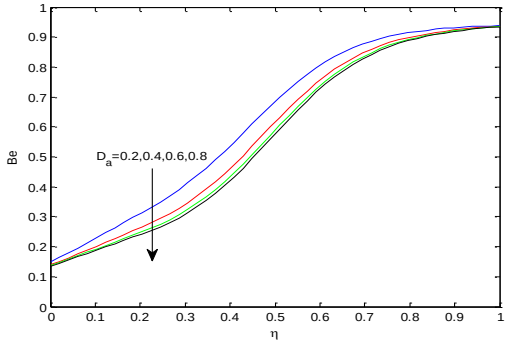

Figure 25 Bejan number for different D_a when $M^2 = 5$, $Br = 1, \alpha_1 = 0.1,\ \alpha_2 = 0.1, Pe = 3, Br\Omega^{-1} = 1$ and $Re = 2$

Now the effect of various parameters on Bejan number(Be) is shown in the figures (17 to 24).It is clear from these figures that the Bejan number(Be) shows an increase with the increasing Magnetic parameter(M^2) and Brinkmann number(Br).On the other hand ,it

reduces with the increasing parameters Reynold's number(Re),Peclet number(Pe),group parameter($\mathrm{Br}\Omega^{-1}$),slip parameter (α_1) and (α_2) and Darcy number(D_a).Group parameter plays an important role in analyzing the irreversibility. The viscous effects to that of temperature gradient entropy generation are governed by this number. It is observed from the figures that the Bejan number(Be) shows a decrease near the lower plate $\eta = 0$ while it increases near the upper plate $\eta = 1$ with the increase in the Reynold's number(Re).

6. Closing Remarks

The combined effect of viscous dissipation, magnetic field, porous media, suction/ injection and slip conditions on entropy generation in a fluid through horizontal porous channels have been investigated. To obtain the entropy production, the analytical results obtained for the velocity and temperature profiles have been used. The velocity and temperature profiles have been plotted by solving equations (5) & (6) with the help of 'bvp4c' function in Matlab software[see(3)]. The non-dimensional entropy generation number and Bejan number have been resolved. The effects of various parameters on the entropy generation number and the rate of heat transfer have been discussed. It is observed that:

1. Velocity of the fluid increases with the increase in the Darcy number and slip parameter α_1 while for magnetic parameter, Reynold's number and slip parameter α_2, it decreases.
2. Temperature of the fluid increases with the increase in the Peclet number and Brinkmann number whereas the temperature decreases with the increase in the Reynold's number. Also, Darcy number don't have much effect on the temperature of the fluid.
3. For increase in the magnetic parameter, the entropy generation N_s increase near the lower plate of the channel and far away from it, it decreases. Alongwith, the entropy generation decreases with the increase in the Reynold's number while it shows an increase with Brinkmann number, slip parameters α_1 and α_2,group parameter, Peclet number and Darcy number.
4. Bejan number shows an increase with the increase in magnetic parameter and Brinkmann number and reduces with the increase in Reynold's number, Peclet number, group parameter, slip parameters α_1 and α_2 and Darcy number.

The entropy generation optimization is helpful to engineer and scientists for designing thermal systems with lesser loss of energy as a result there is availability of maximum possible energy.

Abstract The traces of powers of matrices frequently arise in several fields of mathematics. Rhotrices are a new paradigm of matrices which are represented as coupled matrices. The main aim of this paper is to find the trace of positive integral powers of three and five dimensional rhotrices. Further, the trace of positive integral powers of special type of circulant rhotrix is also discussed.

Key words Rhotrix, trace of a rhotrix, determinant, circulant rhotrix.

2020 Mathematics Subject Classification 15A09, 20H30, 11T71.

1 Introduction

The trace of a positive integer power of a matrix needs to be evaluated in various problems in Network Analysis, Number Theory, Matrix Theory, Dynamical Systems and Differential Equations. To study a complex network, we need to compute the total number of triangles of a connected simple graph. The trace of integral powers of square matrices was discussed by Michiel [6] and Pahade and Jha [7]. Cisneros et al. [4] and Cisneros [5] discussed a formula for the trace of symmetric powers of a matrix. Also, Brezinski et al. [3] estimated the trace of powers of self adjoint operators. Zareula [14] discussed the congruences for the trace of powers of some matrices.
Rhotrix is a new paradigm in the study of matrix theory. Rhotrix is represented as coupled matrix. Ajibade [2] defined a 3–dimensional rhotrix, which is, in some way, between 2×2–dimensional and 3×3–dimensional matrices as

$$R_3 = \left\langle \begin{array}{ccc} & a & \\ b & c & d \\ & e & \end{array} \right\rangle,$$

where a, b, c, d, e are real numbers and $h(R_3) = c$ is called the heart of rhotrix R_3.

Let $Q_3 = \left\langle \begin{array}{ccc} & f & \\ g & h & j \\ & k & \end{array} \right\rangle$, be another 3-dimensional rhotrix, then the addition of two rhotrices is defined as

$$R_3 + Q_3 = \left\langle \begin{array}{ccc} & a & \\ b & c & d \\ & e & \end{array} \right\rangle + \left\langle \begin{array}{ccc} & f & \\ g & h & j \\ & k & \end{array} \right\rangle = \left\langle \begin{array}{ccc} & a+f & \\ b+g & c+h & d+j \\ & e+k & \end{array} \right\rangle,$$

and for any real number α, the scalar multiplication of a rhotrix R_3 by α is defined as

$$\alpha\, R_3 = \alpha \left\langle \begin{array}{ccc} & a & \\ b & c & d \\ & e & \end{array} \right\rangle = \left\langle \begin{array}{ccc} & \alpha\, a & \\ \alpha\, b & \alpha\, c & \alpha\, d \\ & \alpha\, e & \end{array} \right\rangle.$$

Two types of multiplications of rhotrices are discussed in the literature of rhotrices, namely, the heart oriented multiplication and the row-column multiplication. Ajibade [2] discussed the heart oriented multiplication of 3-dimensional rhotrices as given below:

Let $Q_3 = \left\langle \begin{array}{ccc} & f & \\ g & h & j \\ & k & \end{array} \right\rangle$,be another 3-dimensional rhotrix, then the multiplication of two rhotrices is defined as

$$R_3\, o\; Q_3 = \left\langle \begin{array}{ccc} & ah+fc & \\ bh+gc & ch & dh+jc \\ & eh+kc & \end{array} \right\rangle.$$

Further, Absalom et al. [1] generalized the heart oriented multiplication of 3-dimensional rhotrices to n-dimensional rhotrices. The row column multiplication of 3-dimensional rhotrices is defined by Sani [8] as

$$R_3\, o\, Q_3 = \left\langle \begin{array}{ccc} & a & \\ b & c & d \\ & e & \end{array} \right\rangle \left\langle \begin{array}{ccc} & f & \\ g & h & j \\ & k & \end{array} \right\rangle = \left\langle \begin{array}{ccc} & af+dg & \\ bf+eg & ch & aj+dk \\ & bj+ek & \end{array} \right\rangle.$$

Sani [9] also discussed the row-column multiplication of high dimension rhotrices as follows: Consider an n-dimensional rhotrix

$$P_n = \left\langle \begin{array}{ccccccc} & & & a_{11} & & & \\ & & a_{21} & c_{11} & a_{12} & & \\ & a_{31} & c_{21} & a_{22} & c_{12} & a_{13} & \\ \cdots & \cdots & \cdots & \cdots & \cdots & \cdots & \cdots \\ a_{t1} & \cdots & \cdots & \cdots & \cdots & \cdots & a_{1t} \\ \cdots & \cdots & \cdots & \cdots & \cdots & \cdots & \cdots \\ & a_{tt-2} & c_{t-1t-2} & a_{t-1t-1} & c_{t-2t-1} & a_{t-2t} & \\ & & a_{tt-1} & c_{t-1t-1} & a_{t-1t} & & \\ & & & a_{tt} & & & \end{array} \right\rangle,$$

where $t = (n+1)/2$. Sani [10] represented rhotrix as a coupled matrix and denoted it as $P_n = \langle a_{ij},\ c_{lk} \rangle = \langle A, C \rangle$ with $i, j = 1, 2, ..., t$ and $l, k = 1, 2, ..., t-1$. The multiplication of two rhotrices P_n and Q_n defined by Sani [9] is as follows:

$$P_n\, o\, Q_n = \langle a_{i_1 j_1},\, c_{l_1 k_1} \rangle\; o\; \langle b_{i_2 j_2},\, d_{l_2 k_2} \rangle = \left\langle \sum_{i_2 j_1 = 1}^{t} (a_{i_1 j_1}\, b_{i_2 j_2}),\ \sum_{l_2 k_1 = 1}^{t-1} (c_{l_1 k_1}\, d_{l_2 k_2}) \right\rangle.$$

Sharma and Kanwar [11, 12] defined the trace of a rhotrix and discussed its properties. Sharma et al. [13] introduced circulant rhotrices in the literature of rhotrices.

Definition 1.1. [11] Let

$$R_n = \left\langle \begin{array}{ccccccccc} & & & & a_{11} & & & & \\ & & & a_{21} & c_{11} & a_{12} & & & \\ & & a_{31} & c_{21} & a_{22} & c_{12} & a_{13} & & \\ & .. & .. & .. & .. & .. & .. & .. & \\ a_{t1} & c_{t-11} & .. & .. & .. & .. & .. & c_{1t-1} & a_{1t} \\ & .. & .. & .. & .. & .. & .. & .. & \\ & & a_{t\,t-2} & c_{t-1t-2} & a_{t-1t-1} & c_{t-2t-1} & a_{t-2t} & & \\ & & & a_{t\,t-1} & c_{t-1t-1} & a_{t-1t} & & & \\ & & & & a_{tt} & & & & \end{array} \right\rangle$$

$$= \langle a_{i\,j},\ c_{l\,k} \rangle = \langle A,\ C \rangle\ ,$$

be a rhotrix, where $a_{i\,j},\ c_{l\,k} \in \mathbb{R}$, $1 \leq i, j \leq t$, $1 \leq l, k \leq t-1$ and $t = \frac{n+1}{2}$.
The trace of R_n is defined as

$$\begin{aligned} Tr\ R_n &= \sum_{i=1}^{t} a_{ii} + \sum_{i=1}^{t-1} c_{ii} \\ &= Tr\ A + Tr\ C \\ &= \sum_{r=1}^{t} x_{rs} \end{aligned}$$

That is, the trace of a rhotrix R_n, which is the sum of all its elements of the vertical diagonal, where $R_n = \langle x_{r\,s} \rangle$ is the general representation to the n–dimensional rhotrix. The elements $x_{r\,s}$ for $r = s\,(r \neq s)$ represent the vertical (non–vertical) diagonal entries of the rhotrix R_n.

2 Trace of positive integral powers of a three dimensional rhotrix

In this section, we put forward a result to evaluate the trace of any positive integral power of a three dimensional rhotrix.

Theorem 2.1. *Let $R_3 =< A, B >$ be a three dimensional rhotrix whose coupled matrices are $A = (a_{ij})_{2\times 2}$ and $B = (c)_{1\times 1}$. Then, the trace of R_3^n, where n is positive even integer, is given by:*

$$TrR_3^n = (TrA)^n - n.|A|.(TrA)^{n-2} + \frac{n\,(n-3)}{2!}.|A|^2.(TrA)^{n-4} - \frac{n\,(n-4)\,(n-5)}{3!}.|A|^3.(TrA)^{n-6} +$$
$$\ldots + (-1)^{\frac{n}{2}} \frac{n\left(n-\frac{n}{2}-1\right)\left(n-\frac{n}{2}-2\right)\ldots . up\ to\ \frac{n}{2}\ terms}{\left(\frac{n}{2}\right)!}.|A|^{\frac{n}{2}}\,(TrA)^{n-2\cdot\frac{n}{2}} + (TrB)^n.$$

Proof. Consider a three dimensional rhotrix

$$R_3 = \left\langle \begin{array}{ccc} & a & \\ b & c & d \\ & e & \end{array} \right\rangle,$$

where a, b, c, d, e are real numbers and the coupled matrices are given as $A = \begin{bmatrix} a & d \\ b & e \end{bmatrix}$ and $B = [c]$.
Then, $|A| = ae - bd$ and $Tr\ A = a + e$.

$$A^2 = \begin{bmatrix} a^2 + bd & d(a+e) \\ b(a+e) & bd + e^2 \end{bmatrix}$$

and

$$\begin{aligned} Tr\ A^2 &= a^2 + 2bd + e^2 = a^2 + 2ae + e^2 - 2ae + 2bd \\ &= (a+e)^2 - 2(ae - bd) \end{aligned}$$

or,

$$TrA^2 = (TrA)^2 - 2.\,|A|\,. \tag{2.1}$$

Similarly,

$$A^3 = \begin{bmatrix} a^3 + abd + bd(a+e) & a^2d + d^2b + ed(a+e) \\ ab\,(a+e) + b^2d + e^2b & bd\,(a+e) + dbe + e^3 \end{bmatrix}$$

and

$$Tr\ A^3 = a^3 + e^3 + 3bd(a+e) = (a+e)^3 - 3(a+e)(ae - bd)$$

or,

$$TrA^3 = (TrA)^3 - 3.\,|A|\,.\,Tr\ A. \tag{2.2}$$

Replacing A by A^2 in (2.1), we get

$$Tr\ (A^2)^2 = \left(TrA^2\right)^2 - 2.\,|A^2|$$
$$= ((TrA)^2 - 2.\,|A|)^2 - 2(|A|)^2$$

or,

$$TrA^4 = (TrA)^4 - 4.\,|A|\,.(TrA)^2 + \frac{4(4-3)}{2!}.|A|^2.(TrA)^{4-2.\frac{4}{2}}$$

Also, replacing A by A^2 in (2.2), we get

$$Tr\ A^6 = Tr\ (A^2)^3 = \left(TrA^2\right)^3 - 3.\,|A^2|\,.\,TrA^2$$

$$= ((TrA)^2 - 2.\,|A|)^3 - 3.(|A|)^2((Tr\ A)^2 - 2.\,|A|)$$
$$= (TrA)^6 - 8.|A|^3 - 6.\,|A|\,.(TrA)^4 + 12|A|^2.\ (TrA)^2 - 3.(|A|)^2(Tr\ A)^2 + 6.(|A|)^3$$
$$TrA^6 = (TrA)^6 - 6.\,|A|\,.(TrA)^4 + \frac{6\,(6-3)}{2!}.|A|^2.\ (TrA)^2 - \frac{6\,(6-4)\,(6-5)}{3!}.|A|^3.\ (TrA)^{6-2.\frac{6}{2}}.$$

Thus, when n is an even integer, then

$$TrA^n = (TrA)^n - n.|A|.(TrA)^{n-2} + \frac{n\,(n-3)}{2!}.|A|^2.(TrA)^{n-4} - \frac{n\,(n-4)\,(n-5)}{3!}.|A|^3.(TrA)^{n-6} +$$
$$\ldots + (-1)^{\frac{n}{2}}\frac{n\left(n-\frac{n}{2}-1\right)\left(n-\frac{n}{2}-2\right)\ldots \text{up to } \frac{n}{2} \text{ terms}}{\left(\frac{n}{2}\right)!}.|A|^{\frac{n}{2}}(TrA)^{n-2.\frac{n}{2}}.$$

Also,

$$Tr\ B^n = c^n$$

By Definition 1.1 we know that

$$Tr\ R_3 = Tr\ A + Tr\ B.$$

Therefore,

$$TrR_3^n = Tr\ A^n + Tr\ B^n.$$

Hence,

$$TrR_3^n = \sum\nolimits_{k=0}^{n/2} \frac{(-1)^k}{k!} \cdot (n(n-k-1)(n-k-2)\ldots \text{up to } k \text{ terms}) \cdot |A|^k (TrA)^{(n-2k)} + c^n$$

where n is an even integer.

□

Example 2.2. Let

$$R_3 = \left\langle \begin{matrix} & 1 & \\ 2 & 1 & -1 \\ & 2 & \end{matrix} \right\rangle$$

be a three dimensional rhotrix such that its coupled matrices are $A = \begin{bmatrix} 1 & -1 \\ 2 & 2 \end{bmatrix}$ and $B = [1]$. Then, $Tr\ A = 3$ and $|A| = 4$ and $Tr\ B = 1$. Now,

$$Tr\ A^{10} = \sum_{k=0}^{5} \frac{(-1)^k}{k!}(n\,(n-k-1)\,(n-k-2)\ldots \text{up to } k \text{ terms}).|A|^k (TrA)^{n-2k}$$

$$= (TrA)^{10} - 10.|A|.(TrA)^8 + \frac{10.7}{2!}.|A|^2.(TrA)^6 - \frac{10.6.5}{3!}.|A|^3(TrA)^4 + \frac{10.5.4.3}{4!}.|A|^4(TrA)^2 - \frac{10.4.3.2.1}{5!}.|A|^5$$

$$= (3)^{10} - 10.4.(3)^8 + 35.(4)^2.(3)^6 - 50.(4)^3.(3)^4 + 25.(4)^4.(3)^2 - 2(4)^5 = 1201$$

and $Tr\ B^{10} = 1$. Therefore, ${R_3}^{10} = 1201 + 1 = 1202$.

Theorem 2.3. *Let $R_3 =< A, B >$ be a three dimensional rhotrix whose coupled matrices are $A = (a_{ij})_{2\times 2}$ and $B = (c)_{1\times 1}$ .Then, the trace of R_3^n where, n is a positive odd integer, is given by*

$$TrR_3^n = \sum_{k=0}^{\frac{n-1}{2}} \frac{(-1)^k}{k!} \cdot (n(n-k-1)(n-k-2)\dots \text{up to } k \text{ terms}) \cdot |A|^k \cdot (TrA)^{n-2k} + (TrB)^n$$

where $|A| = \det A$.

Proof. Consider a three dimensional rhotrix

$$R_3 = \left\langle \begin{array}{ccc} & a & \\ b & c & d \\ & e & \end{array} \right\rangle$$

where a, b, c, d, e are real numbers and the coupled matrices are given by $A = \begin{bmatrix} a & d \\ b & e \end{bmatrix}$ and $B = [c]$.

Then, from the Theorem 2.1 TrA^3 is given by

$$TrA^3 = (TrA)^3 - 3.|A|.Tr\ A$$

$$= (TrA)^{3-2.0} + \frac{(-1)^1}{1!}.|A|^1.(Tr\ A)^{3-2.1}.$$

Similarly,

$$A^5 = A^3.A^2$$

$$= \begin{bmatrix} a^3 + abd + bd(a+e) & a^2d + d^2b + ed(a+e) \\ ab(a+e) + b^2d + e^2b & bd(a+e) + dbe + e^3 \end{bmatrix} \begin{bmatrix} a^2 + bd & d(a+e) \\ b(a+e) & bd + e^2 \end{bmatrix}$$

Now,

$$TrA^5 = a^5 + a^3bd + 2a^2bd(a+e) + a^3bd + ab^2d^2 + 4b^2d^2(a+e) + ebd(a+e)^2$$
$$+ abd(a+e)^2 + 2e^2bd(a+e) + eb^2d^2 + 2e^3bd$$
$$= (a+e)^5 - 5.(ae-bd).(a+e)^3 + 5(ae-bd)^2.(a+e)$$
$$= (TrA)^5 - 5.|A|.(TrA)^3 + \frac{5(5-3)}{2!}.|A|^2.(Tr\ A)$$
$$= (TrA)^{5-2.0} + \frac{(-1)^1}{1!}.5.|A|^1.(TrA)^{5-2.1} + \frac{(-1)^2}{2!}5(5-3).|A|^2.(Tr\ A)^{5-2.2}$$

Thus, when n is an odd integer, then

$$TrA^n = \sum_{k=0}^{\frac{n-1}{2}} \frac{(-1)^k}{k!} \cdot (n(n-k-1)(n-k-2)\dots \text{ up to } k \text{ terms}) \cdot |A|^k (TrA)^{n-2k}.$$

Also,

$$Tr\ B^n = c^n.$$

Sharma and Kanwar [11] showed that the trace of a rhotrix is given by,

$$Tr\ R_3 = Tr\ A + Tr\ B.$$

Therefore,

$$TrR_3^n = Tr\ A^n + Tr\ B^n.$$

Hence,

$$TrR_3^n = \sum_{k=0}^{\frac{n-1}{2}} \frac{(-1)^k}{k!} \cdot (n(n-k-1)(n-k-2)\dots \text{up to } k \text{ terms}) \cdot |A|^k (TrA)^{n-2k} + c^n$$

where n is an odd positive integer.

□

Example 2.4. Let

$$R_3 = \left\langle \begin{array}{ccc} & 1 & \\ 2 & 1 & -1 \\ & 2 & \end{array} \right\rangle$$

be a three dimensional rhotrix such that its coupled matrices are $A = \begin{bmatrix} 1 & -1 \\ 2 & 2 \end{bmatrix}$ and $B = [1]$. Then, $Tr\ A = 3$ and $|A| = 4$ and $Tr\ B = 1$. Now,

$$Tr\ A^9 = \sum_{k=0}^{4} \frac{(-1)^k}{k!} \cdot (n\,(n-k-1)\,(n-k-2)\ldots \text{up to } k \text{ terms}) \cdot |A|^k (TrA)^{n-2k}$$

$$= (TrA)^9 - 9.\,|A|\,.\,(TrA)^7 + \frac{9.7}{2!}.|A|^2.(TrA)^5 - \frac{9.5.4}{3!}.\,|A|^3(TrA)^3 + \frac{9.4.3}{4!}.|A|^4\ .TrA$$

$$= (3)^9 - 9.4.\ (3)^7 + \frac{63}{2}.\,(4)^2.\ (3)^5 - 30.(4)^3.\,(3)^3 + \frac{9}{2}.\ (4)^4.3 = 15039$$

and $Tr\ B^{10} = 1$. Therefore,

$$Tr\ {R_3}^{10} = 15039 + 1 = 15040.$$

3 Trace of positive integral powers of a five dimensional rhotrix

In this section, we put forward a result to evaluate the trace of any positive power of a five dimensional rhotrix.

Theorem 3.1. *Let $R_5 =< A, B >$ be a five dimensional rhotrix whose coupled matrices are $A = (a_{ij})_{3\times 3}$ and $B = (b_{ij})_{2\times 2}$. Then, the trace of R_5^n where n is a positive even integer is given by*

$$Tr\ R_5^n$$
$$= \sum\nolimits_{r_1=0}^{\lfloor \frac{n}{3} \rfloor} \left[\sum\nolimits_{r_0=0}^{\lfloor \frac{n-3r_1}{2} \rfloor} \frac{(-1)^{r_0}}{r_0!} [n\,(n-r_0-2r_1-1)\,(n-r_0-2r_1-2)\ldots(n-2r_0-3r_1+1)] \times \right.$$
$$\left. (TrA)^{n-2r_0-3r_1}.A_2^{r_0} \right] \frac{(|A|)^{r_1}}{r_1!} + \sum\nolimits_{k=0}^{\frac{n}{2}} \frac{(-1)^k}{k!} \cdot (n\,(n-k-1)\,(n-k-2)\ldots(up\ to\ k\ terms)) \times$$
$$|B|^k (TrB)^{n-2k}$$

and the trace of R_5^n when n is positive odd integer, is given by

$$Tr\ R_5^n$$
$$= \sum\nolimits_{r_1=0}^{\lfloor \frac{n}{3} \rfloor} \left[\sum\nolimits_{r_0=0}^{\lfloor \frac{n-3r_1}{2} \rfloor} \frac{(-1)^{r_0}}{r_0!} [n\,(n-r_0-2r_1-1)\,(n-r_0-2r_1-2)\ldots(n-2r_0-3r_1+1)] \times \right.$$
$$\left. (TrA)^{n-2r_0-3r_1}.A_2^{r_0} \right] \frac{(|A|)^{r_1}}{r_1!} + \sum\nolimits_{k=0}^{\frac{n-1}{2}} \frac{(-1)^k}{k!} \cdot (n\,(n-k-1)\,(n-k-2)\ldots(up\ to\ k\ terms)) \times$$
$$|B|^k (TrB)^{n-2k}$$

where A_2 is the sum of all principal minors of order 2 in A, r_0 is the number of principal minor of order 1, r_1 is the number of principal minors of order 2, $\lfloor x \rfloor$ is the floor function, $|A| = \det A$ and $|B| = \det B$.

Proof. Let $R_5 = \left\langle \begin{array}{ccccc} & & a & & \\ & d & p & b & \\ g & r & e & q & c \\ & h & s & f & \\ & & i & & \end{array} \right\rangle$ be a five dimensional rhotrix whose coupled matrices are

$A = \begin{bmatrix} a & b & c \\ d & e & f \\ g & h & i \end{bmatrix}$ and $B = \begin{bmatrix} p & q \\ r & s \end{bmatrix}$. As stated earlier, $TrR_5 = TrA + TrB$ and $TrR_5^n = TrA^n + TrB^n$. Since of B is a matrix order 2×2, therefore, the trace of B^n can be written directly from the

Theorem 2.1 and the Theorem 2.3. To get the trace of R_5^n, we need to evaluate the trace of A^n. Now, as

$$|A| = a\,(ei - hf) - b\,(di - gf) + +c\,(dh - eg)$$

and $Tr\ A = a + e + i$, therefore,

$$TrA^2 = (a + e + i)^2 - 2\,(ae - bd + ei - fh + ai - cg)$$
$$= (TrA)^2 - 2\sum_{i=1}^{3} |A_{ii}|,$$

where $|A_{ii}|$ are the principal minors of order 2 given as $|A_{11}| = \begin{vmatrix} a & b \\ d & e \end{vmatrix}$, $|A_{22}| = \begin{vmatrix} e & f \\ g & h \end{vmatrix}$, $|A_{33}| = \begin{vmatrix} a & c \\ g & i \end{vmatrix}$.

Therefore, if we put

$$A_2 = \sum_{i=1}^{3} |A_{ii}|$$

then

$$TrA^2 = (TrA)^2 - 2A_2.$$

Also,

$$\begin{aligned} TrA^4 &= a^4 + 2b^2d^2 + e^4 + 2c^2g^2 + 4a^2\,(bd + cg) + 4cdeh + 4e^2fh + 4cfgh \\ &\quad + 2f^2h^2 + cdhi + 4efhi + 4cgi^2 + 4fhi^2 + i^4 + 4a\,(bde + bfg + cdh + cgi) \\ &\quad + 4b\,\left(d\left(e^2 + cg + fh\right) + fg(e + i)\right) \\ &= (a + e + i)^4 - 4(a + e + i)^2\,(-bd + ae - cg - fh + ai + ei) \\ &\qquad + 2(-bd + ae - cg - fh + ai + ei)^2 \\ &\qquad + 4(a + e + i)(-ceg + bfg + cdh - afh - bdi + aei) \\ &= (TrA)^4 - 4\sum_{i=1}^{3} |A_{ii}|.TrA + 2(\sum_{i=1}^{3} |A_{ii}|)^{\ 2} + 4.TrA.\ |A| \\ &= (TrA)^4 - 4A_2.TrA + 2(A_2)^2 + 4.TrA.\ |A|\,. \end{aligned}$$

Similarly,

$$TrA^5 = (TrA)^5 - 5A_2.(TrA)^3 + 5\ TrA.(A_2)^2 + 5\ (TrA)^2.\ |A| - 5.A_2.\,|A|\,.$$

Therefore, TrA^n can be generalized as

$$\begin{aligned} &Tr\ A^n \\ &= \sum\nolimits_{r_1=0}^{\lfloor \frac{n}{3} \rfloor} \left[\sum\nolimits_{r_0=0}^{\lfloor \frac{n-3r_1}{2} \rfloor} \frac{(-1)^{r_0}}{r_0!} \left[n\,(n - r_0 - 2r_1 - 1)\,(n - r_0 - 2r_1 - 2)\ldots(n - 2r_0 - 3r_1 + 1)\right] \times \right. \\ &\left. (TrA)^{n-2r_0-3r_1}.A_2^{r_0} \right] \frac{(|A|)^{r_1}}{r_1!} \end{aligned}$$

For even positive integer n and using Theorem 2.1, we have

$$Tr\ B^n = \sum\nolimits_{k=0}^{\frac{n}{2}} \frac{(-1)^k}{k!} \cdot (n\,(n - k - 1)\,(n - k - 2)\ldots(\text{up to } k \text{ terms})) \cdot |B|^k (TrB)^{n-2k}$$

Therefore, $TrR_5^n = Tr\ A^n + Tr\ B^n$. Now,

$$\begin{aligned} &Tr\ R_5^n \\ &= \sum\nolimits_{r_1=0}^{\lfloor \frac{n}{3} \rfloor} \left[\sum\nolimits_{r_0=0}^{\lfloor \frac{n-3r_1}{2} \rfloor} \frac{(-1)^{r_0}}{r_0!} \left[n\,(n - r_0 - 2r_1 - 1)\,(n - r_0 - 2r_1 - 2)\ldots(n - 2r_0 - 3r_1 + 1)\right] \times \right. \\ &\left. (TrA)^{n-2r_0-3r_1}.A_2^{r_0} \right] \frac{(|A|)^{r_1}}{r_1!} + \sum\nolimits_{k=0}^{\frac{n}{2}} \frac{(-1)^k}{k!} \cdot (n\,(n - k - 1)\,(n - k - 2)\ldots(\text{up to } k \text{ terms})) \times \\ &|B|^k (TrB)^{n-2k} \end{aligned}$$

Also, $R_5^n = Tr\ A^n + Tr\ B^n$, for odd n, this gives

$$Tr\ R_5^n$$
$$= \sum_{r_1=0}^{\lfloor \frac{n}{3} \rfloor} \left[\sum_{r_0=0}^{\lfloor \frac{n-3r_1}{2} \rfloor} \frac{(-1)^{r_0}}{r_0!} \left[n\,(n-r_0-2r_1-1)\,(n-r_0-2r_1-2)\ldots(n-2r_0-3r_1+1) \right] \times \right.$$
$$\left. (TrA)^{n-2r_0-3r_1}.A_2^{r_0} \right] \frac{(|A|)^{r_1}}{r_1!} + \sum_{k=0}^{\frac{n-1}{2}} \frac{(-1)^k}{k!} \cdot (n\,(n-k-1)\,(n-k-2)\ldots(\text{up to } k \text{ terms})) \times$$
$$|B|^k (TrB)^{n-2k}$$

□

4 Trace of a special type of n-dimensional circulant rhotrix

Now we prove below a theorem for the trace of a special type of n-dimensional circulant rhotrix.

Theorem 4.1. *Let $R_n = \langle A_t, B_{t-1} \rangle$ be an $n-$dimensional special circulant rhotrix whose diagonal entries are zero and all other entries are one. A_t, B_{t-1} are the coupled matrices of R_n, where $t = \frac{n+1}{2}, A_t = (a_{ij})$, $1 \leq i,j \leq t$ and $B_{t-1} = (b_{ij})$, $1 \leq i,j \leq t-1$ such that $a_{ij} = \begin{cases} 0, & \text{if } i=j \\ 1, & \text{if } i \neq j \end{cases}$ and $b_{ij} = \begin{cases} 0, & \text{if } i=j \\ 1, & \text{if } i \neq j \end{cases}$. Then, the trace of positive powers of R_n, when r is a positive even integer, is given by*

$$Tr\ R_n^r = \sum_{m=1}^{\frac{r}{2}} N(t,m) t(t-1)^m (t-2)^{r-2m} + \sum_{m=1}^{\frac{r}{2}} N(t-1,m)\,(t-1)\,(t-2)^m (t-3)^{r-2m},$$

and the trace of positive powers of R_n, when r is a positive odd integer, is given by

$$Tr\ R_n^r = \sum_{m=1}^{\frac{r-1}{2}} N(t,m) t(t-1)^m (t-2)^{r-2m} + \sum_{m=1}^{\frac{r-1}{2}} N(t-1,m)\,(t-1)\,(t-2)^m (t-3)^{r-2m},$$

where, $N(k,1) = 1$, $N\left(k, \frac{k}{2}\right) = 1$, $N\left(k, \frac{k-1}{2}\right) = \frac{k-1}{2}$ and $N(k,\ r) = N(k-1,\ r) + N(k-2,\ r-1)$.

Proof. The rhotrix R_n is given by

$$R_n = \left\langle \begin{array}{ccccccc} & & & 0 & & & \\ & & 1 & 0 & 1 & & \\ & & & 1 & 0 & 1 & \ddots \\ 1 & \ldots & 1 & 0 & 1 & \ldots & 1 \\ & & \vdots & \vdots & \vdots & \vdots & \vdots \\ & & & 1 & 0 & 1 & \\ & & & & 0 & & \end{array} \right\rangle$$

whose coupled matrices for $t = \frac{n+1}{2}$ are A_t and B_{t-1} given as below:

$$A_t^2 = (a_{ij}) = \begin{cases} t-1, \text{ if } i=j \\ t-2, \text{ if } i \neq j \end{cases} \quad \text{and} \quad B_{t-1}^2 = (b_{ij}) = \begin{cases} t-2, \text{ if } i=j \\ t-3, \text{ if } i \neq j. \end{cases}$$

Therefore,

$$Tr\ A_t^2 = t(t-1) \ \text{ and } \ Tr\ B_{t-1}^2 = (t-1)\,(t-2)\,. \tag{4.1}$$

That is,

$$Tr\ A_t^2 = \sum_{m=1}^{\frac{r}{2}=1} N\,(2,1)\,t(t-1) \ \text{ and } \ B_{t-1}^2 = \sum_{m=1}^{\frac{r}{2}=1} N\,(2,1)\,(t-1)(t-2).$$

Hence,

$$Tr\ R_n^2 = Tr\ A_t^2 + Tr\ B_{t-1}^2 = \sum_{m=1}^{\frac{r}{2}=1} N(2,m)\, t(t-1) + \sum_{m=1}^{\frac{r}{2}=1} N(2,m)\,(t-1)(t-2).$$

Similarly,

$$A_t^3 = (a_{ij}) = \begin{cases} (t-1)(t-2), \text{ if } i=j \\ (t-1)+(t-2)^2, \text{ if } i\neq j \end{cases} \quad \text{and} \quad B_{t-1}^3 = (b_{ij}) = \begin{cases} (t-2)(t-3), \text{ if } i=j \\ (t-2)+(t-3)^2, \text{ if } i\neq j, \end{cases}$$

which gives,

$$Tr\ A_t^3 = t(t-1)(t-2) \ \text{ and } \ Tr\ B_{t-1}^3 = (t-1)\,(t-2)\,(t-3). \tag{4.2}$$

That is,

$$TrA_t^3 = \sum\nolimits_{m=1}^{\frac{r-1}{2}=1} N(3,m)\, t(t-1)(t-2) \quad \text{and} \quad TrB_{t-1}^3 = \sum\nolimits_{m=1}^{\frac{r-1}{2}=1} N(3,m)\,(t-1)(t-2)(t-3),$$

which gives,

$$Tr\ R_n^3 = Tr\ A_t^3 + Tr\ B_{t-1}^3 \ = \sum_{m=1}^{\frac{r-1}{2}=1} N(3,m)\, t(t-1)(t-2) + \sum_{m=1}^{\frac{r-1}{2}=1} N(3,m)\,(t-1)(t-2)(t-3).$$

Now,

$$A_t^4 = (a_{ij}) = \begin{cases} (t-1)\ \ [(t-1)+(t-2)^2], \ \text{ if } \ i=j \\ (t-1)\,(t-2)+(t-2)\,[(t-1)+(t-2)^2], \ \text{ if } \ i\neq j \end{cases}$$

and

$$B_{t-1}^4 = (b_{ij}) = \begin{cases} (t-2)\ \ [(t-2)+(t-3)^2], \ \text{ if } \ i=j \\ (t-2)\,(t-3)+(t-3)\,[(t-2)+(t-3)^2], \ \text{ if } \ i\neq j \end{cases}$$

which lends

$$Tr\ A_t^4 = t(t-1)^2 + t(t-1)(t-2)^2 \quad \text{and} \quad Tr\ B_{t-1}^4 = (t-1)(t-2)^2 + (t-1)(t-2)(t-3)^2. \tag{4.3}$$

That is,

$$TrA_t^4 = \sum_{m=1}^{\frac{r}{2}=2} N(4,m)\, t(t-1)^m (t-2)^{4-2m} \quad \text{and} \quad TrB_t^4 = \sum_{m=1}^{\frac{r}{2}=2} N(4,m)\,(t-1)\,(t-2)^m (t-3)^{4-2m}$$

which gives,

$$Tr\ R_n^4 = Tr\ A_t^4 + Tr\ B_{t-1}^4 \ = \sum_{m=1}^{\frac{r}{2}=2} N(4,m)\, t(t-1)^m (t-2)^{4-2m} + \sum_{m=1}^{\frac{r}{2}=2} N(4,m)\,(t-1)(t-2)^m (t-3)^{4-2m}.$$

Now,

$$A_t^5 = (a_{ij}) = \begin{cases} 2(t-1)^2\,(t-2) + (t-1)(t-2)^3, \ \text{ if } \ i=j \\ (t-1)^2 + 3\,(t-1)\,(t-2)^2 + (t-2)^4], \ \text{ if } \ i\neq j \end{cases}$$

and

$$B_{t-1}^5 = (b_{ij}) = \begin{cases} 2(t-2)^2\,(t-3) + (t-2)(t-3)^3, \ \text{ if } \ i=j \\ (t-2)^2 + 3\,(t-2)\,(t-3)^2 + (t-3)^4], \ \text{ if } \ i\neq j, \end{cases}$$

which gives,

$$Tr\ A_t^5 = 2t(t-1)^2(t-2) + t(t-1)(t-2)^3 \quad \text{and} \quad Tr\ B_{t-1}^5 = 2\,(t-1)\,(t-2)^2\,(t-3) + (t-1)(t-2)(t-3)^3. \tag{4.4}$$

That is,

$$TrA_t^5 = \sum_{m=1}^{\frac{r}{2}=2} N(5,m)\, t(t-1)^m (t-2)^{5-2m} \quad \text{and} \quad TrB_{t-1}^5 = \sum_{m=1}^{\frac{r}{2}=2} N(5,m)\,(t-1)(t-2)^m (t-3)^{5-2m}$$

from where follows that

$$Tr\ R_n^5 = Tr\ A_t^5 + Tr\ B_{t-1}^5 = \sum_{m=1}^{\frac{r}{2}=2} N\,(5,m)\,t(t-1)^m(t-2)^{5-2m} + \sum_{m=1}^{\frac{r}{2}=2} N\,(5,m)\,(t-1)(t-2)^m(t-3)^{5-2m}.$$

Thus, by induction, we conclude that

$$Tr\ R_n^r = \sum_{m=1}^{\frac{r}{2}} N(t,m)t(t-1)^m(t-2)^{r-2m} + \sum_{m=1}^{\frac{r}{2}} N(t-1,m)\,(t-1)\,(t-\ \ 2)^m(t-3)^{r-2m}$$

where, r is a positive even integer and

$$Tr\ R_n^r = \sum_{m=1}^{\frac{r-1}{2}} N(t,m)t(t-1)^m(t-2)^{r-2m} + \sum_{m=1}^{\frac{r-1}{2}} N(t-1,m)\,(t-1)\,(t-2)^m(t-3)^{r-2m}$$

where, r is a positive odd integer.

□

5 Conclusion

In this paper, we find the trace of positive integral powers of three and five dimensional rhotrices. Also, a result to find the traces of positive integral power of a special type of circulant rhotrix is derived.

Acknowledgments The authors thankfully acknowledge the support of the UGC-SAP and they also sincerely express their gratitude to the Editor-in-Chief of this Journal and the referees for their valuable suggestions for modifying this paper.

Abstract Matrices play an important role in various branches of mathematics such as coding theory, combinatorics and cryptography. Rhotrices are represented by coupled matrices. The use of rhotrices in cryptography doubles the security of messages which travel over insecure channels. We consider rhotrices of 3-dimension and derive some properties related to their characteristic roots. Further, we take a special class of rhotrices of n-dimension and discuss its properties.

Key words Rhotrix, Finite field, Coupled matrix, Eigen values.

2020 Mathematics Subject Classification 15A09, 20H30, 11T71.

1 Introduction

The concept of rhotrix was introduced by Ajibade [2] in 2003. A rhotrix is defined as a mathematical array, which is in some way, between (2×2)-dimension

$$\begin{bmatrix} a & b \\ c & d \end{bmatrix}$$

and (3×3)-dimension

$$\begin{bmatrix} a & b & c \\ d & e & f \\ g & h & i \end{bmatrix}$$

matrices. The rhotrix of dimension three is defined by

$$R_3 = \left\{ \left\langle \begin{array}{ccc} & a & \\ b & c & d \\ & e & \end{array} \right\rangle : a,\ b,\ c,\ d,\ e \in \Re \right\} \tag{1.1}$$

* Communicated, edited and typeset in Latex by *Lalit Mohan Upadhyaya* (Editor-in-Chief).

†Corresponding author P.L. Sharma, E-mail: plsharma1964@gmail.com

Here, $h(R_3)= c$ is the heart of rhotrix and all the entries of rhotrix are real numbers. Ajibade [2] also discussed the following operations of addition and scalar multiplication.

Let $R_5 = \left\langle \begin{array}{ccccc} & & a & & \\ & b & c & d & \\ e & f & h(R_5) & h & i \\ & j & k & l & \\ & & m & & \end{array} \right\rangle$ and $Q_5 = \left\langle \begin{array}{ccccc} & & n & & \\ & o & p & q & \\ r & s & h(Q_5) & u & v \\ & w & x & y & \\ & & z & & \end{array} \right\rangle$ be 5-dimensional rhotrices,

then the addition of these rhotrices is defined as

$$R_5 + Q_5 = \left\langle \begin{array}{ccccc} & & a & & \\ & b & c & d & \\ e & f & h(R_5) & h & i \\ & j & k & l & \\ & & m & & \end{array} \right\rangle + \left\langle \begin{array}{ccccc} & & n & & \\ & o & p & q & \\ r & s & h(Q_5) & u & v \\ & w & x & y & \\ & & z & & \end{array} \right\rangle$$

$$= \left\langle \begin{array}{ccccc} & & a+n & & \\ & b+o & c+p & d+q & \\ e+r & f+s & h(R_5)+h(Q_5) & h+u & i+v \\ & j+w & k+x & l+y & \\ & & m+z & & \end{array} \right\rangle. \tag{1.2}$$

The scalar multiplication $\alpha\, R_5$ for the real scalar α is defined as

$$\alpha\, R_5 = \alpha \left\langle \begin{array}{ccccc} & & a & & \\ & b & c & d & \\ e & f & h(R_5) & h & i \\ & j & k & l & \\ & & m & & \end{array} \right\rangle = \left\langle \begin{array}{ccccc} & & \alpha a & & \\ & \alpha b & \alpha c & \alpha d & \\ \alpha e & \alpha f & \alpha h(R_5) & \alpha h & \alpha i \\ & \alpha j & \alpha k & \alpha l & \\ & & \alpha m & & \end{array} \right\rangle. \tag{1.3}$$

The row-column multiplication of rhotrices is discussed in [6] as follows:

For $R_3 = \left\langle \begin{array}{ccc} & a & \\ b & c & d \\ & e & \end{array} \right\rangle$ and $Q_3 = \left\langle \begin{array}{ccc} & f & \\ g & h & j \\ & k & \end{array} \right\rangle$,

$$R_3\, o\, Q_3 = \left\langle \begin{array}{ccc} & a & \\ b & c & d \\ & e & \end{array} \right\rangle \left\langle \begin{array}{ccc} & f & \\ g & h & j \\ & k & \end{array} \right\rangle = \left\langle \begin{array}{ccc} & af+dg & \\ bf+eg & ch & aj+dk \\ & bj+ek & \end{array} \right\rangle.$$

A method of converting a rhotrix to a coupled matrix is discussed in [8]. Various problems involving the $m \times m$ and the $(m-1) \times (m-1)$ matrices can be easily solved by coupled matrix simultaneously, see [4, 15]. The heart-oriented multiplication is discussed in [1, 5].

The row-column multiplication of n-dimensional rhotrices is discussed by Sani [7]. The rhotrix of n-dimension is given by

$$R_n = \left\langle \begin{array}{ccccccccc} & & & & a_{11} & & & & \\ & & & a_{21} & c_{11} & a_{12} & & & \\ & & a_{31} & c_{21} & a_{22} & c_{12} & a_{13} & & \\ & & .. & .. & .. & .. & .. & & \\ & & .. & .. & .. & .. & .. & & \\ & & .. & .. & .. & .. & .. & & \\ a_{n1} & & a_{n\,n-2} & c_{n-1\,n-2} & a_{n-1\,n-1} & c_{n-2\,n-1} & a_{n-2\,n} & & a_{1n} \\ & & & a_{n\,n-1} & c_{n-1\,n-1} & a_{n-1\,n} & & & \\ & & & & a_{nn} & & & & \end{array} \right\rangle = \langle a_{ij},\, c_{lk} \rangle\,,$$

The total number of elements in R_n (n is always an odd number ≥ 3) is given by $|R_n| = \frac{n^2+1}{2}$, where $R_n = \langle a_{ij},\, c_{lk} \rangle$is the coupled matrix with $i,\, j = 1,\ 2,\ ...,t;\ l,\ k = 1,\ 2,\ ...,t-1$ for $t = \frac{n+1}{2}$.

Further, for two coupled rhotrices $R_n{=}\langle a_{i_1j_1},\ c_{l_1k_1}\rangle$ and $Q_n{=}\langle b_{i_2j_2},\ d_{l_2k_2}\rangle$, the multiplication is defined as

$$R_n\, o\, Q_n = \langle a_{i_1j_1},\ c_{l_1k_1}\rangle\ o\ \langle b_{i_2j_2},\ d_{l_2k_2}\rangle = \left\langle \sum_{i_2j_1=1}^{t} (a_{i_1j_1}\, b_{i_2j_2})\ ,\ \sum_{l_2k_1=1}^{t-1} (c_{l_1k_1}\, d_{l_2k_2}) \right\rangle. \tag{1.4}$$

The inverse of the rhotrix

$$R_3 = \left\langle \begin{array}{ccc} & a & \\ b & e & d \\ & c & \end{array} \right\rangle$$

is defined as

$$R_3^{-1} = \left\langle \begin{array}{ccc} & \frac{c}{ac-bd} & \\ -\frac{b}{bd-ac} & \frac{1}{e} & -\frac{d}{bd-ac} \\ & \frac{a}{ac-bd} & \end{array} \right\rangle. \tag{1.5}$$

Matrices are important in cryptography. Some cryptosystems are based on matrices, such as Hill cipher, see [3]. The rhotrices are represented as coupled matrices. Therefore, the use of rhotrix in cryptography means the use of the double matrices which increase the security of the cipher. The properties of rhotrices are discussed in [9–14, 16].
We discuss some properties of rhotrices $R_n = \langle a_{ij},\ c_{lk}\rangle$ over a finite field $\mathbb{F}_2$ which satisfies the following condition:

$$\mathbf{P}\ : \alpha_{ij} = \begin{cases} 1 & \text{if } i+j = \text{even}, \\ 0 & \text{if } i+j = \text{odd}. \end{cases} \tag{1.6}$$

2 The main results

Theorem 2.1. *Let R be a rhotrix of 3-dimension which satisfies the condition* $\mathbf{P}$ *of (1.6) and $\lambda_1,\ \lambda_2,\ \lambda_3$ be the characteristic roots of R. Then $\lambda_1^2,\ \lambda_2^2,\ \lambda_3^2$ are the characteristic roots of R^2 over the finite field $\mathbb{F}_2$.*

Proof. Let

$$R = \left\langle \begin{array}{ccc} & a_{11} & \\ 0 & c_{11} & 0 \\ & a_{22} & \end{array} \right\rangle \tag{2.1}$$

be the rhotrix satisfying the condition $\mathbf{P}$ of (1.6). Now, the characteristic roots of R are given by

$$|R - \lambda I| = 0,$$

That is,

$$\begin{vmatrix} & a_{11}-\lambda & \\ 0 & c_{11}-\lambda & 0 \\ & a_{22}-\lambda & \end{vmatrix} = 0.$$

This gives

$$\lambda^3 + (a_{11}+a_{22}+c_{11})\,\lambda^2 + (a_{11}c_{11}+a_{22}c_{11}+a_{22}a_{11})\,\lambda + (a_{11}a_{22}c_{11}) = 0. \tag{2.2}$$

Since, $\lambda_1, \lambda_2, \lambda_3$ are the characteristic roots of R, therefore, there exists a non-zero vector X such that

$$RX = \lambda X,$$

where, $X = (x_1, x_2, x_3)$ is a non-zero vector corresponding to the characteristic roots $\lambda_1, \lambda_2, \lambda_3$.
Thus, we get

$$\left\langle \begin{array}{ccc} & a_{11} & \\ 0 & c_{11} & 0 \\ & a_{22} & \end{array} \right\rangle \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} \lambda_1 \\ \lambda_2 \\ \lambda_3 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} \tag{2.3}$$

Multiplying both sides by R, we get

$$\left\langle \begin{array}{ccc} & a_{11} & \\ 0 & c_{11} & 0 \\ & a_{22} & \end{array} \right\rangle \left\langle \begin{array}{ccc} & a_{11} & \\ 0 & c_{11} & 0 \\ & a_{22} & \end{array} \right\rangle \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \left\langle \begin{array}{ccc} & a_{11} & \\ 0 & c_{11} & 0 \\ & a_{22} & \end{array} \right\rangle \begin{bmatrix} \lambda_1 \\ \lambda_2 \\ \lambda_3 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix},$$

that is,

$$\left\langle \begin{array}{ccc} & a_{11}a_{11} & \\ 0 & c_{11}c_{11} & 0 \\ & a_{22}a_{22} & \end{array} \right\rangle \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \left\langle \begin{array}{ccc} & a_{11} & \\ 0 & c_{11} & 0 \\ & a_{22} & \end{array} \right\rangle \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} \begin{bmatrix} \lambda_1 \\ \lambda_2 \\ \lambda_3 \end{bmatrix} \tag{2.4}$$

Using (2.3) in (2.4), we get

$$\left\langle \begin{array}{ccc} & a_{11}a_{11} & \\ 0 & c_{11}c_{11} & 0 \\ & a_{22}a_{22} & \end{array} \right\rangle \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} \lambda_1 \\ \lambda_2 \\ \lambda_3 \end{bmatrix} \left(\begin{bmatrix} \lambda_1 \\ \lambda_2 \\ \lambda_3 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} \right),$$

$$= \left(\begin{bmatrix} \lambda_1 \\ \lambda_2 \\ \lambda_3 \end{bmatrix} \right)^2 \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix},$$

$$= \left(\begin{bmatrix} \lambda_1^2 \\ \lambda_2^2 \\ \lambda_3^2 \end{bmatrix} \right) \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix}. \tag{2.5}$$

Since, $x = (x_1, x_2, x_3)$ is a non-zero vector, therefore, it is clear from the above equation that $\lambda_1^2, \lambda_2^2, \lambda_3^2$ are the characteristic roots of the rhotrix R^2. □

Theorem 2.2. *Let R be a rhotrix of 3-dimension satisfying the condition* **P** *of (1.6). Then there exists an invertible rhotrix S, such that $S^{-1}RS$ and R have the same characteristic roots (eigenvalues).*

Proof. Let the rhotrix be

$$R = \left\langle \begin{array}{ccc} & a_{11} & \\ 0 & c_{11} & 0 \\ & a_{22} & \end{array} \right\rangle.$$

Let $\lambda_1,\ \lambda_2,\ \lambda_3$ be its characteristic roots. Therefore,

$$\lambda^3 + (a_{11} + a_{22} + c_{11})\lambda^2 + (a_{11}c_{11} + a_{22}c_{11} + a_{22}a_{11})\lambda + (a_{11}a_{22}c_{11}) = 0.$$

Let the rhotrix

$$S = \left\langle \begin{array}{ccc} & b_{11} & \\ 0 & d_{11} & 0 \\ & b_{22} & \end{array} \right\rangle$$

be non-singular.
Therefore, the inverse of S rhotrix is given by

$$S^{-1} = \left\langle \begin{array}{ccc} & \frac{1}{b_{11}} & \\ 0 & \frac{1}{d_{11}} & 0 \\ & \frac{1}{b_{22}} & \end{array} \right\rangle. \tag{2.6}$$

Now,

$$S^{-1}RS = \left\langle \begin{array}{ccc} & \frac{1}{b_{11}} & \\ 0 & \frac{1}{d_{11}} & 0 \\ & \frac{1}{b_{22}} & \end{array} \right\rangle \left\langle \begin{array}{ccc} & a_{11} & \\ 0 & c_{11} & 0 \\ & a_{22} & \end{array} \right\rangle \left\langle \begin{array}{ccc} & b_{11} & \\ 0 & d_{11} & 0 \\ & b_{22} & \end{array} \right\rangle,$$

$$= \left\langle \begin{array}{ccc} & \frac{1}{b_{11}} & \\ 0 & \frac{1}{d_{11}} & 0 \\ & \frac{1}{b_{22}} & \end{array} \right\rangle \left\langle \begin{array}{ccc} & a_{11}b_{11} & \\ 0 & c_{11}d_{11} & 0 \\ & a_{22}b_{22} & \end{array} \right\rangle,$$

$$= \left\langle \begin{array}{ccc} & a_{11} & \\ 0 & c_{11} & 0 \\ & a_{22} & \end{array} \right\rangle. \tag{2.7}$$

Therefore, the characteristic equation of $S^{-1}RS$ is given by

$$\left| S^{-1}RS - \lambda \right| = 0,$$

i.e.,

$$\begin{vmatrix} & a_{11}-\lambda & \\ 0 & c_{11}-\lambda & 0 \\ & a_{22}-\lambda & \end{vmatrix} = 0,$$

which gives

$$\lambda^3 + (a_{11}+a_{22}+c_{11})\lambda^2 + (a_{11}c_{11}+a_{22}c_{11}+a_{22}a_{11})\lambda + (a_{11}a_{22}c_{11}) = 0. \tag{2.8}$$

It is clear from (2.2) and (2.8) that the characteristic roots of R and $S^{-1}RS$ are the same. □

Theorem 2.3. *Let R be a rhotrix of 3-dimension satisfying the condition* **P** *of (1.6). Also $\lambda = \{\lambda_1, \lambda_2, \lambda_3\}$ be the set of characteristic roots of the rhotrix R over the finite field $\mathbb{F}_2$. Then $\frac{|R|}{\lambda_i}$ (for some $i = 1, 2, 3$) is the characteristic root of the rhotrix R.*

Proof. Let $\lambda = \{\lambda_1, \lambda_2, \lambda_3\}$ be the set of characteristic roots of rhotrix

$$R = \left\langle \begin{array}{ccc} & a_{11} & \\ 0 & c_{11} & 0 \\ & a_{22} & \end{array} \right\rangle.$$

The determinant of the rhotrix R is given by

$$|R| = \begin{vmatrix} & a_{11} & \\ 0 & c_{11} & 0 \\ & a_{22} & \end{vmatrix}$$

$$= (a_{11}a_{22}c_{11}) \tag{2.9}$$

Therefore,

$$\frac{|R|}{\lambda_i} = \frac{(a_{11}a_{22}c_{11})}{\lambda_i}. \tag{2.10}$$

Since c_{11} is one of the characteristic roots of R among $\{\lambda_1, \lambda_2, \lambda_3\}$, thus taking $\lambda_i = c_{11}$ and putting in (2.10), we get

$$\frac{|R|}{\lambda_i} = \frac{(a_{11}a_{22}c_{11})}{c_{11}}$$

$$= a_{11}a_{22}. \tag{2.11}$$

Putting the value of $\frac{|R|}{\lambda_i}$ from (2.11) in the characteristic equation of R given in (2.2), we get

$$(a_{11}a_{22})^3 + (a_{11}+a_{22}+c_{11})(a_{11}a_{22})^2 + (a_{11}c_{11}+a_{22}c_{11}+a_{22}a_{11})(a_{11}a_{22}) + (a_{11}a_{22}c_{11}) = 0. \tag{2.12}$$

Therefore, it is clear from (2.12) that $\frac{|R|}{\lambda_i}$ satisfies the equation (2.2). This implies that $\frac{|R|}{\lambda_i}$ is the characteristic root of R. □

Theorem 2.4. *Let R_n be a rhotrix over finite field $\mathbb{F}_2$, satisfying the condition* **P** *of (1.6). Then,* $\mathrm{H}(R_n^2) = 1$.

Proof. Let the rhotrix R_n be given by

$$R_n = \left\langle \begin{array}{ccccccc} & & & & a_{11} & & \\ & & & a_{21} & c_{11} & & \\ & & a_{31} & c_{21} & a_{22} & & \\ & \cdots & \cdots & \cdots & \cdots & & \\ & a_{(n-1)1} & \cdots & \cdots & \cdots & \sum a_{\frac{(n-1)}{2}\ \frac{(n-1)}{2}} & \\ a_{n1} & c_{(n-1)1} & \cdots & \cdots & \sum a_{\frac{(n+1)}{2}\ \frac{(n-1)}{2}} & \sum c_{\frac{(n-1)}{2}\ \frac{(n-1)}{2}} & \\ & a_{n2} & \cdots & \cdots & \cdots & \sum a_{\frac{(n+1)}{2}\ \frac{(n+1)}{2}} & \\ & \cdots & \cdots & \cdots & \cdots & \cdots & \\ & & a_{n(n-2)} & c_{n(n-1)} & a_{(n-1)(n-1)} & & \\ & & & a_{n(n-1)} & c_{(n-1)(n-1)} & & \\ & & & & a_{nn} & & \end{array} \right\rangle$$

$$\left\langle \begin{matrix} a_{12} \\ c_{12} \\ \cdots \\ \cdots \\ \sum a_{\frac{(n-1)}{2}\ \frac{(n+1)}{2}} \\ \cdots \\ \cdots \\ c_{(n-1)n} \\ a_{(n-1)n} \end{matrix} \quad \begin{matrix} a_{13} \\ \cdots \\ \cdots \\ \cdots \\ \cdots \\ \cdots \\ a_{(n-2)n} \end{matrix} \quad \begin{matrix} \cdots \\ \cdots \\ \cdots \\ \cdots \\ \cdots \end{matrix} \quad \begin{matrix} a_{1(n-1)} \\ c_{1(n-1)} \\ a_{2n} \end{matrix} \quad a_{1n} \right\rangle .$$

Since the rhotrix R_n satisfies the condition **P** of (1.6), therefore R_n becomes

$$R_n = \left\langle \begin{matrix} & & & & & 1 & & & & \\ & & & 0 & & 1 & & 0 & & \\ & & 1 & 0 & & 1 & & 0 & 1 & \\ \cdots & \cdots & \cdots & \cdots & & \cdots & & \cdots & \cdots & \cdots \\ 0 & \cdots & \cdots & \cdots & & \sum a_{\frac{(n-1)}{2}\ \frac{(n-1)}{2}} & & \cdots & \cdots & \cdots & 0 \\ 0 & \cdots & \cdots & 0 & & \sum c_{\frac{(n-1)}{2}\ \frac{(n-1)}{2}} & & 0 & \cdots & \cdots & 0 \\ 0 & \cdots & \cdots & \cdots & & \sum a_{\frac{(n+1)}{2}\ \frac{(n+1)}{2}} & & \cdots & \cdots & \cdots & 0 \\ \cdots & \cdots & \cdots & \cdots & & \cdots & & \cdots & \cdots & \cdots & \\ & a_{n(n-2)} & & 0 & & a_{(n-1)(n-1)} & & 0 & a_{(n-2)n} & & \\ & & & 0 & & c_{(n-1)(n-1)} & & 0 & & & \\ & & & & & a_{nn} & & & & & \end{matrix} \right\rangle \quad a_{n1} \quad a_{1n} \quad , \qquad (2.13)$$

where $a_{11}, c_{11}, a_{21}, a_{12}, c_{21}, c_{21}, \ldots, c_{(n-1)(n-1)}, a_{nn} \in \mathbb{F}_2$ and $c_{\frac{(n-1)}{2}\ \frac{(n-1)}{2}}$ is the heart of the rhotrix R_n, that is, $H(R_n)$.
Since, $R_n^2 = R_n R_n$, therefore,

$$R_n^2 = \left\langle \begin{matrix} & & & & & & & & & & \sum_{i,j=1}^{n} a_{ij}a_{ji} \\ & & & & & & & & & 0 & \sum_{i,j=1}^{n} c_{ij}c_{ji} \\ & & & & & & & \sum_{i=3,j=1}^{n} a_{ij}a_{ji} & & 0 & \sum_{i,j=2}^{n} a_{ij}a_{ji} \\ & & & & & & 0 & \sum_{i=3,j=1}^{n} c_{ij}c_{ji} & & 0 & \sum_{i,j=2}^{n} c_{ij}c_{ji} \\ & & & & & & \cdots & \cdots & & \cdots & \cdots \\ & & & & & \cdots & \cdots & \cdots & & \cdots & \cdots \\ & & & & \cdots & \cdots & \cdots & \cdots & & \cdots & \cdots \\ 0 & \cdots & \cdots & \cdots & \cdots & \cdots & & \cdots & & \cdots & \sum_{i,j=1}^{n} a_{\frac{(n-1)}{2}\ i}\, a_{j\ \frac{(n-1)}{2}} \\ 0 & \cdots & \cdots & \cdots & \cdots & \cdots & & \cdots & & 0 & \sum_{i,j=1}^{n} c_{\frac{(n-1)}{2}\ i}\, c_{j\ \frac{(n-1)}{2}} \\ 0 & & \cdots & \cdots & \cdots & \cdots & & \cdots & & \cdots & \sum_{i,j=1}^{n} a_{\frac{(n+1)}{2}\ i}\, a_{j\ \frac{(n+1)}{2}} \\ & & & & \cdots & \cdots & & \cdots & & \cdots & \cdots \\ & & & & & \cdots & & \cdots & & \cdots & \cdots \\ & & & & & 0 & & \cdots & & \cdots & \cdots \\ & & & & & & & \cdots & & \cdots & \cdots \\ & & & & & & \sum_{i=n}^{n}\sum_{j=3}^{n} a_{ij}a_{(j-2)i} & & 0 & \sum_{i,j=3}^{n} a_{(i-1)j}a_{(j-1)i} \\ & & & & & & & & 0 & \sum_{i,j=2}^{n} c_{(i-1)j}c_{(j-1)i} \\ & & & & & & & & & \sum_{i=1}^{n} a_{ii}a_{ii} \end{matrix} \right\rangle$$

$$
\begin{array}{ccccccccccccc}
0 & & & & & & & & & & & & \\
0 & \sum\limits_{i=1,j=3}^{n} a_{ij}a_{ji} & & & & & & & & & & & \\
0 & \sum\limits_{i=1,j=3}^{n} c_{ij}c_{ji} & 0 & & & & & & & & & & \\
\cdots & \cdots & \cdots & \cdots & & & & & & & & & \\
\cdots & \cdots & \cdots & \cdots & \cdots & & & & & & & & \\
\cdots & \cdots & \cdots & \cdots & \cdots & \cdots & & & & & & & \\
\cdots & \cdots & \cdots & \cdots & \cdots & \cdots & \cdots & \cdots & 0 & & & & \\
0 & \cdots & \cdots & \cdots & \cdots & \cdots & \cdots & \cdots & 0 & \sum\limits_{j=n}^{n}\sum\limits_{i=1}^{n} a_{ij}a_{ji} & \Big\rangle & & \\
\cdots & \cdots & \cdots & \cdots & \cdots & \cdots & \cdots & \cdots & 0 & & & & \\
\cdots & \cdots & \cdots & \cdots & \cdots & \cdots & \cdots & & & & & & \\
\cdots & \cdots & \cdots & \cdots & \cdots & & & & & & & & \\
\cdots & \cdots & \cdots & \cdots & & & & & & & & & \\
\cdots & \cdots & 0 & & & & & & & & & & \\
0 & \sum\limits_{j=n}^{n}\sum\limits_{i=3}^{n} a_{(i-2)j}a_{ji} & & & & & & & & & & & \\
0 & & & & & & & & & & & &
\end{array}
\tag{2.14}
$$

Obviously, the heart of the rhotrix R_n^2 is

$$
H\left(R_n^2\right) = \sum_{i,j=1}^{n} c_{\frac{(n-1)}{2}\,i}\, c_{j\,\frac{(n-1)}{2}}\,, \tag{2.15}
$$

where $\frac{(n-1)}{2}$ is always even.
Therefore,

$$
\begin{aligned}
\sum_{i,j=1}^{n} c_{\frac{(n-1)}{2}\,i}\, c_{j\,\frac{(n-1)}{2}} &= c_{1i}c_{j1} + c_{2i}c_{j2} + c_{3i}c_{j3} + \ .\ .\ .\ + c_{\frac{(n-1)}{2}\,i}\, c_{j\,\frac{(n-1)}{2}}\,, \\
&= c_{11}c_{11} + c_{13}c_{31} + c_{15}c_{51} + c_{21}c_{12} + \ .\ .\ .\ + c_{\frac{(n-1)}{2}\,n}\, c_{n\,\frac{(n-1)}{2}}\,.
\end{aligned} \tag{2.16}
$$

By using the condition **P** of (1.6) in (2.16) the terms like $c_{12}c_{21}$ become zero. Similarly, all the terms with $i+j =$ an odd number are zero and only the terms for which $i+j =$ an even number survive. Since these terms are always odd in number, therefore, it is clear form (2.16) that sum of all these terms is equal to 1 over the finite field $\mathbb{F}_2$. Hence, we conclude that heart of rhotrix R_n^2 is always equal to 1. □

Theorem 2.5. *Let R_n be a rhotrix satisfying the condition* **P** *of* (1.6). *Then, there exist a sub-rhotrix*

$$
\begin{cases}
\left\langle \begin{array}{ccc} & 0 & \\ 0 & 1 & 0 \\ & 0 & \end{array} \right\rangle, \text{ for } n = 4k_1 \pm 1, \text{ where } k_1 \text{ is an even number,} \\
\left\langle \begin{array}{ccc} & 1 & \\ 0 & 1 & 0 \\ & 1 & \end{array} \right\rangle, \text{ for } n = 4k_2 \pm 1, \text{ where } k_2 \text{ is an odd number,}
\end{cases} \tag{2.17}
$$

of R_n^2 over the finite field $\mathbb{F}_2$.

Proof. Let the rhotrix R_n be

$$R_n = \left\langle \begin{array}{ccccccccccccc} & & & & & & 1 & & & & & & \\ & & & & & 0 & 1 & 0 & & & & & \\ & & & & 1 & 0 & 1 & 0 & 1 & & & & \\ & & .. & & .. & .. & .. & .. & .. & .. & & & \\ & 0 & .. & & .. & .. & .. & .. & .. & .. & 0 & & \\ a_{n1} & 0 & .. & & .. & .. & .. & .. & .. & .. & 0 & a_{1n} & \\ & 0 & .. & & .. & .. & .. & .. & .. & .. & 0 & & \\ & & .. & & .. & .. & .. & .. & .. & & & & \\ & & & a_{n(n-2)} & 0 & a_{(n-1)(n-1)} & 0 & a_{(n-2)n} & & & & & \\ & & & & 0 & c_{(n-1)(n-1)} & 0 & & & & & & \\ & & & & & a_{nn} & & & & & & & \end{array} \right\rangle,$$

Since, $R_n^2 = R_n R_n$, therefore,

$$R_n^2 = \left\langle \begin{array}{ccccccccccccc} & & & & & & & & & & & & \sum_{i,j=1}^{n} a_{ij}a_{ji} \\ & & & & & & & & & & & & \sum_{i,j=1}^{n} c_{ij}c_{ji} \\ & & & & & & & \sum_{i=3,j=1}^{n} a_{ij}a_{ji} & & & 0 & & \sum_{i,j=2}^{n} a_{ij}a_{ji} \\ & & & & & & 0 & \sum_{i=3,j=1}^{n} c_{ij}c_{ji} & & & 0 & & \sum_{i,j=2}^{n} c_{ij}c_{ji} \\ & & & & & & \cdots & \cdots & & & \cdots & & \cdots \\ & & & & & \cdots & \cdots & \cdots & & & \cdots & & \cdots \\ & & & & \cdots & \cdots & \cdots & \cdots & & & \cdots & & \sum_{i,j=1}^{n} c_{\frac{(n-3)}{2}\,i}\, c_{j\,\frac{(n-3)}{2}} \\ & & 0 & \cdots & \cdots & \cdots & \cdots & \cdots & & & \cdots & & 0 & & \sum_{i,j=1}^{n} a_{\frac{(n-1)}{2}\,i}\, a_{j\,\frac{(n-1)}{2}} \\ \sum_{i=n}\sum_{j=1}^{n} a_{ij}a_{ji} & & 0 & \cdots & \cdots & \cdots & \cdots & \cdots & \sum_{i,j=1}^{n} c_{\frac{(n+1)}{2}\,i}\, c_{j\,\frac{(n-3)}{2}} & & & & 0 & & \sum_{i,j=1}^{n} c_{\frac{(n-1)}{2}\,i}\, c_{j\,\frac{(n-1)}{2}} \\ & & 0 & & \cdots & \cdots & \cdots & \cdots & & & \cdots & & 0 & & \sum_{i,j=1}^{n} a_{\frac{(n+1)}{2}\,i}\, a_{j\,\frac{(n+1)}{2}} \\ & & & & & & \cdots & \cdots & & & \cdots & & \cdots & & \sum_{i,j=1}^{n} c_{\frac{(n+1)}{2}\,i}\, c_{j\,\frac{(n+1)}{2}} \\ & & & & & & \cdots & \cdots & & & \cdots & & \cdots & & \cdots \\ & & & & & & \cdots & \cdots & & & \cdots & & \cdots & & \cdots \\ & & & & & & & \cdots & & & \cdots & & \cdots & & \cdots \\ & & & & & & & \sum_{i=n}\sum_{j=3}^{n} a_{ij}a_{(j-2)i} & & & 0 & & \sum_{i,j=2}^{n} a_{(i-1)j}a_{(j-1)i} \\ & & & & & & & & & & 0 & & \sum_{i,j=2}^{n} c_{(i-1)j}c_{(j-1)i} \\ & & & & & & & & & & & & \sum_{i=1}^{n} a_{ii}a_{ii} \end{array} \right\rangle$$

$$\begin{array}{cccccccccccc}
0 & & & & & & & & & & & \\
0 & \sum_{i=1,j=3}^{n} a_{ij}a_{ji} & & & & & & & & & & \\
0 & \sum_{i=1,j=3}^{n} a_{ij}a_{ji} & 0 & & & & & & & & & \\
\cdots & \cdots & \cdots & \cdots & & & & & & & & \\
\cdots & \cdots & \cdots & \cdots & \cdots & & & & & & & \\
\cdots & \cdots & \cdots & \cdots & \cdots & \cdots & & & & & & \\
0 & \cdots & \cdots & \cdots & \cdots & \cdots & \cdots & \cdots & 0 & & & \\
0 & \sum_{i,j=1}^{n} a_{\frac{(n-3)}{2}i}a_{j\frac{(n+1)}{2}} & \cdots & \cdots & \cdots & \cdots & \cdots & \cdots & 0 & \sum_{j=n}^{n}\sum_{i=1}^{n} a_{ij}a_{ji} & & \\
0 & \cdots & \cdots & \cdots & \cdots & \cdots & \cdots & \cdots & 0 & & & \\
\cdots & \cdots & \cdots & \cdots & \cdots & \cdots & \cdots & & & & & \\
\cdots & \cdots & \cdots & \cdots & \cdots & & & & & & & \\
\cdots & \cdots & \cdots & \cdots & & & & & & & & \\
\cdots & \cdots & 0 & & & & & & & & & \\
0 & \sum_{j=n}^{n}\sum_{i=3}^{n} a_{(i-2)j}a_{ji} & & & & & & & & & & \\
0 & & & & & & & & & & &
\end{array} \Bigg\rangle \tag{2.18}$$

For $n = 5$, the entries of R_n^2 are as follows:

$$\begin{aligned}
\sum_{n=5}\sum_{i,j=1}^{3} a_{\frac{(n-1)}{2}i}a_{j\frac{(n-1)}{2}} &= a_{21}a_{12} + a_{22}a_{22} + a_{23}a_{32} \\
&= 0 + 1 + 0 \\
&= 1,
\end{aligned}$$

$$\begin{aligned}
\sum_{n=5}\sum_{i,j=1}^{2} c_{\frac{(n-1)}{2}i}c_{j\frac{(n-1)}{2}} &= c_{21}c_{12} + c_{22}c_{22} \\
&= 1 + 0 \\
&= 1,
\end{aligned}$$

$$\begin{aligned}
\sum_{n=5}\sum_{i,j=1}^{2} c_{\frac{(n-3)}{2}i}c_{j\frac{(n-3)}{2}} &= c_{11}c_{11} + c_{12}c_{21} \\
&= 0 + 1 \\
&= 1,
\end{aligned}$$

$$\begin{aligned}
\sum_{n=5}\sum_{i,j=1}^{2} c_{\frac{(n-1)}{2}i}c_{j\frac{(n-3)}{2}} &= c_{11}c_{12} + c_{12}c_{22} \\
&= 0 + 0 \\
&= 0
\end{aligned}$$

and $\sum_{n=5}\sum_{i,j=1}^{2} c_{\frac{(n-3)}{2}i}c_{j\frac{(n-1)}{2}} = c_{21}c_{11} + c_{22}c_{21}$

$$\begin{aligned}
&= 0 + 0 \\
&= 0.
\end{aligned}$$

Clearly, $\left\langle \begin{array}{ccc} & 1 & \\ 0 & 1 & 0 \\ & 1 & \end{array} \right\rangle$ is a sub-rhotrix of R_n^2 over the finite field $\mathbb{F}_2$.

Similarly, for $n = 7$, the entries of R_n^2 are as follows:

$$\sum_{n=7}\sum_{i,j=1}^{3} c_{\frac{(n-3)}{2}i}c_{j\frac{(n-3)}{2}} = c_{21}c_{12} + c_{22}c_{22} + c_{23}c_{32}$$

$$= 0 + 1 + 0$$
$$= 1,$$

$$\sum_{n\,=\,7}\ \sum_{i\,,j=1}^{4} a_{\frac{(n-1)}{2}\,i}\, a_{j\,\frac{(n-1)}{2}} = a_{31}a_{13} + a_{32}a_{23} + a_{33}a_{33} + a_{34}a_{43}$$
$$= 1 + 0 + 1 + 0$$
$$= 0,$$

$$\sum_{n\,=\,7}\ \sum_{i\,,j=1}^{4} a_{\frac{(n-3)}{2}\,i}\, a_{j\,\frac{(n-3)}{2}} = a_{21}a_{12} + a_{22}a_{22} + a_{23}a_{32} + a_{24}a_{42}$$
$$= 0 + 1 + 0 + 1$$
$$= 0,$$

$$\sum_{n\,=\,7}\ \sum_{i\,,j=1}^{4} a_{\frac{(n-1)}{2}\,i}\, a_{j\,\frac{(n-3)}{2}} = a_{31}a_{12} + a_{32}a_{22} + a_{33}a_{32} + a_{34}a_{42}$$
$$= 0 + 0 + 0 + 0$$
$$= 0,$$

and $\sum_{n\,=\,7}\ \sum_{i\,,j=1}^{4} a_{\frac{(n-3)}{2}\,i}\, a_{j\,\frac{(n-1)}{2}} = a_{21}a_{13} + a_{22}a_{23} + a_{23}a_{33} + a_{24}a_{43}$

$$= 0 + 0 + 0 + 0$$
$$= 0,$$

Clearly, $\left\langle \begin{array}{ccc} & 0 & \\ 0 & 1 & 0 \\ & 0 & \end{array} \right\rangle$ is a sub-rhotrix of R_n^2 over the finite field $\mathbb{F}_2$.

Therefore, in the same way for other values of n, we conclude the desired result of (2.17) for R_n^2 rhotrix. □

3 Illustrations

Here, we illustrate some results given in section 2 with the help of examples.

Example 3.1. Let R_5 be a rhotrix satisfying the condition **P** of (1.6) and let it given by

$$R_5 = \left\langle \begin{array}{ccccc} & & 1 & & \\ & 0 & 1 & 0 & \\ 1 & 0 & 1 & 0 & 1 \\ & 0 & 1 & 0 & \\ & & 1 & & \end{array} \right\rangle.$$

Now, $R_5^2 = R_5 R_5$

$$= \left\langle \begin{array}{ccccc} & & 1 & & \\ & 0 & 1 & 0 & \\ 1 & 0 & 1 & 0 & 1 \\ & 0 & 1 & 0 & \\ & & 1 & & \end{array} \right\rangle \left\langle \begin{array}{ccccc} & & 1 & & \\ & 0 & 1 & 0 & \\ 1 & 0 & 1 & 0 & 1 \\ & 0 & 1 & 0 & \\ & & 1 & & \end{array} \right\rangle,$$

$$= \left\langle \begin{array}{ccccc} & & 2 & & \\ & 0 & 1 & 0 & \\ 2 & 0 & 1 & 0 & 2 \\ & 0 & 1 & 0 & \\ & & 2 & & \end{array} \right\rangle.$$

Since, all the entries of above rhotrix belong to the finite field $\mathbb{F}_2$, therefore, we get

$$R_5^2 = \left\langle \begin{array}{ccccc} & & 0 & & \\ & 0 & 1 & 0 & \\ 0 & 0 & 1 & 0 & 0 \\ & 0 & 1 & 0 & \\ & & 0 & & \end{array} \right\rangle. \tag{3.1}$$

Clearly, the heart of matrix R_5^2 over the finite field $\mathbb{F}_2$ is 1. Further, from (3.1) it is concluded that, there is a sub-rhotrix of R_5^2 of the form $\left\langle \begin{array}{ccc} & 1 & \\ 0 & 1 & 0 \\ & 1 & \end{array} \right\rangle$.

Example 3.2. Let R be a rhotrix of 7-dimensions satisfying the condition **P** of (1.6) and suppose it is given by

$$R_7 = \left\langle \begin{array}{ccccccc} & & & 1 & & & \\ & & 0 & 1 & 0 & & \\ & 1 & 0 & 1 & 0 & 1 & \\ 0 & 1 & 0 & 1 & 0 & 1 & 0 \\ & 1 & 0 & 1 & 0 & 1 & \\ & & 0 & 1 & 0 & & \\ & & & 1 & & & \end{array} \right\rangle.$$

Now,

$$R_7^2 = \left\langle \begin{array}{ccccccccc} & & & 1 & & & & & \\ & & 0 & 1 & 0 & & & & \\ & 1 & 0 & 1 & 0 & 1 & & & \\ 0 & 1 & 0 & 1 & 0 & 1 & 0 & & \\ & 1 & 0 & 1 & 0 & 1 & & & \\ & & 0 & 1 & 0 & & & & \\ & & & 1 & & & & & \end{array} \right\rangle \left\langle \begin{array}{ccccccccc} & & & 1 & & & & & \\ & & 0 & 1 & 0 & & & & \\ & 1 & 0 & 1 & 0 & 1 & & & \\ 0 & 1 & 0 & 1 & 0 & 1 & 0 & & \\ & 1 & 0 & 1 & 0 & 1 & & & \\ & & 0 & 1 & 0 & & & & \\ & & & 1 & & & & & \end{array} \right\rangle,$$

$$= \left\langle \begin{array}{ccccccccc} & & & 2 & & & & & \\ & & 0 & 2 & 0 & & & & \\ & 2 & 0 & 2 & 0 & 2 & & & \\ 0 & 2 & 0 & 1 & 0 & 2 & 0 & & \\ & 2 & 0 & 2 & 0 & 2 & & & \\ & & 0 & 2 & 0 & & & & \\ & & & 2 & & & & & \end{array} \right\rangle.$$

After reducing all the entries over the finite field $\mathbb{F}_2$, we get

$$R_7^2 = \left\langle \begin{array}{ccccccccc} & & & 0 & & & & & \\ & & 0 & 0 & 0 & & & & \\ & 0 & 0 & 0 & 0 & 0 & & & \\ 0 & 0 & 0 & 1 & 0 & 0 & 0 & & \\ & 0 & 0 & 0 & 0 & 0 & & & \\ & & 0 & 0 & 0 & & & & \\ & & & 0 & & & & & \end{array} \right\rangle. \tag{3.2}$$

Therefore, it is clear from (3.2) that there exist a sub-rhotrix of R_7^2 which is of the form $\left\langle \begin{array}{ccc} & 0 & \\ 0 & 1 & 0 \\ & 0 & \end{array} \right\rangle$.

4 Conclusion

We considered the rhotrices of 3-dimensions and derived some properties related to their characteristic roots. Further, we discussed results related to the heart and sub-rhotrix of n-dimensional rhotrices.

Abstract

Recently, Kim and Son [9] have obtained an infinite sequence of irreducible polynomials over the finite field F_q of characteristic p by using the transformation $x \to \frac{x^p - x^{p-1} + 1}{-x^{p-1} + 1}$. Here, it is shown that one can also build this infinite sequence of irreducible polynomials over the field F_q of characteristic p by using a different transformation $x \to \frac{x^p - x^{p-1} + 1}{x^p}$. Moreover, this transformation is helpful to establish the sequence of normal polynomials $(F_r(x))_{r \geq 0}$ of degree np^r in $F_q[x]$ by using an appropriate initial normal polynomial of degree n.

ON ARRESTING THE COMPLEX GROWTH RATE OF A PERTURBATION IN FERROTHERMOSOLUTAL CONVECTION IN A POROUS MEDIUM: DARCY MODEL

Jyoti Prakash*, Virender Singh, Chitresh Kumari and Khem Chand
Department of Mathematics and Statistics, Himachal Pradesh University, Summer Hill, Shimla-171005, India.
*Email: jpsmaths67@gmail.com

Abstract: In the present paper upper bounds for the complex growth rate of a disturbance in ferrothermosolutal convection in a porous medium have been obtained by using Darcy model. It is proved that the complex growth rate $\sigma = \sigma_r + i\sigma_i$($\sigma_r$ and σ_i are respectively the real and imaginary parts of σ) of an arbitrary oscillatory perturbation of growing amplitude in ferrothermosolutal convection in a densely packed porous medium, for the case of free boundaries, lies inside a semicircle in the right half of the $\sigma_r\sigma_i$-plane whose center is at the origin and radius $= \sqrt{\frac{\varepsilon R_s\left[1-M_1'\left(1-\frac{1}{M_5}\right)\right]}{P_s}}$, where R_s is the solutal Rayleigh number, ε is the porosity of the medium, P_s is the solutal Prandtl number, M_1' is the ratio of magnetic flux due to concentration fluctuation to the gravitational force and M_5 is the ratio of concentration effect on magnetic field to pyromagnetic coefficient. Further, the case of deriving upper bounds for rigid boundaries is also dealt separately.

Keywords: Ferrofluid, Ferrothermosolutal Convection, Porous Medium, Darcy Model.

1. Introduction

A ferrofluid also known as magnetic Nano fluid is composed of small particles (dimensions of 3-15 nm) of solid, magnetic particles coated with some surfactant to prevent their aggregation and dispersed in a liquid carrier such as water, kerosene or ester. A ferrofluid does not exist in nature but are synthesized. Being highly interdisciplinary in nature, the ferrofluid researches has brought engineers, applied Mathematicians, Chemists, Physicians, theoretical and experimental Physicist together which ultimately resulted into wide range of practical applications e. g. energy conversion devices,noiseless jet printing system, high speed silent printers, liquid cooled loudspeakers, sealing of computer hard disc drives, the treatment of ulcers and brain tumours, destroying cancer cells, contrast enhancement of magnetic resonance imaging (MRI) etc. (Rosensweig [18], Odenbach [7-8]).

The concept of thermal convection in ferrofluids in the presence of magnetic field is similar to Bénard convection. These manifold practical applications of ferrofluids have attracted many scientists towards the study of thermal convection in ferrofluids in porous/non-porous media. In a fundamental paper Finlayson [4] studied the convective instability of ferromagnetic fluids and explained the concept of thermomechanical interactions in ferrofluids. Lalas and Carmi [6] investigated the thermoconvective stability of ferrofluids without considering buoyancy effects. Rosensweig et al. [19] investigated experimentally the penetration of ferrofluids in a Hele-Shaw cell. Gupta and Gupta [5] studied the effect of rotation on the convective instability of a layer of a ferromagnetic fluid. The effect of magnetic field dependent (MFD) viscosity on the thermal convection in a ferrofluid layer saturating a sparsely distributed porous medium has been studied by Prakash et al. [14].

For a broad view of the study of ferroconvection with heat as a single diffusive component one may be referred to Rahman and Suslov [16], Sekar and Vaidyanathan [22], Prakash [12], Prakash et al.[14], Ekaterina and Ekaterina [3], Prakasha [15], Ram et al. [17].

Moreover, since ferrofluids are mostly organic solvent carriers having suspensions of ferromagnetic salts acting as solute, it is also important to study the convective instability in ferrofluid layer having two diffusive components (also known as ferrothermosolutal convection). Several researchers have contributed in the development of ferrothermosolutal convection problem in porous/non-porous media. Vaidyanathan et al. [26] have studied the effect of a concentration gradient on double diffusive ferrofluid layer saturating a porous medium heated from below and salted from above for fixed particle suspensions causing various porosities. Sekar and Raju [21] investigated the effect of sparse distribution pores in thermohaline convection in a micropolar ferromagnetic fluid. Sekar and Murugan [25] studied the linear stability effect of densely distributed porous medium and coriolis force on Soret driven ferrothermohaline convection.For more studies one may be referred to Sekar et al. [23-24].

Since for a double diffusive ferroconvection problem the exact solutions in closed form are not possible for the cases where both the boundaries are not free, therefore the problem of obtaining the upper bounds for the complex growth rate of an arbitrary disturbance has its own importance[1]. Recently, Prakash [9-10] has derived upper bounds for the complex growth rates in some ferromagnetic convection problems in porous/non-porous medium. Prakash and Gupta [11] have extended his work to include the effect of rotation and magnetic field dependent viscosity on ferromagnetic convection. Recently, Prakash and Bala [13] also derived the upper bounds for complex growth rates in ferromagnetic convection with magnetic field dependent viscosity in a rotating sparsely distributed porous medium. To the best of our knowledge no attempt has been made, so far, to find such bounds for the case of ferrothermosolutal convection configurations.

Thus as a further step, we have derived the upper bounds for the complex growth rates in ferrothermosolutal convection in a densely packed porous medium in the presence of a uniform vertical magnetic field for the cases of free and rigid boundaries separately. The

present work will definitely pave the way for further theoretical and experimental investigations in this field of enquiry.

2. Mathematical Formulation

Consider a ferromagnetic Boussinesq fluid layer of infinite horizontal extension and finite vertical thickness d, saturating a densely packed porous medium heated and salted from below. The fluid layer is statically confined between the horizontal boundaries $z = 0$ and $z = d$ which are respectively maintained at uniform temperatures T_0 and $T_1(< T_0)$ and concentrations S_0 and $S_1(< S_0)$ under the action of a uniform vertical magnetic field $\boldsymbol{H}$ (see Fig.1). Darcy model has been used to analyze this problem.

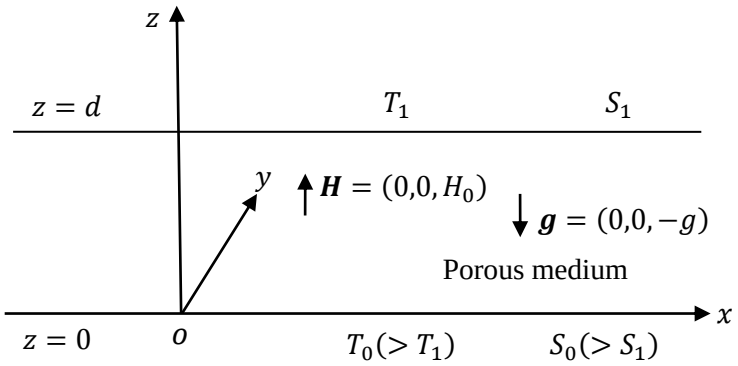

Fig 1 Geometrical configuration of the problem.

The Basic hydrodynamic equations governing the flow of the ferromagnetic fluid for the above model are given by (Finlayson [4] Divya et al. [2])

$$\nabla . \boldsymbol{q} = 0, \tag{1}$$

$$\frac{\rho_0}{\varepsilon}\left[\frac{\partial}{\partial t} + \frac{1}{\varepsilon}(\boldsymbol{q}.\nabla)\right]\boldsymbol{q} = -\nabla p + \rho \boldsymbol{g} + \nabla.(\boldsymbol{HB}) - \frac{\mu}{k_1}\boldsymbol{q}, \tag{2}$$

$$\varepsilon\left[\rho_0 C_{V,H} - \mu_0 \boldsymbol{H}.\left(\frac{\partial \boldsymbol{M}}{\partial T}\right)_{V,H}\right]\frac{DT}{Dt} + (1-\varepsilon)\rho_s C_s \frac{\partial T}{\partial t} + \mu_0 T\left(\frac{\partial \boldsymbol{M}}{\partial T}\right)_{V,H}.\frac{D\boldsymbol{H}}{Dt} = K_1 \nabla^2 T + \Phi_T, \tag{3}$$

$$\varepsilon\left[\rho_0 C_{V,H} - \mu_0 \boldsymbol{H}.\left(\frac{\partial \boldsymbol{M}}{\partial S}\right)_{V,H}\right]\frac{DS}{Dt} + (1-\varepsilon)\rho_s C_s \frac{\partial S}{\partial t} + \mu_0 S\left(\frac{\partial \boldsymbol{M}}{\partial S}\right)_{V,H}.\frac{D\boldsymbol{H}}{Dt} = K_1' \nabla^2 S + \Phi_S, \tag{4}$$

where $\boldsymbol{q}, \varepsilon, t, p, \boldsymbol{H}, \boldsymbol{B}, \mu, \boldsymbol{g}(0,0-g), k_1, C_{V,H}, \mu_0, T, S, \boldsymbol{M}, K_1, K_1', \Phi_T$and Φ_S denote respectively the velocity, porosity of the medium, time, pressure, magnetic field, magnetic induction, variable viscosity, acceleration due to gravity, permeability of the porous medium, heat capacity at constant volume and magnetic field, magnetic permeability, temperature, concentration, magnetization, thermal conductivity, solute conductivity, viscous dissipation function containing second order terms in velocity gradient and viscous dissipation function analogous to Φ_T but corresponding to solute.

The equation of state is given by

$$\rho = \rho_0[1 - \alpha(T - T_0) + \alpha'(S - S_0)], \tag{5}$$

where ρ is the fluid density, ρ_0 is the reference density, α is the coefficient of volume expansion, α' is an analogous solvent coefficient of expansion, T_0 is the temperature and S_0 is the concentration at the lower boundary.

Maxwell's equations for non-conducting fluid with no displacement current given by Finlayson (1970) as

$$\nabla . \boldsymbol{B} = 0, \nabla \times \boldsymbol{H} = \boldsymbol{0}. \tag{6a,b}$$

Further, the relation between $\boldsymbol{B}$and$\boldsymbol{H}$is expressed by

$$\boldsymbol{B} = \mu_0(\boldsymbol{H} + \boldsymbol{M}). \tag{7}$$

It is assumed that the magnetization is aligned with the magnetic field intensity and depends on the magnitude of magnetic field, temperature and salinity (Finlayson [4]), so that

$$\boldsymbol{M} = \frac{\boldsymbol{H}}{H} M(H, T, S). \tag{8}$$

Finally, the linearized magnetic equation of state is given by

$$M = M_o + \chi(H - H_0) - K_2(T - T_0) + K_3\,(S - S_0). \tag{9}$$

In the above equation $M_0 = M(H_0, T_0, S_0)$ is the magnetization when magnetic field is H_0, temperature is T_0 and concentration is S_0, $\chi = \left(\frac{\partial M}{\partial H}\right)_{H_0,T_0}$ is magnetic susceptibility, $K_2 = -\left(\frac{\partial M}{\partial T}\right)_{H_0,T_0}$ is the pyromagnetic coefficient, $K_3 = \left(\frac{\partial M}{\partial S}\right)_{H_0,S_0}$ is the salinity magnetic coefficient, H is the magnitude of $\boldsymbol{H}$, M is the magnitude of $\boldsymbol{M}$.

Now following Finlayson [4] and Divya et al. [2] using linear stability theory, we obtain the following set of non-dimensional equations

$$\left(\frac{\sigma}{\varepsilon} + \frac{1}{k_1}\right)(D^2 - a^2)w = a\,{R_a}^{1/2}\left[(M_1 - M_4)D\Phi_1 - (1 + M_1 - M_4)\theta\right] + a\,{R_s}^{1/2}[(M_1' - M_4')D\Phi_2 + (1 - M_1' + M_4')\phi], \tag{10}$$

$$(D^2 - a^2 - \sigma P_r)\theta = -(1 - M_2)a{R_a}^{1/2}w - P_r'\,M_2\sigma D\Phi_1, \tag{11}$$

$$(D^2 - a^2 - \sigma P_s)\phi = -(1 - M_2')a{R_s}^{1/2}w - P_s'M_2'\sigma D\Phi_2, \tag{12}$$

$$(D^2 - a^2M_3)\Phi_1 = D\theta, \tag{13}$$

$$(D^2 - a^2M_3)\Phi_2 = D\phi, \tag{14}$$

where z is the real independent variable such that $0 \le z \le 1$, D is differentiation with respect to z, a^2 is square of the wave number, $P_r = \frac{\nu\rho C_1}{K_1} > 0$ is the thermal Prandtl

number,$P_s = \frac{\nu\rho C_1'}{K_1'} > 0$ is the solutal Prandtl number,, $\sigma = \frac{nd^2}{\nu}$ is the complex growth rate, $R_a = \frac{g\alpha\beta d^4\rho C_2}{K_1\nu} > 0$ is the thermal Rayleigh number, $R_s = \frac{g\alpha'\beta' d^4\rho C_2'}{K_1'\nu} > 0$ is the concentration Rayleigh number,$M_1 = \frac{\mu_0 K_2^2\,\beta}{(1+\chi)\alpha\rho_0 g} > 0$ is the ratio of magnetic force due to temperature fluctuation to the gravitational force, $M_2 = \frac{\mu_0 T_0 K_2^2}{(1+\chi)\rho C_2} > 0$ is the ratio of thermal flux due to magnetization to magnetic flux, $M_1' = \frac{\mu_0 K_3^2\beta'}{(1+\chi)\alpha'\rho_0 g} > 0$ is the ratio of magnetic flux due to concentration fluctuation to the gravitational force, $M_2' = \frac{\mu_0 S_0 K_3^2}{(1+\chi)\rho C_2'} > 0$ is the ratio of mass flux due to magnetization to magnetic flux, $M_4 = \frac{\mu_0 K_2 K_3\beta'}{(1+\chi)\alpha\,\rho_0 g} > 0$ and $M_4' = \frac{\mu_0 K_2 K_3\,\beta}{(1+\chi)\alpha'\rho_0 g} > 0$ are nondimentional parameters, , $M_5 = \frac{M_4}{M_1} = \frac{M_1'}{M_4'} = \frac{K_3\beta'}{K_2\beta} > 0$ is the ratio of concentration effect on magnetic field to pyromagnetic coefficient, $M_3 = \frac{1+\frac{M_0}{H_0}}{(1+\chi)} > 0$ is the measure of the nonlinearity of magnetization, $\sigma = \sigma_r + i\sigma_i$ is a complex constant in general such that σ_r and σ_i are real constants and as a consequence the dependent variables $w(z) = w_r(z) + i\,w_i(z)$, $\theta(z) = \theta_r(z) + i\,\theta_i(z)$, $\phi(z) = \phi_r(z) + i\,\phi_i(z), \Phi_1(z) = \Phi_{1r}(z) + i\,\Phi_{1i}(z)$, $\Phi_2(z) = \Phi_{2r}(z) + i\,\Phi_{2i}(z)$ and are complex valued functions of the real variable z such that $w_r(z)$, $w_i(z)$, $\theta_r(z)$, $\theta_i(z)$, $\phi_r(z), \phi_i(z), \Phi_{1r}(z)$, $\Phi_{1i}(z), \Phi_{2r}(z)and\Phi_{2i}(z)$ are real valued functions of the real variable z.

Since, M_2 and M_2' are of very small order (Finlayson [4]), they are neglected in the subsequent analysis and thus Eqs. (11) and (12) takes the forms

$$(D^2 - a^2 - \sigma P_r)\theta = -aR_a{}^{1/2}w, \tag{15}$$

$$(D^2 - a^2 - \sigma P_s)\phi = -aR_s{}^{1/2}w, \tag{16}$$

respectively.

The bounding surfaces are considered to be either free or rigid. Hence the boundary conditions are given by

$$w = 0 = \theta = \phi = D\Phi_1 = D\Phi_2 \text{ at } z = 0 \text{ and } z = 1, \tag{17}$$

(both the boundaries are free)

$$\text{or } w = 0 = \theta = \phi = Dw = \Phi_1 = \Phi_2 \text{ at } z = 0 \text{ and } z = 1. \tag{18}$$

(both the boundaries are rigid)

It may further be noted that Eqs. (10) and (13) - (18) describe an eigenvalue problem for σ and govern ferrothermosolutal convection in densely packed porous medium heated and salted from below.

3. Mathematical Analysis

We now derive upper bounds for the complex growth rate of the arbitrary oscillatory perturbations of neutral or growing amplitude for the present configuration. The cases of free and rigid boundaries are studied separately. We prove the following theorems:

Theorem1: If $R_a > 0, R_s > 0, \quad M_1' > 0, 1 - M_5 > 0, P_s > 0, \sigma_r \geq 0, \delta > 0$ and $\sigma_i \, (\neq 0)$, then a necessary condition for the existence of a nontrivial solution $(w, \theta, \phi, \Phi_1, \Phi_2, \sigma)$ of the equations (10) and (13) - (18) together with the boundary conditions (17) is that $|\sigma| < \sqrt{\frac{\varepsilon R_s\left[1-M_1'\left(1-\frac{1}{M_5}\right)\right]}{P_s}}$.

Proof: Multiplying Eq. (10) by w^* (the superscript * henceforth represents the complex conjugation) throughout and integrating the resulting equation over the interval [0,1] and using the boundary conditions (17), we obtain

$$\left(\frac{\sigma}{\varepsilon}+\frac{1}{k_1}\right)\int_0^1 w^*(D^2-a^2)w\,dz = aR_a^{1/2}(M_1-M_4)\int_0^1 w^* D\Phi_1\,dz - aR_a^{1/2}(1+M_1-M_4)\int_0^1 w^*\theta\,dz + aR_s^{1/2}(M_1'-M_4')\int_0^1 w^* D\Phi_2\,dz + aR_s^{1/2}(1-M_1'+M_4')\int_0^1 w^*\phi\,dz. \tag{19}$$

Using Eqs. (13) - (16) and boundary conditions Eq. (17), the various terms of right hand side of Eq. (19) can respectively be written as

$$aR_a^{1/2}(M_1-M_4)\int_0^1 w^* D\Phi_1\,dz = -M_1(1-M_5)\int_0^1 D\Phi_1(D^2-a^2-\sigma^* P_r)\theta^*\,dz$$

$$= -M_1(1-M_5)\int_0^1 D\Phi_1 D^2\,\theta^* dz + M_1(1-M_5)(a^2+\sigma^* P_r)\int_0^1 \theta^*\, D\Phi_1 dz$$

$$= M_1(1-M_5)\int_0^1 D^2\Phi_1 D\theta^* dz - M_1(1-M_5)(a^2+\sigma^* P_r)\int_0^1 \Phi_1 D\theta^* dz$$

$$= M_1(1-M_5)\int_0^1 D^2\Phi_1(D^2-a^2M_3)\Phi_1^* dz - M_1(1-M_5)(a^2+\sigma^* P_r)\int_0^1 \Phi_1\,(D^2-a^2M_3)\Phi_1^* dz, \text{ (utilizing Eq. (13))} \tag{20}$$

$$aR_a^{1/2}(1+M_1-M_4)\int_0^1 w^*\theta\,dz = -[1+M_1(1-M_5)]\int_0^1 \theta(D^2-a^2-\sigma^* P_r)\theta^* dz. \tag{21}$$

Following the same procedure as is used to obtain Eq. (20), we have on utilizing Eq. (14) that

$$aR_s^{1/2}(M_1'-M_4')\int_0^1 w^*\, D\Phi_2 dz =$$

$$-M_4'(1-M_5)\int_0^1 D^2\Phi_2\,(D^2-a^2\,M_3)\Phi_2{}^* dz + M_4'(1-M_5)(a^2+\sigma^* P_s)\int_0^1 \Phi_2\,(D^2-a^2\,M_3)\Phi_2{}^* dz. \tag{22}$$

Further, on using (16), we have

$$aR_s^{1/2}(1-M_1'+M_4')\int_0^1 w^*\phi\,dz = -\left[1-M_1'\left(1-\frac{1}{M_5}\right)\right]\int_0^1 \phi\,(D^2-a^2-\sigma^*P_s)\phi^*dz. \tag{23}$$

Combining Eqs. (19) - (23), we obtain

$$\left(\frac{\sigma}{\varepsilon}+\frac{1}{k_1}\right)\int_0^1 w^*\,(D^2-a^2)wdz = M_1(1-\ M_5\,)\int_0^1 D^2\Phi_1(D^2-a^2M_3)\Phi_1^*dz - M_1(1-\ M_5\,)(a^2+\sigma^*P_r)\int_0^1 \Phi_1\,(D^2-a^2M_3)\Phi_1^*dz + [1+M_1(1-M_5\,)]\int_0^1 \theta(D^2-a^2-\sigma^*P_r)\theta^*dz - M_4'(1-\ M_5\,)\int_0^1 D^2\Phi_2(D^2-a^2M_3)\Phi_2^*dz + M_4'(1-\ M_5\,)(a^2+\sigma^*P_s)\int_0^1 \Phi_2\,(D^2-a^2M_3)\Phi_2^*dz - \left[1-M_1'\left(1-\tfrac{1}{M_5}\right)\right]\int_0^1 \phi\,(D^2-a^2-\sigma^*P_s)\phi^*dz. \tag{24}$$

Integrating the various terms of Eq. (24), by parts, for a suitable number of times with the help of the boundary conditions (17) and the equality

$$\int_0^1 \psi^*\,D^{2n}\psi dz\ = (-1)^n\int_0^1 |D^n\psi|^2dz, \tag{25}$$

where $\psi = w, \theta, \phi, \Phi_1, \Phi_2 (n = 1\,)$,

we get

$$\left(\frac{\sigma}{\varepsilon}+\frac{1}{k_1}\right)\int_0^1(|Dw|^2+a^2|w|^2)\,dz = -M_1(1-\ M_5\,)\int_0^1(|\,D^2\Phi_1|^2+a^2M_3|D\Phi_1|^2)dz - M_1(1-\ M_5\,)(a^2+\sigma^*P_r)\int_0^1(|D\Phi_1|^2+a^2M_3|\Phi_1|^2)\,dz + [1+M_1(1-M_5\,)]\int_0^1(|D\theta|^2+(a^2+\sigma^*P_r)|\theta|^2)\,dz + M_4'(1-\ M_5\,)\int_0^1(|\,D^2\Phi_2|^2+a^2M_3|D\Phi_2|^2)dz + M_4'(1-\ M_5\,)(a^2+\sigma^*P_s)\int_0^1(|D\Phi_2|^2+a^2M_3|\Phi_2|^2)\,dz - \left[1-M_1'\left(1-\tfrac{1}{M_5}\right)\right]\int_0^1(|D\phi|^2+(a^2+\sigma^*P_s)|\phi|^2)dz. \tag{26}$$

Equating imaginary parts of both sides of Eq. (26) and cancelling $\sigma_i(\neq 0)$, we obtain

$$\frac{1}{\varepsilon}\int_0^1(|Dw|^2+a^2|w|^2)\,dz = M_1(1-\ M_5\,)P_r\int_0^1(|D\Phi_1|^2+a^2M_3|\Phi_1|^2)\,dz - [1+M_1(1-M_5\,)]P_r\int_0^1|\theta|^2dz - M_4'(1-\ M_5\,)P_s\int_0^1(|D\Phi_2|^2+a^2M_3|\Phi_2|^2)\,dz + \left[1-M_1'\left(1-\tfrac{1}{M_5}\right)\right]P_s\int_0^1|\phi|^2dz. \tag{27}$$

Now multiplying Eq. (13) by Φ_1^* and integrating over the interval [0,1], we get

$$\int_0^1(|D\Phi_1|^2+a^2M_3|\Phi_1|^2)\,dz = \int_0^1(D\Phi_1^*)\theta dz$$

$$\leq\left|\int_0^1(D\Phi_1^*)\theta dz\right| \leq \int_0^1|(D\Phi_1^*)\theta|dz \leq \int_0^1|D\Phi_1^*|\,|\theta|dz \leq \int_0^1|D\Phi_1||\theta|dz$$

$$\leq \left(\int_0^1 |D\Phi_1|^2 dz\right)^{1/2} \left(\int_0^1 |\theta|^2 dz\right)^{1/2}, \tag{28}$$

(using the Schwartz's inequality)

which gives

$$\int_0^1 |D\Phi_1|^2 dz \leq \left(\int_0^1 |D\Phi_1|^2 dz\right)^{1/2} \left(\int_0^1 |\theta|^2 dz\right)^{1/2},$$

and hence

$$\left(\int_0^1 |D\Phi_1|^2 dz\right)^{1/2} \leq \left(\int_0^1 |\theta|^2 dz\right)^{1/2}. \tag{29}$$

On the similar lines Eq. (14) yieldsthe inequality

$$\left(\int_0^1 |D\Phi_2|^2 dz\right)^{1/2} \leq \left(\int_0^1 |\phi|^2 dz\right)^{1/2}. \tag{30}$$

Combining inequality (28) in inequality Eq. (29), we get

$$\int_0^1 (|D\phi_1|^2 + a^2 M_3 |\Phi_1|^2)\, dz \leq \int_0^1 |\theta|^2 dz. \tag{31}$$

Now multiplying Eq. (16) by its complex conjugate and integratingover the interval [0,1]for suitable of times by making use of boundary conditions (17).The real part of this resulting equation gives

$$\int_0^1 (|D^2\phi|^2 + 2a^2 |D\phi|^2 + a^4 |\phi|^2) dz + 2\sigma_r P_s \int_0^1 (|D\phi|^2 + a^2 |\phi|^2) dz + |\sigma|^2 {P_s}^2 \int_0^1 |\phi|^2 dz = a^2 R_s \int_0^1 |w|^2 dz. \tag{32}$$

Since $P_s \geq 0$, therefore from Eq. (32), we obtain

$$\int_0^1 |\phi|^2 dz \; < \frac{R_s a^2}{{P_s}^2 |\sigma|^2} \int_0^1 |w|^2 dz\,. \tag{33}$$

Using inequalities Eqs. (31) and (33) in Eq. (27), we obtain

$$\frac{1}{\varepsilon}\int_0^1 |Dw|^2 dz \; + \; a^2 \left[\frac{1}{\varepsilon} - \frac{\left[1 - M_1'\left(1 - \frac{1}{M_5}\right)\right] R_s}{P_s |\sigma|^2}\right] \int_0^1 |w|^2 dz \; + \; P_r \int_0^1 |\theta|^2 dz + \; M_4'(1 - M_5) P_s \int_0^1 (|D\Phi_2|^2 + a^2 M_3 |\Phi_2|^2) dz < 0, \tag{34}$$

which clearly implies that

$$|\sigma| < \sqrt{\frac{\varepsilon R_s \left[1 - M_1'\left(1 - \frac{1}{M_5}\right)\right]}{P_s}}.$$

This establishes the theorem.

The theorem proved above may be stated in an equivalent form, from the physical point of view, as: the complex growth rate of an arbitrary oscillatory motion of neutral or

growing amplitude in ferrothermosolutal convection in a densely packed porous medium, for the case of free boundaries, lies inside a semi-circle in the right half of the $\sigma_r\sigma_i$- plane whose centre is at the origin and radius equals to $\sqrt{\frac{\varepsilon R_s\left[1-M_1'\left(1-\frac{1}{M_5}\right)\right]}{P_s}}$.

Theorem2: If $R_a > 0,\ \ R_s > 0, M_1 > 0, M_1' > 0, 1 - M_5 > 0, P_r > 0,\ P_s > 0,\ \sigma_r \geq 0,$ $\delta > 0$ and $\sigma_i \neq 0$, then a necessary condition for the existence of a nontrivial solution $(w, \theta, \phi, \Phi_1, \Phi_2\ \sigma,)$ of the equations (10) and (13) - (16) together with the boundaryconditions (18) is that

$$|\sigma|^2\sigma_i^2 \ < \varepsilon^2\left\{\frac{R_a M_1(1-M_5)}{P_r} + \frac{R_s}{P_s}\left(1 + M_1'\left|1-\frac{1}{M_5}\right| - M_1'\left(1-\frac{1}{M_5}\right)\right)\right\}^2.$$

Proof: Multiplying equation (10) by w^* throughout and integrating the resulting equation over the interval [0,1], we get

$$\left(\frac{\sigma}{\varepsilon}+\frac{1}{k_1}\right)\int_0^1 w^*(D^2-a^2)\,w dz = a\,R_a{}^{1/2}(M_1 - M_4)\int_0^1 w^* D\Phi_1 dz - a\,R_a{}^{\frac{1}{2}}[1 + M_1 - M_4]\int_0^1 w^*\,\theta\,dz + a\,R_s{}^{\frac{1}{2}}(M_1' - M_4')\int_0^1 w^* D\Phi_2 dz + a\,R_s{}^{1/2}[1 - M_1' + M_4']\int_0^1 w^*\,\phi dz. \tag{35}$$

Eqs. (15) and (16) respectively yields

$$-a\,R_a{}^{1/2}[1 + M_1 - M_4]\int_0^1 w^*\theta\,dz \ = \ [1 + M_1(1 - M_5)]\int_0^1 \theta\,(D^2 - a^2 - P_r\sigma^*)\theta^* dz, \tag{36}$$

and

$$a\,R_s{}^{1/2}[1 - M_1' + M_4']\int_0^1 w^*\,\phi dz = -\left[1 - M_1'\left(1-\frac{1}{M_5}\right)\right]\int_0^1 \phi\,(D^2 - a^2 - P_s\sigma^*)\phi^* dz. \tag{37}$$

Combining Eqs. (35) – (37), we obtain

$$\left(\frac{\sigma}{\varepsilon}+\frac{1}{k_1}\right)\int_0^1 w^*(D^2-a^2)\,w dz \ = a\,R_a{}^{\frac{1}{2}}M_1(1 - M_5)\int_0^1 w^* D\Phi_1 dz + [1 + M_1(1 - M_5)]\int_0^1 \theta\,(D^2 - a^2 - P_r\sigma^*)\theta^* dz + a\,R_s{}^{\frac{1}{2}}M_1'\left(1-\frac{1}{M_5}\right)\int_0^1 w^* D\Phi_2 dz - \left[1 - M_1'\left(1-\frac{1}{M_5}\right)\right]\int_0^1 \phi\,(D^2 - a^2 - P_s\sigma^*)\phi^* dz\,. \tag{38}$$

Integrating the various terms of Eq. (38), by parts, for a suitable number of times and utilizing the boundary conditions (18) and equality (25) we get

$$\left(\frac{\sigma}{\varepsilon}+\frac{1}{k_1}\right)\int_0^1(|Dw|^2+a^2|w|^2)dz=-aR_a^{1/2}M_1(1-M_5)\int_0^1 w^*D\Phi_1dz+\ [1+M_1(1-M_5)]\int_0^1(|D\theta|^2+a^2|\theta|^2+P_r\sigma^*|\theta|^2)dz-\ aR_s^{1/2}M_1'\left(1-\frac{1}{M_5}\right)\int_0^1 w^*D\Phi_2dz-\left[1-M_1'\left(1-\frac{1}{M_5}\right)\right]\int_0^1(|D\phi|^2+a^2|\phi|^2+P_s\sigma^*|\phi|^2)\,dz. \quad (39)$$

Equating imaginary parts of both sides of Eq. (39) and dividing the resulting equation by $\sigma_i(\neq 0)$ throughout, we have

$$\frac{1}{\varepsilon}\int_0^1(|Dw|^2+a^2|w|^2)dz\ =-\ \frac{aR_a^{1/2}M_1(1-M_5)}{\sigma_i}\,imaginary\ part\ \text{of}\int_0^1 w^*D\Phi_1dz-[1+M_1(1-M_5)]P_r\int_0^1|\theta|^2\,dz-\ \frac{aR_s^{1/2}M_1'\left(1-\frac{1}{M_5}\right)}{\sigma_i}\,imaginary\ part\ \text{of}\int_0^1 w^*D\Phi_2dz+\left[1-M_1'\left(1-\frac{1}{M_5}\right)\right]P_s\int_0^1|\phi|^2\,dz. \quad (40)$$

Now multiplying Eq. (15) by its complex conjugate and integrating over the interval [0,1], by parts, for an appropriate number of times, using the boundary conditions (18) and then equating the real parts of both sides, we obtain

$$\int_0^1(|D^2\theta|^2+2a^2|D\theta|^2+a^4|\theta|^2)dz+2\sigma_r P_r\int_0^1(|D\theta|^2+a^2|\theta|^2)dz+|\sigma|^2P_r{}^2\int_0^1|\theta|^2dz=a^2R_a\int_0^1|w|^2dz, \quad (41)$$

since $\sigma_r\geq 0$, we have from Eq. (41) that

$$\int_0^1|\theta|^2dz\ \leq\ \frac{R_aa^2}{P_r^2|\sigma|^2}\int_0^1|w|^2dz\,. \quad (42)$$

Combining inequalities (29) and (42), we obtain

$$\left(\int_0^1|D\Phi_1|^2dz\right)^{1/2}\leq\ \frac{aR_a^{1/2}}{P_r|\sigma|}\left(\int_0^1|w|^2dz\right)^{1/2}. \quad (43)$$

Similarly combining inequalities (30) and (33) to obtain

$$\left(\int_0^1|D\Phi_2|^2dz\right)^{1/2}\leq\ \frac{aR_s^{1/2}}{P_s|\sigma|}\left(\int_0^1|w|^2dz\right)^{1/2}. \quad (44)$$

Now, $-\frac{aR_a^{1/2}M_1(1-M_5)}{\sigma_i}\,imaginary\ part\ \text{of}\int_0^1 w^*D\Phi_1dz$

$$\leq aR_a^{1/2}M_1(1-M_5)\left|\frac{1}{\sigma_i}\int_0^1 w^*D\Phi_1dz\right|$$

$$\leq\ \frac{aR_a^{1/2}\,M_1(1-M_5)}{|\sigma_i|}\int_0^1|w||D\Phi_1|\,dz$$

$\leq \frac{aR_a^{1/2} M_1(1-M_5)}{|\sigma_i|}\left(\int_0^1 |w|^2 dz\right)^{1/2}\left(\int_0^1 |D\Phi_1|^2 dz\right)^{1/2}$ (using Schwartz inequality)

$\leq \frac{a^2 R_a M_1(1-M_5)}{P_r|\sigma||\sigma_i|}\int_0^1 |w|^2 dz$. (using inequality (43)) (45)

Similarly, $-\frac{aR_s^{1/2} M_1'\left(1-\frac{1}{M_5}\right)}{\sigma_i}\, imaginary\ part$ of $\int_0^1 w^* D\Phi_2 dz$

$$\leq \frac{aR_s^{1/2} M_1'\left|1-\frac{1}{M_5}\right|}{|\sigma_i|}\int_0^1 |w||D\Phi_2|\, dz$$

$$\leq \frac{aR_s^{1/2} M_1'\left|1-\frac{1}{M_5}\right|}{|\sigma_i|}\left(\int_0^1 |w|^2 dz\right)^{1/2}\left(\int_0^1 |D\Phi_2|^2 dz\right)^{1/2}$$

$\leq \frac{a^2 R_s M_1'\left|1-\frac{1}{M_5}\right|}{P_s|\sigma||\sigma_i|}\int_0^1 |w|^2 dz$. (utilizing inequality (44)) (46)

Now, multiplying Eq. (16) by ϕ^* and integrating the resulting equation, by parts, for an appropriate number of times over the vertical range of z; and then from imaginary part of the final equation, we obtain

$$\int_0^1 |\phi|^2 dz = \frac{1}{\sigma_i}\, imaginary\ part\ of\ \frac{aR_s^{1/2}}{P_s}\int_0^1 \phi^* w dz$$

$$\leq \frac{aR_s^{1/2}}{|\sigma_i|P_s}\left|\int_0^1 \phi^* w dz\right|$$

$\leq \frac{aR_s^{1/2}}{|\sigma_i|P_s}\left(\int_0^1 |\phi|^2 dz\right)^{\frac{1}{2}}\left(\int_0^1 |w|^2 dz\right)^{\frac{1}{2}}$ (using Schwartz inequality)

$\leq \frac{a^2 R_S}{|\sigma||\sigma_i|{P_s}^2}\int_0^1 |w|^2 dz$. (utilizing inequality (33)) (47)

Thus using inequalities (45), (46) and (47) in Eq. (40), we finally, get

$$\frac{1}{\varepsilon}\int_0^1 |Dw|^2 dz + a^2\left(\frac{1}{\varepsilon} - \frac{R_a M_1(1-M_5)}{P_r|\sigma||\sigma_i|} - \frac{R_s M_1'\left|1-\frac{1}{M_5}\right|}{P_s|\sigma||\sigma_i|} - \frac{R_s\left[1-M_1'\left(1-\frac{1}{M_5}\right)\right]}{|\sigma||\sigma_i|P_s}\right)\int_0^1 |w|^2 dz +$$
$$[1+M_1(1-M_5)]P_r\int_0^1 |\theta|^2\, dz \leq 0,$$

which implies that

$$|\sigma|^2\sigma_i^2 < \varepsilon^2\left\{\frac{R_a M_1(1-M_5)}{P_r} + \frac{R_s}{P_s}\left(1+M_1'\left|1-\frac{1}{M_5}\right| - M_1'\left(1-\frac{1}{M_5}\right)\right)\right\}^2, \quad (48)$$

Above theorem may be stated, from the physical point of view, as: the complex growth rate of an arbitrary oscillatory disturbance of neutral or growing amplitude in ferrothermosolutal convection in a densely packed porous medium must lie inside the region represented by inequality (61). This result is valid when both the boundaries are rigid.

Note: It is worth to point out here that for most of the ferrofluids, which are formed by changing ferric oxides and carrier organic fluids (e. g. kerosene, alcohol and hydrocarbon etc.), the parametric value M_5 varies between 0.1 and 0.5 (Finlayson [4] and Gupta and Gupta [5]), so that the condition $1 - M_5 > 0$ and hence $1 - \frac{1}{M_5} < 0$ remains valid.

4. Conclusion

The present problem under consideration has been investigated by using the linear stability theory. The upper limits for the complex growth rates in ferrothermosolutal convection in a densely packed porous medium heated and salted from below has been obtained by using Darcy model. These results are important especially when at least one of the boundaries is rigid so that exact solutions in the closed form are not obtainable. The present investigations can present theoretical support to experimentalists.

ABSTRACT

It is proved analytically that the complex growth rate $\omega = \omega_r + i\omega_i$ (ω_r and ω_i are respectively the real and imaginary parts of ω) of an arbitrary oscillatory motion of growing amplitude in ferrothermohaline convection with magnetic-field-dependent viscosity in a densely packed porous medium for the case of free boundaries lies inside a semicircle in the right half of the $\omega_r\omega_i$ plane whose center is at the origin and radius = $\sqrt{\varepsilon R_S}\,[1 - M'_1(1 - 1/M_5)]/P_s$, where R_S is the concentration Rayleigh number, ε is the porosity of the medium, P_s is the solutal Prandtl number, M'_1 is the ratio of magnetic flux due to concentration fluctuation to the gravitational force, and M_5 is the ratio of concentration effect on magnetic field to pyromagnetic coefficient. Bounds for the case of rigid boundaries are also derived separately.

KEY WORDS: ferrofluid, ferrothermohaline convection, magnetic-field-dependent viscosity, Darcy mode

Abstract The traces of powers of matrices frequently arise in several fields of mathematics. Rhotrices are a new paradigm of matrices which are represented as coupled matrices. The main aim of this paper is to find the trace of positive integral powers of three and five dimensional rhotrices. Further, the trace of positive integral powers of special type of circulant rhotrix is also discussed.

Key words Rhotrix, trace of a rhotrix, determinant, circulant rhotrix.

2020 Mathematics Subject Classification 15A09, 20H30, 11T71.

1 Introduction

The trace of a positive integer power of a matrix needs to be evaluated in various problems in Network Analysis, Number Theory, Matrix Theory, Dynamical Systems and Differential Equations. To study a complex network, we need to compute the total number of triangles of a connected simple graph. The trace of integral powers of square matrices was discussed by Michiel [6] and Pahade and Jha [7]. Cisneros et al. [4] and Cisneros [5] discussed a formula for the trace of symmetric powers of a matrix. Also, Brezinski et al. [3] estimated the trace of powers of self adjoint operators. Zareula [14] discussed the congruences for the trace of powers of some matrices.
Rhotrix is a new paradigm in the study of matrix theory. Rhotrix is represented as coupled matrix. Ajibade [2] defined a 3–dimensional rhotrix, which is, in some way, between 2×2–dimensional and 3×3–dimensional matrices as

$$R_3 = \left\langle \begin{array}{ccc} & a & \\ b & c & d \\ & e & \end{array} \right\rangle,$$

where a, b, c, d, e are real numbers and $h(R_3) = c$ is called the heart of rhotrix R_3.

Let $Q_3 = \left\langle \begin{array}{ccc} & f & \\ g & h & j \\ & k & \end{array} \right\rangle$, be another 3-dimensional rhotrix, then the addition of two rhotrices is defined as

$$R_3 + Q_3 = \left\langle \begin{array}{ccc} & a & \\ b & c & d \\ & e & \end{array} \right\rangle + \left\langle \begin{array}{ccc} & f & \\ g & h & j \\ & k & \end{array} \right\rangle = \left\langle \begin{array}{ccc} & a+f & \\ b+g & c+h & d+j \\ & e+k & \end{array} \right\rangle,$$

and for any real number α, the scalar multiplication of a rhotrix R_3 by α is defined as

$$\alpha\, R_3 = \alpha \left\langle \begin{array}{ccc} & a & \\ b & c & d \\ & e & \end{array} \right\rangle = \left\langle \begin{array}{ccc} & \alpha\, a & \\ \alpha\, b & \alpha\, c & \alpha\, d \\ & \alpha\, e & \end{array} \right\rangle.$$

Two types of multiplications of rhotrices are discussed in the literature of rhotrices, namely, the heart oriented multiplication and the row-column multiplication. Ajibade [2] discussed the heart oriented multiplication of 3-dimensional rhotrices as given below:

Let $Q_3 = \left\langle \begin{array}{ccc} & f & \\ g & h & j \\ & k & \end{array} \right\rangle$,be another 3-dimensional rhotrix, then the multiplication of two rhotrices is defined as

$$R_3\, o\; Q_3 = \left\langle \begin{array}{ccc} & ah+fc & \\ bh+gc & ch & dh+jc \\ & eh+kc & \end{array} \right\rangle.$$

Further, Absalom et al. [1] generalized the heart oriented multiplication of 3-dimensional rhotrices to n-dimensional rhotrices. The row column multiplication of 3-dimensional rhotrices is defined by Sani [8] as

$$R_3\, o\, Q_3 = \left\langle \begin{array}{ccc} & a & \\ b & c & d \\ & e & \end{array} \right\rangle \left\langle \begin{array}{ccc} & f & \\ g & h & j \\ & k & \end{array} \right\rangle = \left\langle \begin{array}{ccc} & af+dg & \\ bf+eg & ch & aj+dk \\ & bj+ek & \end{array} \right\rangle.$$

Sani [9] also discussed the row-column multiplication of high dimension rhotrices as follows: Consider an n-dimensional rhotrix

$$P_n = \left\langle \begin{array}{ccccccc} & & & a_{11} & & & \\ & & a_{21} & c_{11} & a_{12} & & \\ & a_{31} & c_{21} & a_{22} & c_{12} & a_{13} & \\ \cdots & \cdots & \cdots & \cdots & \cdots & \cdots & \cdots \\ a_{t1} & \cdots & \cdots & \cdots & \cdots & \cdots & a_{1t} \\ \cdots & \cdots & \cdots & \cdots & \cdots & \cdots & \cdots \\ & a_{tt-2} & c_{t-1t-2} & a_{t-1t-1} & c_{t-2t-1} & a_{t-2t} & \\ & & a_{tt-1} & c_{t-1t-1} & a_{t-1t} & & \\ & & & a_{tt} & & & \end{array} \right\rangle,$$

where $t = (n+1)/2$. Sani [10] represented rhotrix as a coupled matrix and denoted it as $P_n = \langle a_{ij},\ c_{lk} \rangle = \langle A, C \rangle$ with $i, j = 1, 2, ..., t$ and $l, k = 1, 2, ..., t-1$. The multiplication of two rhotrices P_n and Q_n defined by Sani [9] is as follows:

$$P_n\, o\, Q_n = \langle a_{i_1 j_1},\, c_{l_1 k_1} \rangle\; o\; \langle b_{i_2 j_2},\, d_{l_2 k_2} \rangle = \left\langle \sum_{i_2 j_1 = 1}^{t} (a_{i_1 j_1}\, b_{i_2 j_2}),\ \sum_{l_2 k_1 = 1}^{t-1} (c_{l_1 k_1}\, d_{l_2 k_2}) \right\rangle.$$

Sharma and Kanwar [11, 12] defined the trace of a rhotrix and discussed its properties. Sharma et al. [13] introduced circulant rhotrices in the literature of rhotrices.

Definition 1.1. [11] Let

$$R_n = \left\langle \begin{array}{ccccccccc} & & & & a_{11} & & & & \\ & & & a_{21} & c_{11} & a_{12} & & & \\ & & a_{31} & c_{21} & a_{22} & c_{12} & a_{13} & & \\ & .. & .. & .. & .. & .. & .. & .. & \\ a_{t1} & c_{t-11} & .. & .. & .. & .. & .. & c_{1t-1} & a_{1t} \\ & .. & .. & .. & .. & .. & .. & .. & \\ & & a_{t\,t-2} & c_{t-1t-2} & a_{t-1t-1} & c_{t-2t-1} & a_{t-2t} & & \\ & & & a_{t\,t-1} & c_{t-1t-1} & a_{t-1t} & & & \\ & & & & a_{tt} & & & & \end{array} \right\rangle$$

$$= \langle a_{i\,j},\ c_{l\,k} \rangle = \langle A,\ C \rangle\ ,$$

be a rhotrix, where $a_{i\,j},\ c_{l\,k} \in \mathbb{R}$, $1 \leq i, j \leq t$, $1 \leq l, k \leq t-1$ and $t = \frac{n+1}{2}$.
The trace of R_n is defined as

$$\begin{aligned} Tr\ R_n &= \sum_{i=1}^{t} a_{ii} + \sum_{i=1}^{t-1} c_{ii} \\ &= Tr\ A + Tr\ C \\ &= \sum_{r=1}^{t} x_{rs} \end{aligned}$$

That is, the trace of a rhotrix R_n, which is the sum of all its elements of the vertical diagonal, where $R_n = \langle x_{r\,s} \rangle$ is the general representation to the n–dimensional rhotrix. The elements $x_{r\,s}$ for $r = s\,(r \neq s)$ represent the vertical (non–vertical) diagonal entries of the rhotrix R_n.

2 Trace of positive integral powers of a three dimensional rhotrix

In this section, we put forward a result to evaluate the trace of any positive integral power of a three dimensional rhotrix.

Theorem 2.1. *Let $R_3 =< A, B >$ be a three dimensional rhotrix whose coupled matrices are $A = (a_{ij})_{2\times 2}$ and $B = (c)_{1\times 1}$. Then, the trace of R_3^n, where n is positive even integer, is given by:*

$$TrR_3^n = (TrA)^n - n.|A|.(TrA)^{n-2} + \frac{n\,(n-3)}{2!}.|A|^2.(TrA)^{n-4} - \frac{n\,(n-4)\,(n-5)}{3!}.|A|^3.(TrA)^{n-6} +$$
$$\ldots + (-1)^{\frac{n}{2}} \frac{n\left(n-\frac{n}{2}-1\right)\left(n-\frac{n}{2}-2\right)\ldots . up\ to\ \frac{n}{2}\ terms}{\left(\frac{n}{2}\right)!}.|A|^{\frac{n}{2}}\,(TrA)^{n-2\cdot\frac{n}{2}} + (TrB)^n.$$

Proof. Consider a three dimensional rhotrix

$$R_3 = \left\langle \begin{array}{ccc} & a & \\ b & c & d \\ & e & \end{array} \right\rangle,$$

where a, b, c, d, e are real numbers and the coupled matrices are given as $A = \begin{bmatrix} a & d \\ b & e \end{bmatrix}$ and $B = [c]$.
Then, $|A| = ae - bd$ and $Tr\ A = a + e$.

$$A^2 = \begin{bmatrix} a^2 + bd & d(a+e) \\ b(a+e) & bd + e^2 \end{bmatrix}$$

and

$$\begin{aligned} Tr\ A^2 &= a^2 + 2bd + e^2 = a^2 + 2ae + e^2 - 2ae + 2bd \\ &= (a+e)^2 - 2(ae - bd) \end{aligned}$$

or,

$$TrA^2 = (TrA)^2 - 2.\,|A|\,. \tag{2.1}$$

Similarly,

$$A^3 = \begin{bmatrix} a^3 + abd + bd(a+e) & a^2d + d^2b + ed(a+e) \\ ab\,(a+e) + b^2d + e^2b & bd\,(a+e) + dbe + e^3 \end{bmatrix}$$

and

$$Tr\ A^3 = a^3 + e^3 + 3bd(a+e) = (a+e)^3 - 3(a+e)(ae - bd)$$

or,

$$TrA^3 = (TrA)^3 - 3.\,|A|\,.\,Tr\ A. \tag{2.2}$$

Replacing A by A^2 in (2.1), we get

$$Tr\ (A^2)^2 = \left(TrA^2\right)^2 - 2.\,|A^2|$$
$$= ((TrA)^2 - 2.\,|A|)^2 - 2(|A|)^2$$

or,

$$TrA^4 = (TrA)^4 - 4.\,|A|\,.(TrA)^2 + \frac{4(4-3)}{2!}.|A|^2.(TrA)^{4-2.\frac{4}{2}}$$

Also, replacing A by A^2 in (2.2), we get

$$Tr\ A^6 = Tr\ (A^2)^3 = \left(TrA^2\right)^3 - 3.\,|A^2|\,.\,TrA^2$$

$$= ((TrA)^2 - 2.\,|A|)^3 - 3.(|A|)^2((Tr\ A)^2 - 2.\,|A|)$$
$$= (TrA)^6 - 8.|A|^3 - 6.\,|A|\,.(TrA)^4 + 12|A|^2.\ (TrA)^2 - 3.(|A|)^2(Tr\ A)^2 + 6.(|A|)^3$$
$$TrA^6 = (TrA)^6 - 6.\,|A|\,.(TrA)^4 + \frac{6\,(6-3)}{2!}.|A|^2.\ (TrA)^2 - \frac{6\,(6-4)\,(6-5)}{3!}.|A|^3.\ (TrA)^{6-2.\frac{6}{2}}.$$

Thus, when n is an even integer, then

$$TrA^n = (TrA)^n - n.|A|.(TrA)^{n-2} + \frac{n\,(n-3)}{2!}.|A|^2.(TrA)^{n-4} - \frac{n\,(n-4)\,(n-5)}{3!}.|A|^3.(TrA)^{n-6} +$$
$$\ldots + (-1)^{\frac{n}{2}}\frac{n\left(n-\frac{n}{2}-1\right)\left(n-\frac{n}{2}-2\right)\ldots \text{up to } \frac{n}{2} \text{ terms}}{\left(\frac{n}{2}\right)!}.|A|^{\frac{n}{2}}(TrA)^{n-2.\frac{n}{2}}.$$

Also,

$$Tr\ B^n = c^n$$

By Definition 1.1 we know that

$$Tr\ R_3 = Tr\ A + Tr\ B.$$

Therefore,

$$TrR_3^n = Tr\ A^n + Tr\ B^n.$$

Hence,

$$TrR_3^n = \sum\nolimits_{k=0}^{n/2} \frac{(-1)^k}{k!} \cdot (n(n-k-1)(n-k-2)\ldots \text{up to } k \text{ terms}) \cdot |A|^k (TrA)^{(n-2k)} + c^n$$

where n is an even integer.

□

Example 2.2. Let

$$R_3 = \left\langle \begin{matrix} & 1 & \\ 2 & 1 & -1 \\ & 2 & \end{matrix} \right\rangle$$

be a three dimensional rhotrix such that its coupled matrices are $A = \begin{bmatrix} 1 & -1 \\ 2 & 2 \end{bmatrix}$ and $B = [1]$. Then, $Tr\ A = 3$ and $|A| = 4$ and $Tr\ B = 1$. Now,

$$Tr\ A^{10} = \sum_{k=0}^{5} \frac{(-1)^k}{k!}(n\,(n-k-1)\,(n-k-2)\ldots \text{up to } k \text{ terms}).|A|^k (TrA)^{n-2k}$$

$$= (TrA)^{10} - 10.|A|.(TrA)^8 + \frac{10.7}{2!}.|A|^2.(TrA)^6 - \frac{10.6.5}{3!}.|A|^3(TrA)^4 + \frac{10.5.4.3}{4!}.|A|^4(TrA)^2 - \frac{10.4.3.2.1}{5!}.|A|^5$$

$$= (3)^{10} - 10.4.(3)^8 + 35.(4)^2.(3)^6 - 50.(4)^3.(3)^4 + 25.(4)^4.(3)^2 - 2(4)^5 = 1201$$

and $Tr\ B^{10} = 1$. Therefore, ${R_3}^{10} = 1201 + 1 = 1202$.

Theorem 2.3. *Let $R_3 =< A, B >$ be a three dimensional rhotrix whose coupled matrices are $A = (a_{ij})_{2\times 2}$ and $B = (c)_{1\times 1}$ .Then, the trace of R_3^n where, n is a positive odd integer, is given by*

$$TrR_3^n = \sum_{k=0}^{\frac{n-1}{2}} \frac{(-1)^k}{k!} \cdot (n(n-k-1)(n-k-2)\dots \text{up to } k \text{ terms}) \cdot |A|^k \cdot (TrA)^{n-2k} + (TrB)^n$$

where $|A| = \det A$.

Proof. Consider a three dimensional rhotrix

$$R_3 = \left\langle \begin{array}{ccc} & a & \\ b & c & d \\ & e & \end{array} \right\rangle$$

where a, b, c, d, e are real numbers and the coupled matrices are given by $A = \begin{bmatrix} a & d \\ b & e \end{bmatrix}$ and $B = [c]$.

Then, from the Theorem 2.1 TrA^3 is given by

$$TrA^3 = (TrA)^3 - 3.|A|.Tr\ A$$

$$= (TrA)^{3-2.0} + \frac{(-1)^1}{1!}.|A|^1.(Tr\ A)^{3-2.1}.$$

Similarly,

$$A^5 = A^3.A^2$$

$$= \begin{bmatrix} a^3 + abd + bd(a+e) & a^2d + d^2b + ed(a+e) \\ ab(a+e) + b^2d + e^2b & bd(a+e) + dbe + e^3 \end{bmatrix} \begin{bmatrix} a^2 + bd & d(a+e) \\ b(a+e) & bd + e^2 \end{bmatrix}$$

Now,

$$TrA^5 = a^5 + a^3bd + 2a^2bd(a+e) + a^3bd + ab^2d^2 + 4b^2d^2(a+e) + ebd(a+e)^2$$
$$+ abd(a+e)^2 + 2e^2bd(a+e) + eb^2d^2 + 2e^3bd$$
$$= (a+e)^5 - 5.(ae-bd).(a+e)^3 + 5(ae-bd)^2.(a+e)$$
$$= (TrA)^5 - 5.|A|.(TrA)^3 + \frac{5(5-3)}{2!}.|A|^2.(Tr\ A)$$
$$= (TrA)^{5-2.0} + \frac{(-1)^1}{1!}.5.|A|^1.(TrA)^{5-2.1} + \frac{(-1)^2}{2!}5(5-3).|A|^2.(Tr\ A)^{5-2.2}$$

Thus, when n is an odd integer, then

$$TrA^n = \sum_{k=0}^{\frac{n-1}{2}} \frac{(-1)^k}{k!} \cdot (n(n-k-1)(n-k-2)\dots \text{ up to } k \text{ terms}) \cdot |A|^k (TrA)^{n-2k}.$$

Also,

$$Tr\ B^n = c^n.$$

Sharma and Kanwar [11] showed that the trace of a rhotrix is given by,

$$Tr\ R_3 = Tr\ A + Tr\ B.$$

Therefore,

$$TrR_3^n = Tr\ A^n + Tr\ B^n.$$

Hence,

$$TrR_3^n = \sum_{k=0}^{\frac{n-1}{2}} \frac{(-1)^k}{k!} \cdot (n(n-k-1)(n-k-2)\dots \text{up to } k \text{ terms}) \cdot |A|^k (TrA)^{n-2k} + c^n$$

where n is an odd positive integer.

□

Example 2.4. Let

$$R_3 = \left\langle \begin{array}{ccc} & 1 & \\ 2 & 1 & -1 \\ & 2 & \end{array} \right\rangle$$

be a three dimensional rhotrix such that its coupled matrices are $A = \begin{bmatrix} 1 & -1 \\ 2 & 2 \end{bmatrix}$ and $B = [1]$. Then, $Tr\ A = 3$ and $|A| = 4$ and $Tr\ B = 1$. Now,

$$Tr\ A^9 = \sum_{k=0}^{4} \frac{(-1)^k}{k!} \cdot (n\,(n-k-1)\,(n-k-2)\ldots \text{up to } k \text{ terms}) \cdot |A|^k (TrA)^{n-2k}$$

$$= (TrA)^9 - 9.\,|A|\,.\,(TrA)^7 + \frac{9.7}{2!}.|A|^2.(TrA)^5 - \frac{9.5.4}{3!}.\,|A|^3(TrA)^3 + \frac{9.4.3}{4!}.|A|^4\ .TrA$$

$$= (3)^9 - 9.4.\ (3)^7 + \frac{63}{2}.\,(4)^2.\ (3)^5 - 30.(4)^3.\,(3)^3 + \frac{9}{2}.\ (4)^4.3 = 15039$$

and $Tr\ B^{10} = 1$. Therefore,

$$Tr\ {R_3}^{10} = 15039 + 1 = 15040.$$

3 Trace of positive integral powers of a five dimensional rhotrix

In this section, we put forward a result to evaluate the trace of any positive power of a five dimensional rhotrix.

Theorem 3.1. *Let $R_5 =< A, B >$ be a five dimensional rhotrix whose coupled matrices are $A = (a_{ij})_{3\times 3}$ and $B = (b_{ij})_{2\times 2}$. Then, the trace of R_5^n where n is a positive even integer is given by*

$$Tr\ R_5^n$$
$$= \sum\nolimits_{r_1=0}^{\lfloor \frac{n}{3} \rfloor} \left[\sum\nolimits_{r_0=0}^{\lfloor \frac{n-3r_1}{2} \rfloor} \frac{(-1)^{r_0}}{r_0!} [n\,(n-r_0-2r_1-1)\,(n-r_0-2r_1-2)\ldots(n-2r_0-3r_1+1)] \times \right.$$
$$\left. (TrA)^{n-2r_0-3r_1}.A_2^{r_0} \right] \frac{(|A|)^{r_1}}{r_1!} + \sum\nolimits_{k=0}^{\frac{n}{2}} \frac{(-1)^k}{k!} \cdot (n\,(n-k-1)\,(n-k-2)\ldots(up\ to\ k\ terms)) \times$$
$$|B|^k (TrB)^{n-2k}$$

and the trace of R_5^n when n is positive odd integer, is given by

$$Tr\ R_5^n$$
$$= \sum\nolimits_{r_1=0}^{\lfloor \frac{n}{3} \rfloor} \left[\sum\nolimits_{r_0=0}^{\lfloor \frac{n-3r_1}{2} \rfloor} \frac{(-1)^{r_0}}{r_0!} [n\,(n-r_0-2r_1-1)\,(n-r_0-2r_1-2)\ldots(n-2r_0-3r_1+1)] \times \right.$$
$$\left. (TrA)^{n-2r_0-3r_1}.A_2^{r_0} \right] \frac{(|A|)^{r_1}}{r_1!} + \sum\nolimits_{k=0}^{\frac{n-1}{2}} \frac{(-1)^k}{k!} \cdot (n\,(n-k-1)\,(n-k-2)\ldots(up\ to\ k\ terms)) \times$$
$$|B|^k (TrB)^{n-2k}$$

where A_2 is the sum of all principal minors of order 2 in A, r_0 is the number of principal minor of order 1, r_1 is the number of principal minors of order 2, $\lfloor x \rfloor$ is the floor function, $|A| = \det A$ and $|B| = \det B$.

Proof. Let $R_5 = \left\langle \begin{array}{ccccc} & & a & & \\ & d & p & b & \\ g & r & e & q & c \\ & h & s & f & \\ & & i & & \end{array} \right\rangle$ be a five dimensional rhotrix whose coupled matrices are

$A = \begin{bmatrix} a & b & c \\ d & e & f \\ g & h & i \end{bmatrix}$ and $B = \begin{bmatrix} p & q \\ r & s \end{bmatrix}$. As stated earlier, $TrR_5 = TrA + TrB$ and $TrR_5^n = TrA^n + TrB^n$. Since of B is a matrix order 2×2, therefore, the trace of B^n can be written directly from the

Theorem 2.1 and the Theorem 2.3. To get the trace of R_5^n, we need to evaluate the trace of A^n. Now, as

$$|A| = a\,(ei - hf) - b\,(di - gf) + +c\,(dh - eg)$$

and $Tr\ A = a + e + i$, therefore,

$$TrA^2 = (a + e + i)^2 - 2\,(ae - bd + ei - fh + ai - cg)$$
$$= (TrA)^2 - 2\sum_{i=1}^{3} |A_{ii}|,$$

where $|A_{ii}|$ are the principal minors of order 2 given as $|A_{11}| = \begin{vmatrix} a & b \\ d & e \end{vmatrix}$, $|A_{22}| = \begin{vmatrix} e & f \\ g & h \end{vmatrix}$, $|A_{33}| = \begin{vmatrix} a & c \\ g & i \end{vmatrix}$.

Therefore, if we put

$$A_2 = \sum_{i=1}^{3} |A_{ii}|$$

then

$$TrA^2 = (TrA)^2 - 2A_2.$$

Also,

$$\begin{aligned} TrA^4 &= a^4 + 2b^2d^2 + e^4 + 2c^2g^2 + 4a^2\,(bd + cg) + 4cdeh + 4e^2fh + 4cfgh \\ &\quad + 2f^2h^2 + cdhi + 4efhi + 4cgi^2 + 4fhi^2 + i^4 + 4a\,(bde + bfg + cdh + cgi) \\ &\quad + 4b\,\left(d\left(e^2 + cg + fh\right) + fg(e + i)\right) \\ &= (a + e + i)^4 - 4(a + e + i)^2\,(-bd + ae - cg - fh + ai + ei) \\ &\qquad + 2(-bd + ae - cg - fh + ai + ei)^2 \\ &\qquad + 4(a + e + i)(-ceg + bfg + cdh - afh - bdi + aei) \\ &= (TrA)^4 - 4\sum_{i=1}^{3} |A_{ii}|.TrA + 2(\sum_{i=1}^{3} |A_{ii}|)^{\ 2} + 4.TrA.\ |A| \\ &= (TrA)^4 - 4A_2.TrA + 2(A_2)^2 + 4.TrA.\ |A|\,. \end{aligned}$$

Similarly,

$$TrA^5 = (TrA)^5 - 5A_2.(TrA)^3 + 5\ TrA.(A_2)^2 + 5\ (TrA)^2.\ |A| - 5.A_2.\,|A|\,.$$

Therefore, TrA^n can be generalized as

$$\begin{aligned} &Tr\ A^n \\ &= \sum\nolimits_{r_1=0}^{\lfloor \frac{n}{3} \rfloor} \left[\sum\nolimits_{r_0=0}^{\lfloor \frac{n-3r_1}{2} \rfloor} \frac{(-1)^{r_0}}{r_0!} \left[n\,(n - r_0 - 2r_1 - 1)\,(n - r_0 - 2r_1 - 2)\ldots(n - 2r_0 - 3r_1 + 1)\right] \times \right. \\ &\left. (TrA)^{n-2r_0-3r_1}.A_2^{r_0} \right] \frac{(|A|)^{r_1}}{r_1!} \end{aligned}$$

For even positive integer n and using Theorem 2.1, we have

$$Tr\ B^n = \sum\nolimits_{k=0}^{\frac{n}{2}} \frac{(-1)^k}{k!} \cdot (n\,(n - k - 1)\,(n - k - 2)\ldots(\text{up to } k \text{ terms})) \cdot |B|^k (TrB)^{n-2k}$$

Therefore, $TrR_5^n = Tr\ A^n + Tr\ B^n$. Now,

$$\begin{aligned} &Tr\ R_5^n \\ &= \sum\nolimits_{r_1=0}^{\lfloor \frac{n}{3} \rfloor} \left[\sum\nolimits_{r_0=0}^{\lfloor \frac{n-3r_1}{2} \rfloor} \frac{(-1)^{r_0}}{r_0!} \left[n\,(n - r_0 - 2r_1 - 1)\,(n - r_0 - 2r_1 - 2)\ldots(n - 2r_0 - 3r_1 + 1)\right] \times \right. \\ &\left. (TrA)^{n-2r_0-3r_1}.A_2^{r_0} \right] \frac{(|A|)^{r_1}}{r_1!} + \sum\nolimits_{k=0}^{\frac{n}{2}} \frac{(-1)^k}{k!} \cdot (n\,(n - k - 1)\,(n - k - 2)\ldots(\text{up to } k \text{ terms})) \times \\ &|B|^k (TrB)^{n-2k} \end{aligned}$$

Also, $R_5^n = Tr\ A^n + Tr\ B^n$, for odd n, this gives

$$Tr\ R_5^n$$
$$= \sum_{r_1=0}^{\lfloor \frac{n}{3} \rfloor} \left[\sum_{r_0=0}^{\lfloor \frac{n-3r_1}{2} \rfloor} \frac{(-1)^{r_0}}{r_0!} \left[n\,(n-r_0-2r_1-1)\,(n-r_0-2r_1-2)\ldots(n-2r_0-3r_1+1) \right] \times \right.$$
$$\left. (TrA)^{n-2r_0-3r_1}.A_2^{r_0} \right] \frac{(|A|)^{r_1}}{r_1!} + \sum_{k=0}^{\frac{n-1}{2}} \frac{(-1)^k}{k!} \cdot (n\,(n-k-1)\,(n-k-2)\ldots(\text{up to } k \text{ terms})) \times$$
$$|B|^k (TrB)^{n-2k}$$

□

4 Trace of a special type of n-dimensional circulant rhotrix

Now we prove below a theorem for the trace of a special type of n-dimensional circulant rhotrix.

Theorem 4.1. *Let $R_n = \langle A_t, B_{t-1} \rangle$ be an $n-$dimensional special circulant rhotrix whose diagonal entries are zero and all other entries are one. A_t, B_{t-1} are the coupled matrices of R_n, where $t = \frac{n+1}{2}, A_t = (a_{ij})$, $1 \leq i,j \leq t$ and $B_{t-1} = (b_{ij})$, $1 \leq i,j \leq t-1$ such that $a_{ij} = \begin{cases} 0, & \text{if } i=j \\ 1, & \text{if } i \neq j \end{cases}$ and $b_{ij} = \begin{cases} 0, & \text{if } i=j \\ 1, & \text{if } i \neq j \end{cases}$. Then, the trace of positive powers of R_n, when r is a positive even integer, is given by*

$$Tr\ R_n^r = \sum_{m=1}^{\frac{r}{2}} N(t,m) t(t-1)^m (t-2)^{r-2m} + \sum_{m=1}^{\frac{r}{2}} N(t-1,m)\,(t-1)\,(t-2)^m (t-3)^{r-2m},$$

and the trace of positive powers of R_n, when r is a positive odd integer, is given by

$$Tr\ R_n^r = \sum_{m=1}^{\frac{r-1}{2}} N(t,m) t(t-1)^m (t-2)^{r-2m} + \sum_{m=1}^{\frac{r-1}{2}} N(t-1,m)\,(t-1)\,(t-2)^m (t-3)^{r-2m},$$

where, $N(k,1) = 1$, $N\left(k, \frac{k}{2}\right) = 1$, $N\left(k, \frac{k-1}{2}\right) = \frac{k-1}{2}$ and $N(k,\ r) = N(k-1,\ r) + N(k-2,\ r-1)$.

Proof. The rhotrix R_n is given by

$$R_n = \left\langle \begin{array}{ccccccc} & & & 0 & & & \\ & & 1 & 0 & 1 & & \\ & & & 1 & 0 & 1 & \ddots \\ 1 & \ldots & 1 & 0 & 1 & \ldots & 1 \\ & & \vdots & \vdots & \vdots & \vdots & \vdots \\ & & & 1 & 0 & 1 & \\ & & & & 0 & & \end{array} \right\rangle$$

whose coupled matrices for $t = \frac{n+1}{2}$ are A_t and B_{t-1} given as below:

$$A_t^2 = (a_{ij}) = \begin{cases} t-1, \text{ if } i=j \\ t-2, \text{ if } i \neq j \end{cases} \quad \text{and} \quad B_{t-1}^2 = (b_{ij}) = \begin{cases} t-2, \text{ if } i=j \\ t-3, \text{ if } i \neq j. \end{cases}$$

Therefore,

$$Tr\ A_t^2 = t(t-1) \ \text{ and } \ Tr\ B_{t-1}^2 = (t-1)\,(t-2)\,. \tag{4.1}$$

That is,

$$Tr\ A_t^2 = \sum_{m=1}^{\frac{r}{2}=1} N\,(2,1)\,t(t-1) \ \text{ and } \ B_{t-1}^2 = \sum_{m=1}^{\frac{r}{2}=1} N\,(2,1)\,(t-1)(t-2).$$

Hence,

$$Tr\ R_n^2 = Tr\ A_t^2 + Tr\ B_{t-1}^2 = \sum_{m=1}^{\frac{r}{2}=1} N(2,m)\, t(t-1) + \sum_{m=1}^{\frac{r}{2}=1} N(2,m)\,(t-1)(t-2).$$

Similarly,

$$A_t^3 = (a_{ij}) = \begin{cases} (t-1)(t-2), \text{ if } i=j \\ (t-1)+(t-2)^2, \text{ if } i\neq j \end{cases} \quad \text{and} \quad B_{t-1}^3 = (b_{ij}) = \begin{cases} (t-2)(t-3), \text{ if } i=j \\ (t-2)+(t-3)^2, \text{ if } i\neq j, \end{cases}$$

which gives,

$$Tr\ A_t^3 = t(t-1)(t-2) \ \text{ and } \ Tr\ B_{t-1}^3 = (t-1)\,(t-2)\,(t-3). \tag{4.2}$$

That is,

$$TrA_t^3 = \sum\nolimits_{m=1}^{\frac{r-1}{2}=1} N(3,m)\, t(t-1)(t-2) \quad \text{and} \quad TrB_{t-1}^3 = \sum\nolimits_{m=1}^{\frac{r-1}{2}=1} N(3,m)\,(t-1)(t-2)(t-3),$$

which gives,

$$Tr\ R_n^3 = Tr\ A_t^3 + Tr\ B_{t-1}^3 \ = \sum_{m=1}^{\frac{r-1}{2}=1} N(3,m)\, t(t-1)(t-2) + \sum_{m=1}^{\frac{r-1}{2}=1} N(3,m)\,(t-1)(t-2)(t-3).$$

Now,

$$A_t^4 = (a_{ij}) = \begin{cases} (t-1)\ \ [(t-1)+(t-2)^2], \ \text{ if } \ i=j \\ (t-1)\,(t-2)+(t-2)\,[(t-1)+(t-2)^2], \ \text{ if } \ i\neq j \end{cases}$$

and

$$B_{t-1}^4 = (b_{ij}) = \begin{cases} (t-2)\ \ [(t-2)+(t-3)^2], \ \text{ if } \ i=j \\ (t-2)\,(t-3)+(t-3)\,[(t-2)+(t-3)^2], \ \text{ if } \ i\neq j \end{cases}$$

which lends

$$Tr\ A_t^4 = t(t-1)^2 + t(t-1)(t-2)^2 \quad \text{and} \quad Tr\ B_{t-1}^4 = (t-1)(t-2)^2 + (t-1)(t-2)(t-3)^2. \tag{4.3}$$

That is,

$$TrA_t^4 = \sum_{m=1}^{\frac{r}{2}=2} N(4,m)\, t(t-1)^m (t-2)^{4-2m} \quad \text{and} \quad TrB_t^4 = \sum_{m=1}^{\frac{r}{2}=2} N(4,m)\,(t-1)\,(t-2)^m (t-3)^{4-2m}$$

which gives,

$$Tr\ R_n^4 = Tr\ A_t^4 + Tr\ B_{t-1}^4 \ = \sum_{m=1}^{\frac{r}{2}=2} N(4,m)\, t(t-1)^m (t-2)^{4-2m} + \sum_{m=1}^{\frac{r}{2}=2} N(4,m)\,(t-1)(t-2)^m (t-3)^{4-2m}.$$

Now,

$$A_t^5 = (a_{ij}) = \begin{cases} 2(t-1)^2\,(t-2) + (t-1)(t-2)^3, \ \text{ if } \ i=j \\ (t-1)^2 + 3\,(t-1)\,(t-2)^2 + (t-2)^4], \ \text{ if } \ i\neq j \end{cases}$$

and

$$B_{t-1}^5 = (b_{ij}) = \begin{cases} 2(t-2)^2\,(t-3) + (t-2)(t-3)^3, \ \text{ if } \ i=j \\ (t-2)^2 + 3\,(t-2)\,(t-3)^2 + (t-3)^4], \ \text{ if } \ i\neq j, \end{cases}$$

which gives,

$$Tr\ A_t^5 = 2t(t-1)^2(t-2) + t(t-1)(t-2)^3 \quad \text{and} \quad Tr\ B_{t-1}^5 = 2\,(t-1)\,(t-2)^2\,(t-3) + (t-1)(t-2)(t-3)^3. \tag{4.4}$$

That is,

$$TrA_t^5 = \sum_{m=1}^{\frac{r}{2}=2} N(5,m)\, t(t-1)^m (t-2)^{5-2m} \quad \text{and} \quad TrB_{t-1}^5 = \sum_{m=1}^{\frac{r}{2}=2} N(5,m)\,(t-1)(t-2)^m (t-3)^{5-2m}$$

from where follows that

$$Tr\ R_n^5 = Tr\ A_t^5 + Tr\ B_{t-1}^5 = \sum_{m=1}^{\frac{r}{2}=2} N\,(5,m)\,t(t-1)^m(t-2)^{5-2m} + \sum_{m=1}^{\frac{r}{2}=2} N\,(5,m)\,(t-1)(t-2)^m(t-3)^{5-2m}.$$

Thus, by induction, we conclude that

$$Tr\ R_n^r = \sum_{m=1}^{\frac{r}{2}} N(t,m)t(t-1)^m(t-2)^{r-2m} + \sum_{m=1}^{\frac{r}{2}} N(t-1,m)\,(t-1)\,(t-\ \ 2)^m(t-3)^{r-2m}$$

where, r is a positive even integer and

$$Tr\ R_n^r = \sum_{m=1}^{\frac{r-1}{2}} N(t,m)t(t-1)^m(t-2)^{r-2m} + \sum_{m=1}^{\frac{r-1}{2}} N(t-1,m)\,(t-1)\,(t-2)^m(t-3)^{r-2m}$$

where, r is a positive odd integer.

□

5 Conclusion

In this paper, we find the trace of positive integral powers of three and five dimensional rhotrices. Also, a result to find the traces of positive integral power of a special type of circulant rhotrix is derived.

Acknowledgments The authors thankfully acknowledge the support of the UGC-SAP and they also sincerely express their gratitude to the Editor-in-Chief of this Journal and the referees for their valuable suggestions for modifying this paper.

Circulant matrices, due to their wide range of applicability in computer sciences as well as their intrinsic properties make them particularly interesting for researchers. Circulant Rhotrices have been investigated in the recent researches for similar applications. After its introduction in 1936 Balanced incomplete block design (BIBD) which is an area of combinatorial mathematics, has been developed progressively afterwards. The studies regarding BIBDs have gained researchers' attention due to their fixed cross-correlation property, which makes them unique in communication system. The applicability of BIBDs can be seen in various areas such as error control coding, cryptography, code-division multiple-access networks, key distribution in sensor networks and watermarking; to name a few. Symmetric designs, among a variety of BIBDs, are often used as codes. Present work primarily focuses on developing symmetric balanced incomplete block design (BIBD) by using circulant rhotrices.

ABSTRACT
Maximum distance separable (MDS) matrices are important in cryptography and particularly used in block ciphers due to their properties of diffusion. Rhotrices are represented by the coupled matrices. Therefore, maximum distance separable rhotrices are of much interest in the context of cryptography. In this paper, we define Cauchy rhotrix and then use it to construct MDS rhotrices over finite fields.

Keywords
Cauchy rhotrix, Finite field, Maximum distance separable rhotrix, Circulant rhotrix, Vandermonde rhotrix.

1. INTRODUCTION
Ajibade [1] defined a 3×3–dimensional rhotrix, which is, in some way, between 2×2–dimensional and 3×3–dimensional matrices as

$$R_3 = \left\langle \begin{array}{ccc} & a & \\ b & c & d \\ & e & \end{array} \right\rangle,$$

where a,b,c,d,e are real numbers and $h(R_3) = c$ is called the heart of rhotrix R_3. He also defined the operations of addition and scalar multiplication as given below:

Let $Q_3 = \left\langle \begin{array}{ccc} & f & \\ g & h & j \\ & k & \end{array} \right\rangle$, be another 3-dimensional rhotrix, then the addition of two rhotrices is defined as

$$R_3 + Q_3 = \left\langle \begin{array}{ccc} & a & \\ b & c & d \\ & e & \end{array} \right\rangle + \left\langle \begin{array}{ccc} & f & \\ g & h & j \\ & k & \end{array} \right\rangle$$

$$= \left\langle \begin{array}{ccc} & a+f & \\ b+g & c+h & d+j \\ & e+k & \end{array} \right\rangle,$$

and for any real number α, the scalar multiplication of a rhotrix R_3 is defined as

$$\alpha R_3 = \alpha \left\langle \begin{array}{ccc} & a & \\ b & c & d \\ & e & \end{array} \right\rangle = \left\langle \begin{array}{ccc} & \alpha a & \\ \alpha b & \alpha c & \alpha d \\ & \alpha e & \end{array} \right\rangle.$$

Two types of multiplication of rhotrices are discussed in the literature of rhotrices, namely, heart oriented multiplication and row-column multiplication. Ajibade discussed the heart oriented multiplication of 3-dimensional rhotrices as given below:

$$R_3 \, o \, Q_3 = \left\langle \begin{array}{ccc} & ah + fc & \\ bh + gc & ch & dh + jc \\ & eh + kc & \end{array} \right\rangle.$$

Further, it is algorithmatized for computing machines by Mohammed et al. [2]. The extended heart oriented method for rhotrix multiplication is given by Mohammed [3] and also generalized the heart oriented multiplication of 3-dimensional rhotrices to n-dimensional rhotrices. The row column multiplication of 3-dimensional rhotrices is defined by Sani [4] as follows:

$$R_3 \, o Q_3 = \left\langle \begin{array}{ccc} & a & \\ b & c & d \\ & e & \end{array} \right\rangle \left\langle \begin{array}{ccc} & f & \\ g & h & j \\ & k & \end{array} \right\rangle$$

$$= \left\langle \begin{array}{ccc} & af + dg & \\ bf + eg & ch & aj + dk \\ & bj + ek & \end{array} \right\rangle.$$

Sani [5] also discussed the row-column multiplication of high dimension rhotrices as follows:

Consider a n -dimensional rhotrix

$$P_n = \left\langle \begin{array}{ccccccc} & & & a_{11} & & & \\ & & a_{21} & c_{11} & a_{12} & & \\ & a_{31} & c_{21} & a_{22} & c_{12} & a_{13} & \\ . & \cdots & \cdots & \cdots & \cdots & \cdots & \cdots \\ a_{t1} & \cdots & \cdots & \cdots & \cdots & \cdots & a_{1t} \\ \cdots & \cdots & \cdots & \cdots & \cdots & \cdots & \cdots \\ & a_{tt-2} & c_{t-1t-2} & a_{t-1t-1} & c_{t-2t-1} & a_{t-2t} & \\ & & a_{tt-1} & c_{t-1t-1} & a_{t-1t} & & \\ & & & a_{tt} & & & \end{array} \right\rangle,$$

where $t=(n+1)/2$ and denote it as $P_n=\langle a_{ij}, c_{lk}\rangle$ with $i,j=1,2,...,t$ and $l,k=1,2,...,t-1$. Then the multiplication of two rhotrices P_n and Q_n is defined as follows:

$$P_n \, o \, Q_n = \langle a_{i_1 j_1}, c_{l_1 k_1}\rangle o \langle b_{i_2 j_2}, d_{l_2 k_2}\rangle$$

$$= \left\langle \sum_{i_2 j_1=1}^{t} \left(a_{i_1 j_1} b_{i_2 j_2}\right), \sum_{l_2 k_1=1}^{t-1} \left(c_{l_1 k_1} d_{l_2 k_2}\right) \right\rangle.$$

Rhotrices over finite fields were discussed by Tudunkaya et al. [6]. Aminu [7, 8] investigated rhotrices over matrix theory and polynomials ring theory. Algebra and analysis of rhotrices is discussed in the literature, see [9, 10, 11]. Adjoint of a rhotrix, inner product spaces, bilinear forms and Caylay-Hamilton theorem are discussed by Sharma and Kanwar [12, 13, 14, 15, 16]. Different constructions of MDS rhotrices from companion matrices and Vandermonde matrices are given by Sharma et al. [17, 18, 19, 20, 21, 22, 23]. Sharma et al. [24] introduced circulant rhotrices in the literature of rhotrices and construct some MDS rhotrices using special type of circulant rhotrices, see [25].

Maximum distance separable (MDS) matrices have diffusion properties that are used in block ciphers and cryptographic hash functions, as discussed in [26, 27]. There are several methods to construct MDS matrices. Sajadieh et al. [28] and Lacan and Flimes [29] used Vandermonde matrices for the construction of MDS matrices. Gupta and Ray construct MDS rhotrices from companion matrices and circulant like matrices , see [30, 31]

Cauchy matrices have applications in coding theory such as in Goppa codes as discussed in [32]. Nakahara and Abraho [33] constructed an involutory MDS matrix of 16- order by using a Cauchy matrix which was used in MDS-AES design.

Definition 1.1. The matrix of the form $A=(a_{ij})_{mn}$ where

$$a_{ij}=\frac{1}{x_i-x_j},\ x_i-x_j\neq 0, 1\le i\le m, 1\le j\le n$$

is called a Cauchy matrix and x_i, x_j are the elements from F_{2^n}.

For example, a Cauchy matrix of n-order can be written as

$$A_n=\begin{bmatrix} \frac{1}{x_1-y_1} & \frac{1}{x_1-y_2} & \cdots & \frac{1}{x_1-y_n} \\ \frac{1}{x_2-y_1} & \frac{1}{x_2-y_2} & \cdots & \frac{1}{x_2-y_n} \\ \vdots & \vdots & \ddots & \vdots \\ \frac{1}{x_n-y_1} & \frac{1}{x_n-y_2} & \cdots & \frac{1}{x_n-y_n} \end{bmatrix}$$

In the present paper we denote the (i,j)th element of ith row and jth column by A[i][j].

Definition 1.2. A 5- dimensional Cauchy rhotrix C_5 is defined as

$$C_5=\left\langle \begin{matrix} & & \frac{1}{x_1-y_1} & & \\ & \frac{1}{x_2-y_1} & \frac{1}{s_1-t_1} & \frac{1}{x_1-y_2} & \\ \frac{1}{x_3-y_1} & \frac{1}{s_2-t_1} & \frac{1}{x_2-y_2} & \frac{1}{s_1-t_2} & \frac{1}{x_1-y_3} \\ & \frac{1}{x_3-y_2} & \frac{1}{s_2-t_2} & \frac{1}{x_2-y_3} & \\ & & \frac{1}{x_3-y_3} & & \end{matrix} \right\rangle,$$

where $x_i, y_j\ (i,j=1,2,3)$ and $s_l, t_m\ (l,m=1,2)$ are elements from a finite field. Two coupled matrices of C_5 are [35]

$$U=\begin{bmatrix} \frac{1}{x_1-y_1} & \frac{1}{x_1-y_2} & \frac{1}{x_1-y_3} \\ \frac{1}{x_2-y_1} & \frac{1}{x_2-y_2} & \frac{1}{x_2-y_3} \\ \frac{1}{x_3-y_1} & \frac{1}{x_3-y_2} & \frac{1}{x_3-y_3} \end{bmatrix} \text{ and}$$

$$V=\begin{bmatrix} \frac{1}{s_1-t_1} & \frac{1}{s_1-t_2} \\ \frac{1}{s_2-t_1} & \frac{1}{s_2-t_2} \end{bmatrix}.$$

Definition 1.3. Let F be a finite field, and p, q be two positive integers. Let $x\to M\times x$ be a mapping from F^p to F^q defined by the $q\times p$ matrix M. We say that it is an MDS matrix if the set of all pairs $(x, M\times x)$ is an MDS code, that is a linear code of dimension p, length $p+q$ and minimum distance $q+1$. In other form we can say that a square matrix is an MDS matrix if and only if every square sub-matrices of A are non-singular. This implies that all the entries of an MDS matrix must be nonzero.

Definition 1.4. An m$\times$ n rhotrix over a finite field K is an MDS rhotrix if it is the linear transformation $f(x)=Ax$ from K^n to K^m such that that no two different $m+n$-tuples of the form $(x, f(x))$ coincide. The necessary and sufficient condition of a rhotrix to be an MDS rhotrix is that all its sub-rhotrices are non-singular.

The construction of the MDS rhotrices is discussed by Sharma and Kumar [17]. The following Lemma 1.5 is also discussed in [17].

Lemma 1.5. Any rhotrix R_5 over GF(2^n) with all non zero entries is an MDS rhotrix iff its coupled matrices $M_1 = 3\times 3$ and $M_2 = 2\times 2$ are non-singular and all their entries are non zero.

Now, we construct maximum distance separable rhotrices by using Cauchy rhotrices.

2. MDS RHOTRICES FROM CAUCHY RHOTRICES OVER F_{2^3}

In this section, we constructed some maximum distance separable rhotrices from 5- dimensional Cauchy rhotrices using the elements of finite field F_{2^3}.

Theorem 2.1. Let R_5 be a Cauchy rhotrix whose coupled matrices $A = (a_{ij})_{3\times 3}$ and $B = (b_{lm})_{2\times 2}$ are defined as $a_{ij} = \frac{1}{x_i + y_j}$, $x_i + y_j \neq 0$ and $b_{lm} = \frac{1}{s_l + t_m}$, $s_l + t_m \neq 0$. Let $y_j = \alpha^{2^j}$, $x_i = y_j^{\,j+1} + y_j + 1$, $i, j = 1,2,3$ and $s_l = \alpha^{2l} + \alpha^l ; t_m = \alpha^{2^m} + 1; l, m = 1,2$, where α is the root of irreducible polynomial $p(x) = x^3 + x + 1$ in the extension field of GF(2^3). Then A and B form MDS rhotrix R_5.

Proof: For given

$$A = (a_{ij})_{3\times 3};\ a_{ij} = \frac{1}{x_i + y_j},\ x_i + y_j \neq 0;$$

$$y_j = \alpha^{2^j},\ x_i = y_j^{\,j+1} + y_j + 1;\ i, j = 1,2,3$$

we have

$$y_1 = \alpha^2,\ y_2 = \alpha^2 + \alpha,\ y_3 = \alpha$$

and

$$x_1 = \alpha + 1,\ x_2 = 0,\ x_3 = \alpha^2 + 1.$$

Therefore,

$$A = \begin{bmatrix} \frac{1}{\alpha^2+\alpha+1} & \frac{1}{\alpha^2+1} & 1 \\ \frac{1}{\alpha^2} & \frac{1}{\alpha^2+\alpha} & \frac{1}{\alpha} \\ 1 & \frac{1}{\alpha+1} & \frac{1}{\alpha^2+\alpha+1} \end{bmatrix}. \quad (2.1)$$

Since, α is the root of $x^3 + x + 1 = 0$. Therefore, $\alpha^2 + \alpha + 1 \neq 0,\ \alpha^2 + \alpha \neq 0,\ \alpha^2 + 1 \neq 0,$ $\alpha^2 \neq 0,\ \alpha + 1 \neq 0\ , \alpha \neq 0.$

Also, det $A = \frac{\alpha^2+1}{\alpha^2+\alpha+1} \neq 0$. So, A is non-singular.

Also all the sub matrices of A are non-singular. From (2.1), we have

$$A[1][1] = A[3][3] = \frac{1}{\alpha^2+\alpha+1} \neq 0,$$

$$A[1][2] = \frac{1}{\alpha^2+1} \neq 0,$$

$$A[1][3] = A[3][1] = 1 \neq 0,$$

$$A[2][1] = \frac{1}{\alpha^2} \neq 0,$$

$$A[2][2] = \frac{1}{\alpha^2+\alpha} \neq 0,$$

$$A[2][3] = \frac{1}{\alpha} \neq 0,$$

$$A[3][2] = \frac{1}{\alpha+1} \neq 0.$$

This implies that A is MDS matrix.

Similarly, we can prove that

$$B = \begin{bmatrix} \frac{1}{\alpha+1} & 1 \\ \frac{1}{\alpha^2+\alpha+1} & \frac{1}{\alpha^2+1} \end{bmatrix} \quad (2.2)$$

is MDS matrix. From (2.2), we have

$$B[1][1] = \frac{1}{\alpha+1} \neq 0,$$

$$B[1][2] = 1 \neq 0,$$

$$B[2][1] = \frac{1}{\alpha^2+\alpha+1} \neq 0,$$

$$B[2][2] = \frac{1}{\alpha^2+1} \neq 0.$$

The rhotrix of the coupled matrices A and B is

$$R_5 = \left\langle \begin{array}{ccccc} & & A[1][1] & & \\ & A[2][1] & B[1][1] & A[1][2] & \\ A[3][1] & B[2][1] & A[2][2] & B[1][2] & A[1][3] \\ & A[3][2] & B[2][2] & A[2][3] & \\ & & A[3][3] & & \end{array} \right\rangle$$

(2.3)

that is,

$$R_5 = \left\langle \begin{array}{ccccc} & & \frac{1}{\alpha^2+\alpha+1} & & \\ & \frac{1}{\alpha^2} & \frac{1}{\alpha+1} & \frac{1}{\alpha^2+1} & \\ 1 & \frac{1}{\alpha^2+\alpha+1} & \frac{1}{\alpha^2+\alpha} & 1 & 1 \\ & \frac{1}{\alpha+1} & \frac{1}{\alpha^2+1} & \frac{1}{\alpha} & \\ & & \frac{1}{\alpha^2+\alpha+1} & & \end{array} \right\rangle.$$

Therefore, from Lemma 1.5, it is clear that R_5 is maximum distance separable rhotrix (MDSR).

On the similar arguments we can prove the following Theorems 2.2 to 2.4.

Theorem 2.2. Let R_5 be a Cauchy rhotrix whose coupled matrices $A=(a_{ij})_{3\times3}$ and $B=(b_{lm})_{2\times2}$ are defined as

$a_{ij} = \frac{1}{x_i + y_j},\ x_i + y_j \neq 0$ and

$b_{lm} = \frac{1}{s_l + t_m},\ s_l + t_m \neq 0$. Let

$y_j = \alpha^{2^j} + \alpha^j + 1;\ x_i = y_j^{\,j+1} + y_j + 1,$

$i, j = 1,2,3$ and

$s_l = \alpha^{2^l};\ t_m = \alpha^m + \alpha + 1; l, m = 1,2,$ where α is the root of irreducible polynomial $p(x) = x^3 + x + 1$ in the extension field of GF (2^3). Then A and B form MDS rhotrix R_5.

Theorem 2.3. Let R_5 be a Cauchy rhotrix whose coupled matrices $A=(a_{ij})_{3\times3}$ and $B=(b_{lm})_{2\times2}$ are defined as

$a_{ij} = \frac{1}{x_i + y_j},\ x_i + y_j \neq 0$ and

$b_{lm} = \frac{1}{s_l + t_m},\ s_l + t_m \neq 0$. Let $y_j = \alpha^{2^j} + \alpha^j$; a

$x_i = y_j^{\,j+1} + 1,\ i, j = 1,2,3$ and

$s_l = \alpha^l + 1; t_m = \alpha^{2^m} + \alpha;\ l, m = 1,2,$ where α is the root of irreducible polynomial $p(x) = x^3 + x + 1$ in the extension field of GF (2^3). Then A and B form MDS rhotrix R_5.

Theorem 2.4. Let R_5 be a Cauchy rhotrix whose coupled matrices $A=(a_{ij})_{3\times3}$ and $B=(b_{lm})_{2\times2}$ are defined as

$a_{ij} = \frac{1}{x_i + y_j},\ x_i + y_j \neq 0$ and

$b_{lm} = \frac{1}{s_l + t_m},\ s_l + t_m \neq 0$. Let $y_j = \alpha^{2^j} + 1;$

$x_i = y_j + 1,\ i, j = 1,2,3$ and

$s_l = \alpha^{2l} + \alpha + 1; t_m = \alpha^{2^m} + \alpha;\ l, m = 1,2,$ where α is the root of irreducible polynomial $p(x) = x^3 + x + 1$ in the extension field of GF (2^3). Then A and B form MDS rhotrix R_5.

3. MDS RHOTRICES FROM CAUCHY RHOTRICES OVER F_{2^4}

Theorem 3.1. Let R_5 be a Cauchy rhotrix whose coupled matrices $A=(a_{ij})_{3\times3}$ and $B=(b_{lm})_{2\times2}$ are defined as

$a_{ij} = \frac{1}{x_i + y_j},\ x_i + y_j \neq 0$ and

$b_{lm} = \frac{1}{s_l + t_m},\ s_l + t_m \neq 0$. Let $y_j = \alpha^{2^j}$;

$x_i = y_j^{\,j+1} + y_j + 1,\ i, j = 1,2,3$ and

$s_l = \alpha^{2l} + \alpha^l; t_m = \alpha^{2^m} + 1; l, m = 1,2,$ where α is the root of irreducible polynomial $p(x) = x^4 + x + 1$ in the extension field of GF (2^4). Then A and B form MDS rhotrix R_5.

Proof: For given

$A=(a_{ij})_{3\times3};\ a_{ij} = \frac{1}{x_i + y_j},\ x_i + y_j \neq 0;\ y_j = \alpha^{2^j},$

$x_i = y_j^{\,j+1} + y_j + 1;\ i, j = 1,2,3,$

we have

$$y_1 = \alpha^2,\ y_2 = \alpha + 1,\ y_3 = \alpha^2 + 1$$

and

$$x_1 = \alpha^2 + \alpha,\ x_2 = \alpha^3 + \alpha^2 + 1,\ x_3 = 0.$$

Therefore,

$$A=\begin{bmatrix} \frac{1}{\alpha} & \frac{1}{\alpha^2+1} & \frac{1}{\alpha+1} \\ \frac{1}{\alpha^3+1} & \frac{1}{\alpha^3+\alpha^2+\alpha} & \frac{1}{\alpha^3} \\ \frac{1}{\alpha^2} & \frac{1}{\alpha+1} & \frac{1}{\alpha^2+1} \end{bmatrix}. \quad (3.1)$$

Since, α is the root of $x^4+x+1=0$. Therefore, $\alpha^3+\alpha^2+\alpha\neq 0,\ \alpha^2+1\neq 0,\ \alpha^3+1\neq 0,$ $\alpha^2\neq 0,\ \alpha^3\neq 0,\ \alpha+1\neq 0\ ,\alpha\neq 0.$

Also, $\det A=\frac{\alpha+1}{\alpha^3+\alpha+1}\neq 0$. So, A is non-singular.

Also all the sub matrices of A are non-singular. From (3.1), we have

$$A[1][1]=\frac{1}{\alpha}\neq 0,$$

$$A[1][2]=A[3][3]=\frac{1}{\alpha^2+1}\neq 0,$$

$$A[1][3]=A[3][2]=\frac{1}{\alpha+1}\neq 0,$$

$$A[2][1]=\frac{1}{\alpha^3+1}\neq 0,$$

$$A[2][2]=\frac{1}{\alpha^3+\alpha^2+\alpha}\neq 0$$

$$A[2][3]=\frac{1}{\alpha^3}\neq 0\ ,$$

$$A[3][1]=\frac{1}{\alpha^2}\neq 0.$$

Therefore, A is MDS matrix.

Similarly, we can prove that

$$B=\begin{bmatrix} \frac{1}{\alpha+1} & \frac{1}{\alpha^2} \\ \frac{1}{\alpha} & \frac{1}{\alpha^2+1} \end{bmatrix} \quad (3.2)$$

is MDS matrix. From (3.2),we have

$$B[1][1]=\frac{1}{\alpha+1}\neq 0,$$

$$B[1][2]=\frac{1}{\alpha^2}\neq 0,$$

$$B[2][1]=\frac{1}{\alpha}\neq 0,$$

$$B[2][2]=\frac{1}{\alpha^2+1}\neq 0.$$

The rhotrix of the coupled matrices A and B is

$$R_5=\left\langle \begin{matrix} & & A[1][1] & & \\ & A[2][1] & B[1][1] & A[1][2] & \\ A[3][1] & B[2][1] & A[2][2] & B[1][2] & A[1][3] \\ & A[3][2] & B[2][2] & A[2][3] & \\ & & A[3][3] & & \end{matrix} \right\rangle, \quad (3.3)$$

that is,

$$R_5=\left\langle \begin{matrix} & & \frac{1}{\alpha} & & \\ & \frac{1}{\alpha^3+1} & \frac{1}{\alpha+1} & \frac{1}{\alpha^2+1} & \\ \frac{1}{\alpha^2} & \frac{1}{\alpha} & \frac{1}{\alpha^3+\alpha^2+\alpha} & \frac{1}{\alpha^2} & \frac{1}{\alpha^3} \\ & \frac{1}{\alpha+1} & \frac{1}{\alpha^2+1} & \frac{1}{\alpha^3} & \\ & & \frac{1}{\alpha^2+1} & & \end{matrix} \right\rangle.$$

Therefore, from Lemma 1.5, it is clear that R_5 is maximum distance separable rhotrix (MDSR).

On the similar arguments we can prove the following theorems.

Theorem 3.2. Let R_5 be a Cauchy rhotrix whose coupled matrices $A=(a_{ij})_{3\times 3}$ and $B=(b_{lm})_{2\times 2}$ are defined as

$a_{ij}=\frac{1}{x_i+y_j},\ x_i+y_j\neq 0$ and

$b_{lm}=\frac{1}{s_l+t_m},\ s_l+t_m\neq 0$. Let

$y_j=\alpha^{2^j}+\alpha^j+1;\ x_i=y_j^{\,j+1}+\ y_j+1,$

$i,j=1,2,3$ and

$s_l=\alpha^{2^l}\ ;\ t_m=\alpha^m+\alpha+1;l,m=1,2,$ where α is the root of irreducible polynomial $p(x)=x^4+x+1$ in the extension field of GF (2^4). Then A and B form MDS rhotrix R_5.

Theorem 3.3. Let R_5 be a Cauchy rhotrix whose coupled matrices $A=(a_{ij})_{3\times 3}$ and $B=(b_{lm})_{2\times 2}$ are defined as

$a_{ij} = \frac{1}{x_i + y_j}$, $x_i + y_j \neq 0$ and

$b_{lm} = \frac{1}{s_l + t_m}$, $s_l + t_m \neq 0$. Let $y_j = \alpha^{2^j} + \alpha^j$; a

$x_i = y_j^{j+1} + 1$, $i, j = 1,2,3$ and

$s_l = \alpha^l + 1; t_m = \alpha^{2^m} + \alpha$; $l, m = 1,2$, where α is the root of irreducible polynomial $p(x) = x^4 + x + 1$ in the extension field of GF (2^4). Then A and B form MDS rhotrix R_5.

Theorem 3.4. Let R_5 be a Cauchy rhotrix whose coupled matrices $A = (a_{ij})_{3\times3}$ and $B = (b_{lm})_{2\times2}$ are defined as

$a_{ij} = \frac{1}{x_i + y_j}$, $x_i + y_j \neq 0$ and

$b_{lm} = \frac{1}{s_l + t_m}$, $s_l + t_m \neq 0$. Let $y_j = \alpha^{2^j} + 1$;

$x_i = y_j + 1$, $i, j = 1,2,3$ and

$s_l = \alpha^{2l} + \alpha + 1; t_m = \alpha^{2^m} + \alpha$; $l, m = 1,2$, where α is the root of irreducible polynomial $p(x) = x^4 + x + 1$ in the extension field of GF (2^4). Then A and B form MDS rhotrix R_5.

4. MDS RHOTRICES FROM CAUCHY RHOTRICES OVER F_{2^5}

In this section, we have construct some maximum distance separable rhotrices from 5- dimensional Cauchy rhotrices using the elements of finite field F_{2^5}.

Theorem 4.1. Let R_5 be a Cauchy rhotrix whose coupled matrices $A = (a_{ij})_{3\times3}$ and $B = (b_{lm})_{2\times2}$ are defined as

$a_{ij} = \frac{1}{x_i + y_j}$, $x_i + y_j \neq 0$ and

$b_{lm} = \frac{1}{s_l + t_m}$, $s_l + t_m \neq 0$. Let $y_j = \alpha^{2^j}$,

$x_i = y_j^{j+1} + y_j + 1$, $i, j = 1,2,3$ and

$s_l = \alpha^{2l} + \alpha^l; t_m = \alpha^{2^m} + 1; l, m = 1,2$, where α is the root of irreducible polynomial $p(x) = x^5 + x^2 + 1$ in the extension field of GF (2^5). Then A and B form MDS rhotrix R_5.

Proof: For given

$A = (a_{ij})_{3\times3}$; $a_{ij} = \frac{1}{x_i + y_j}$, $x_i + y_j \neq 0$;

$y_j = \alpha^{2^j}$, $x_i = y_j^{j+1} + y_j + 1$; $i, j = 1,2,3$

we have

$$y_1 = \alpha^2, y_2 = \alpha^4, y_3 = \alpha^3 + \alpha^2 + 1$$

and

$x_1 = \alpha^4 + \alpha^2 + 1$, $x_2 = \alpha^4 + \alpha^3 + \alpha^2 + \alpha + 1$,
$x_3 = \alpha^3 + \alpha^2 + \alpha$.

Therefore,

$$A = \begin{bmatrix} \frac{1}{\alpha^4+1} & \frac{1}{\alpha^2+1} & \frac{1}{\alpha^4+\alpha^3} \\ \frac{1}{\alpha^4+\alpha^3+\alpha+1} & \frac{1}{\alpha^4+\alpha^2+\alpha+1} & \frac{1}{\alpha^4+\alpha} \\ \frac{1}{\alpha^4+\alpha} & \frac{1}{\alpha^4+\alpha^3+\alpha^2+\alpha} & \frac{1}{\alpha+1} \end{bmatrix}. \quad (4.1)$$

Since, α is the root of $x^5 + x^2 + 1 = 0$. Therefore, $\alpha^4 + \alpha^3 + \alpha^2 + \alpha \neq 0$, $\alpha^4 + \alpha^3 + \alpha + 1 \neq 0$, $\alpha^4 + \alpha^2 + \alpha + 1 \neq 0$, $\alpha^4 + \alpha^3 \neq 0$, $\alpha^4 + \alpha \neq 0$, $\alpha^4 + 1 \neq 0$, $\alpha^2 + 1 \neq 0$ and $\alpha + 1 \neq 0$.

Also, $\det A = \frac{\alpha^4}{\alpha^4 + \alpha^3 + a^2} \neq 0$. So, A is non-singular. Also all the sub matrices of A are non-singular. From (4.1), we have

$A[1][1] = \frac{1}{\alpha^4 + 1} \neq 0$,

$A[1][2] = \frac{1}{\alpha^2 + 1} \neq 0$,

$A[1][3] = A[3][1] = \frac{1}{\alpha^4 + \alpha^3} \neq 0$,

$A[2][1] = \frac{1}{\alpha^4 + \alpha^3 + \alpha + 1} \neq 0$,

$A[2][2] = \frac{1}{\alpha^3 + \alpha^2 + \alpha + 1} \neq 0$,

$$A[2][3] = \frac{1}{\alpha^4 + \alpha} \neq 0,$$

$$A[3][1] = \frac{1}{\alpha^3 + \alpha} \neq 0,$$

$$A[2][2] = \frac{1}{\alpha^3 + \alpha^2 + \alpha + 1} \neq 0,$$

$$A[3][3] = \frac{1}{\alpha + 1} \neq 0.$$

Therefore, A is MDS matrix.

Similarly, we can prove that

$$B = \begin{bmatrix} \frac{1}{\alpha + 1} & \frac{1}{\alpha^4 + \alpha^2 + \alpha + 1} \\ \frac{1}{\alpha^4 + 1} & \frac{1}{\alpha^2 + 1} \end{bmatrix} \quad (4.2)$$

is MDS matrix. From (4.2), we have

$$B[1][1] = \frac{1}{\alpha + 1} \neq 0,$$

$$B[1][2] = \frac{1}{\alpha^4 + \alpha^2 + \alpha + 1} \neq 0,$$

$$B[2][1] = \frac{1}{\alpha^4 + 1} \neq 0,$$

$$B[2][2] = \frac{1}{\alpha^2 + 1} \neq 0.$$

The rhotrix of the coupled matrices A and B is

$$R_5 = \left\langle \begin{array}{ccccc} & & A[1][1] & & \\ & A[2][1] & B[1][1] & A[1][2] & \\ A[3][1] & B[2][1] & A[2][2] & B[1][2] & A[1][3] \\ & A[3][2] & B[2][2] & A[2][3] & \\ & & A[3][3] & & \end{array} \right\rangle. \quad (4.3)$$

Using (4.1) and (4.2) in (4.3), we have

$$R_5 = \left\langle \begin{array}{ccccc} & & \frac{1}{\alpha^4+1} & & \\ & \frac{1}{\alpha^4+\alpha^3+\alpha+1} & \frac{1}{\alpha+1} & \frac{1}{\alpha^2+1} & \\ \frac{1}{\alpha^3+\alpha} & \frac{1}{\alpha^4+1} & \frac{1}{\alpha^3+\alpha^2+\alpha+1} & \frac{1}{\alpha^4+\alpha^2+\alpha+1} & \frac{1}{\alpha^4+\alpha^3} \\ & \frac{1}{\alpha^4+\alpha^3+\alpha^2+\alpha} & \frac{1}{\alpha^2+1} & \frac{1}{\alpha^4+\alpha} & \\ & & \frac{1}{\alpha+1} & & \end{array} \right\rangle.$$

Therefore, from Lemma 1.5, it is clear that R_5 is maximum distance separable rhotrix (MDSR).

In the similar ways we can prove the following theorems.

Theorem 4.2. Let R_5 be a Cauchy rhotrix whose coupled matrices $A = (a_{ij})_{3\times3}$ and $B = (b_{lm})_{2\times2}$ are defined as $a_{ij} = \frac{1}{x_i + y_j}$, $x_i + y_j \neq 0$ and $b_{lm} = \frac{1}{s_l + t_m}$, $s_l + t_m \neq 0$. Let $y_j = \alpha^{2^j} + \alpha^j + 1$; $x_i = y_j^{\,j+1} + y_j + 1$, $i, j = 1,2,3$ and $s_l = \alpha^{2^l}$; $t_m = \alpha^m + \alpha + 1$; $l, m = 1,2$, where α is the root of irreducible polynomial $p(x) = x^5 + x^2 + 1$ in the extension field of GF(2^3). Then A and B form MDS rhotrix R_5.

Theorem 4.3. Let R_5 be a Cauchy rhotrix whose coupled matrices $A = (a_{ij})_{3\times3}$ and $B = (b_{lm})_{2\times2}$ are defined as $a_{ij} = \frac{1}{x_i + y_j}$, $x_i + y_j \neq 0$ and $b_{lm} = \frac{1}{s_l + t_m}$, $s_l + t_m \neq 0$. Let $y_j = \alpha^{2^j} + \alpha^j$; a $x_i = y_j^{\,j+1} + 1$, $i, j = 1,2,3$ and $s_l = \alpha^l + 1$; $t_m = \alpha^{2^m} + \alpha$; $l, m = 1,2$, where α is the root of irreducible polynomial $p(x) = x^5 + x^2 + 1$ in the extension field of GF(2^3). Then A and B form MDS rhotrix R_5.

Theorem 4.4. Let R_5 be a Cauchy rhotrix whose coupled matrices $A = (a_{ij})_{3\times3}$ and $B = (b_{lm})_{2\times2}$ are defined as $a_{ij} = \frac{1}{x_i + y_j}$, $x_i + y_j \neq 0$ and $b_{lm} = \frac{1}{s_l + t_m}$, $s_l + t_m \neq 0$. Let $y_j = \alpha^{2^j} + 1$; $x_i = y_j + 1$, $i, j = 1,2,3$ and $s_l = \alpha^{2l} + \alpha + 1$; $t_m = \alpha^{2^m} + \alpha$; $l, m = 1,2$, where α is the root of irreducible polynomial $p(x) = x^5 + x^2 + 1$ in the extension field of GF(2^3). Then A and B form MDS rhotrix R_5.

5. MDS RHOTRICES FROM CAUCHY RHOTRICES OVER F_{2^6}

In this section, we have construct some maximum distance separable rhotrices from 5- dimensional Cauchy rhotrices using the elements of finite field F_{2^6}.

Theorem 5.1. Let R_5 be a Cauchy rhotrix whose coupled matrices $A=(a_{ij})_{3\times3}$ and $B=(b_{lm})_{2\times2}$ are defined as $a_{ij}=\frac{1}{x_i+y_j}$, $x_i+y_j\neq0$ and $b_{lm}=\frac{1}{s_l+t_m}$, $s_l+t_m\neq0$. Let $y_j=\alpha^{2^j}$, $x_i=y_j^{\,j+1}+y_j+1$, $i,j=1,2,3$ and $s_l=\alpha^{2l}+\alpha^l; t_m=\alpha^{2^m}+1; l,m=1,2$, where α is the root of irreducible polynomial $p(x)=x^6+x+1$ in the extension field of GF(2^6). Then A and B form MDS rhotrix R_5.

Proof: For given $A=(a_{ij})_{3\times3}; a_{ij}=\frac{1}{x_i+y_j}, x_i+y_j\neq0;$, we have

$$y_j=\alpha^{2^j},\ x_i=y_j^{\,j+1}+y_j+1;\ i,j=1,2,3$$

$$y_1=\alpha^2,\ y_2=\alpha^4,\ y_3=\alpha^3+\alpha^2$$

and

$$x_1=\alpha^4+\alpha^2+1,\ x_2=\alpha^4+\alpha^2,\ x_3=\alpha^3.$$

Therefore,

$$A=\begin{bmatrix}\frac{1}{\alpha^4+1} & \frac{1}{\alpha^2+1} & \frac{1}{\alpha^4+\alpha^3+1}\\ \frac{1}{\alpha^4} & \frac{1}{\alpha^2} & \frac{1}{\alpha^4+\alpha^3}\\ \frac{1}{\alpha^3+\alpha^2} & \frac{1}{\alpha^4+\alpha^3} & \frac{1}{\alpha^2}\end{bmatrix}. \quad (5.1)$$

Since, α is the root of $x^6+x+1=0$. Therefore,

$\alpha^4+1\neq0, \alpha^2+1\neq0, \alpha^4+\alpha^2+\alpha+1\neq0,$
$\alpha^4+\alpha^3+1\neq0, \alpha^4\neq0, \alpha^2\neq0,$
$\alpha^4+\alpha^3\neq0,$ and $\alpha^3+\alpha^2\neq0.$

Also, det $A=\frac{\alpha^2+\alpha}{\alpha^5+\alpha^3+a^2}\neq0$. So, A is non-singular. Also all the sub matrices of A are non-singular.

From (5.1), we have

$$A[1][1]=\frac{1}{\alpha^4+1}\neq0,$$

$$A[1][2]=\frac{1}{\alpha^2+1}\neq0,$$

$$A[1][3]=\frac{1}{\alpha^4+\alpha^3+1}\neq0,$$

$$A[2][1]=\frac{1}{\alpha^4}\neq0,$$

$$A[2][2]=A[3][3]=\frac{1}{\alpha^2}\neq0,$$

$$A[2][3]=\frac{1}{\alpha^4+\alpha^3}\neq0,$$

$$A[3][1]=\frac{1}{\alpha^3+\alpha^2}\neq0,$$

$$A[2][2]=\frac{1}{\alpha^3+\alpha^2+\alpha+1}\neq0.$$

Therefore, A is MDS matrix.

Similarly, we can prove that

$$B=\begin{bmatrix}\frac{1}{\alpha+1} & \frac{1}{\alpha^4+\alpha^2+\alpha+1}\\ \frac{1}{\alpha^4+1} & \frac{1}{\alpha^2+1}\end{bmatrix} \quad (5.2)$$

is MDS matrix. From (5.2), we have

$$B[1][1]=\frac{1}{\alpha+1}\neq0,$$

$$B[1][2]=\frac{1}{\alpha^4+\alpha^2+\alpha+1}\neq0,$$

$$B[2][1]=\frac{1}{\alpha^4+1}\neq0,\ B[2][2]=\frac{1}{\alpha^2+1}\neq0.$$

The rhotrix of the coupled matrices A and B is

$$R_5=\left\langle\begin{array}{ccccc} & & A[1][1] & & \\ & A[2][1] & B[1][1] & A[1][2] & \\ A[3][1] & B[2][1] & A[2][2] & B[1][2] & A[1][3]\\ & A[3][2] & B[2][2] & A[2][3] & \\ & & A[3][3] & & \end{array}\right\rangle \quad (5.3)$$

.

Using (5.1) and (5.2) in (5.3), we have

$$R_5 = \left\langle \begin{matrix} & & \frac{1}{\alpha^4+1} & \\ & \frac{1}{\alpha^4} & \frac{1}{\alpha+1} & \frac{1}{\alpha^2+1} \\ \frac{1}{\alpha^3+\alpha^2} & \frac{1}{\alpha^4+1} & \frac{1}{\alpha^2} & \frac{1}{\alpha^4+\alpha^2+\alpha+1} \quad \frac{1}{\alpha^4+\alpha^3+1} \\ & \frac{1}{\alpha^4+\alpha^3} & \frac{1}{\alpha^2+1} & \frac{1}{\alpha^4+\alpha^3} \\ & & \frac{1}{\alpha^2} & \end{matrix} \right\rangle.$$

Therefore, from Lemma 1.5, it is clear that R_5 is maximum distance separable rhotrix (MDSR).

Theorem 5.2. Let R_5 be a Cauchy rhotrix whose coupled matrices $A=(a_{ij})_{3\times3}$ and $B=(b_{lm})_{2\times2}$ are defined as $a_{ij}=\frac{1}{x_i+y_j}$, $x_i+y_j\neq0$ and $b_{lm}=\frac{1}{s_l+t_m}$, $s_l+t_m\neq0$. Let $y_j=\alpha^{2^j}+\alpha^j+1$; $x_i=y_j^{\,j+1}+y_j+1$, $i,j=1,2,3$ and $s_l=\alpha^{2^l}$; $t_m=\alpha^m+\alpha+1; l,m=1,2$, where α is the root of irreducible polynomial $p(x)=x^6+x+1$ in the extension field of GF(2^6). Then A and B form MDS rhotrix R_5.

Theorem 5.3. Let R_5 be a Cauchy rhotrix whose coupled matrices $A=(a_{ij})_{3\times3}$ and $B=(b_{lm})_{2\times2}$ are defined as $a_{ij}=\frac{1}{x_i+y_j}$, $x_i+y_j\neq0$ and $b_{lm}=\frac{1}{s_l+t_m}$, $s_l+t_m\neq0$. Let $y_j=\alpha^{2^j}+\alpha^j$; a $x_i=y_j^{\,j+1}+1$, $i,j=1,2,3$ and $s_l=\alpha^l+1; t_m=\alpha^{2^m}+\alpha$; $l,m=1,2$, where α is the root of irreducible polynomial $p(x)=x^6+x+1$ in the extension field of GF(2^6). Then A and B form MDS rhotrix R_5.

Theorem 5.4. Let R_5 be a Cauchy rhotrix whose coupled matrices $A=(a_{ij})_{3\times3}$ and $B=(b_{lm})_{2\times2}$ are defined as $a_{ij}=\frac{1}{x_i+y_j}$, $x_i+y_j\neq0$ and $b_{lm}=\frac{1}{s_l+t_m}$, $s_l+t_m\neq0$. Let $y_j=\alpha^{2^j}+1$; $x_i=y_j+1$, $i,j=1,2,3$ and $s_l=\alpha^{2l}+\alpha+1; t_m=\alpha^{2^m}+\alpha$; $l,m=1,2$, where α is the root of irreducible polynomial $p(x)=x^6+x+1$ in the extension field of GF(2^6). Then A and B form MDS rhotrix R_5.

6. CONCLUSION

In the present paper, the Cauchy rhotrix is defined. The maximum distance seperable rhotrices (MDS) are of much interest in the field of cryptography. Therefore, MDS rhotrices over finite fields are also constructed in this paper.

ABSTRACT:
This paper deals with the convection of micropolar fluids heated and soluted from below in the presence of suspended particles (fine dust) and uniform vertical rotation and uniform vertical magnetic field in a porous medium. Using the Boussinesq approximation, the linearized stability theory and normal mode analysis, the exact solutions are obtained for the case of two free boundaries. It is found that the presence of the suspended particles number density, the rotation parameter, stable solute, magnetic field intensity and medium permeability bring oscillatory modes which were non–existent in their absence. It is found that the presence of coupling between thermal and micropolar effects, rotation parameter, solute parameter and suspended particles may introduce overstability in the system. Graphs have been plotted by giving numerical values to the parameters accounting for rotation parameter , magnetic field solute parameter, the dynamic microrotation viscosity and coefficient of angular viscosity to depict the stability characteristics, for both the cases of stationary convection and overstability. It is found that Rayleigh number for the case of overstability and stationary convection increases with increase in rotation parameter, as well as with magnetic field intensity, solute parameter and decreases with increase in micropolar coefficients and medium permeability, for a fixed wave number, implying thereby the stabilizing effect of rotation parameter, magnetic field intensity ,solute parameter and destabilizing effect of micropolar coefficients and medium permeability on the thermosolutal convection of micropolar fluids.

Research Journal of Science and Technology (RJST) is an international, peer-reviewed journal, devoted to science and technology.....

ABOUT JOURNAL

Research Journal of Science and Technology (RJST) is an international, peer-reviewed journal, devoted to science and technology. The aim of RJST is to increase the impact of technological research both in academia and industry, with strong emphasis on quality and originality. RJST publishes Original Research Articles, Short Communications, Review Articles in all areas of Science and Technology.

Research Journal of Science and Technology (RJST) is published every year in last week of February, April, June, August, October and December from Raipur. From January 2013, is Quarterly and shall be published every year in last week of March, June, September and December.

Abstract

Formulae display: MathJax

Observing that every *k*-irreducible ideal of a semiring *R* is a *k*-primary ideal, if *R* is an additively cancellative, yoked and commutative Noetherian semiring, we establish the primary decomposition and uniqueness of the primary decomposition of *k*-ideals of such semirings. Finally, the primary decomposition and uniqueness of primary decomposition proved for *k*-ideals is also generalised for fuzzy *k*-ideals of these semirings.

and the role of these ideals in semirings becomes significant in the absence of additive inverses. The results which are true for ideals in rings have also been established for *k*-ideals in semirings by various authors (cf. [1–13]). In view of these facts various researchers attempted the primary decomposition for *k*-ideals in semirings analogous to the primary decomposition of ideals in rings: In a commutative Noetherian ring, every ideal can be decomposed as a finite intersection of primary ideals (Lasker–Noether Theorem [14]). For a deep study of primary ideals in rings and semirings one can refer to [8–12, 15–19].

The above result of ring theory is not true for arbitrary ideals in semirings as noticed in [20]. Atani and Atani [20, Theorem 4] had proved that in a commutative Noetherian semiring, every proper *k*-ideal can be represented as a finite intersection of *k*-primary ideals. But it was observed by Lescot [21] that there were some errors in the results used to prove the aforementioned result. For example, $I + Ra^n$ is not a *k*-ideal, even if *I* is a *k*-ideal. But in [20], it is taken for granted that the ideal $I + Ra^n$ is a *k*-ideal. Lescot [21] found these errors after observing in Example 6.2 that {0} ideal may not be a finite intersection of *k*-primary ideals in a commutative Noetherian semiring. With these observations, he developed the theory of weak primary decomposition for semirings of characteristic 1. But still the question of settling the primary decomposition for a proper *k*-ideal (other than $\{0\}$ and semiring *R*) remained unsolved. In this direction, Kar et al. [22, Theorem 4.4] proved that every proper *k*-ideal of a commutative Noetherian semiring *R* can be expressed as a finite intersection of *k*-irreducible ideals (Definition 2.1). They tried to prove the primary decomposition by observing that in a commutative Noetherian semiring, every *k*-irreducible ideal is a *k*-primary ideal [22, Theorem 4.6]. But the proof of this result has the same errors again and the problem still remains unsolved. This motivated us to establish the primary decomposition of *k*-ideals in commutative Noetherian semirings.

In this paper, we provide a correct proof of Theorem 4.6 of [22], which settles the primary decomposition for *k*-ideals in commutative Noetherian semirings. In order to establish the uniqueness of primary decomposition for semirings, first we prove some required basic results for uniqueness and finally establish the uniqueness of primary decomposition for *k*-ideals in commutative Noetherian semirings: If $I = \cap_{i=1}^{n} Q_i$, where each Q_i is a primary ideal and $\sqrt{Q_i} = P_i$, then the set $\{P_1, P_2, \ldots, P_n\}$ is independent of particular choice of decomposition of *I*.

Fuzzy *k*-ideals play an important role for the study of different

authors (cf. [1, 7, 10, 23–27]). From the primary decomposition of *k*-ideals in semirings, the fuzzy primary decomposition of fuzzy *k*-ideals follows as given in [22]. But the uniqueness theorem for fuzzy *k*-ideals [22, Theorem 5.5], is also incorrect. This motivated us to reinvestigate the uniqueness of fuzzy *k*-primary decomposition in semirings.

2. Primary Decomposition of *k*-Ideals in Semirings

Throughout this paper, *R* is a commutative semiring with identity. First, we recall some definitions and results which are necessary to prove the primary decomposition and uniqueness theorems for *k*-ideals in commutative Noetherian semirings.

Definition 2.1

A proper *k*-ideal *I* of a semiring *R* is called *k*-irreducible ideal if for any two *k*-ideals *J*, *K* of *R*, $I = J \cap K$ implies that either *I* = *J* or *I* = *K*.

Definition 2.2

Let *I* be a *k*-ideal of a semiring *R*. Then *I* is said to have a primary decomposition if *I* can be expressed as $I = \cap_{i=1}^{n} Q_i$, where each Q_i is a primary ideal of *R*. Also, a primary decomposition of the type $I = \cap_{i=1}^{n} Q_i$ with $\sqrt{Q_i} = P_i$, is called a reduced primary decomposition of *I*, if P_i's are distinct and *I* cannot be expressed as an intersection of a proper subset of ideals Q_i in the primary decomposition of *I*. A reduced primary decomposition can be obtained from any primary decomposition by deleting those Q_j that contains $\cap_{\substack{i=1 \\ i \neq j}}^{n} Q_i$ and grouping together all distinct $\sqrt{Q_i}$'s-primary ideal.

The main aim of this section is to prove the existence and uniqueness of primary decomposition for *k*-ideals in a commutative Noetherian semiring. First, we prove the existence part as stated below:

Theorem 2.3

Primary Decomposition of *k*-Ideals

Let *I* be a *k*-ideal of an additively cancellative, yoked and commutative Noetherian semiring *R*. Then *I* can be represented as a finite intersection of primary ideals of *R*, that is, *I* has a reduced primary decomposition.

The decomposition of *k*-ideals in terms of *k*-irreducible ideals has already been proved in [22] as follows:

[22], Theorem 2.1

Every proper *k*-ideal of a commutative Noetherian semiring *R* can be expressed as a finite intersection of *k*-irreducible ideals.

Therefore, primary decomposition for *k*-ideals in semirings follows immediately if we prove

Theorem 2.5

Let *R* be an additively cancellative, yoked and commutative Noetherian semiring. Then every *k*-irreducible ideal of *R* is a primary ideal of *R*.

Kar et al. [22, Theorem 4.6], made an attempt to prove the same without considering additively cancellative and yoked semiring, but the proof of the result has some errors as mentioned in the introduction. For the proof of the required result, we first analyse some common errors committed by many authors regarding *k*-ideals, and prove some facts about *k*-ideals. First, we note that any ideal $I =< a >$ is not a *k*-ideal in semirings as observed by Golan in [28, Example 6.17]. That is, if $I = \ < (1 + x) >$ is an ideal of $\mathbb{N}[x]$ (semiring of polynomials over non-negative integers $\mathbb{N}$ in the indeterminate *x*), then $(1 + x)^3 = (x^3 + 1) + 3x(1 + x) \in I, 3x(1 + x) \in I$, but $(x^3 + 1) \notin I$ implies that *I* is not a *k*-ideal of $\mathbb{N}[x]$. Any ideal generated by a single element becomes a *k*-ideal, if we impose some conditions on a semiring as shown below:

Lemma 2.6

Let *R* be an additively cancellative, yoked and zerosumfree semiring. Then for any $a \in R$, the ideal $I =< a >$ is a *k*- ideal of *R*.

Proof.

Let $a_1 + a_2, a_1 \in I$. Then there exist some $r_1, r_2 \in R$ such that $a_1 + a_2 = ar_1$ and $a_1 = ar_2$. As *R* is yoked, there exists some $r_3 \in R$ such that $r_1 + r_3 = r_2$ or $r_2 + r_3 = r_1$. If $r_1 + r_3 = r_2$, then $ar_1 = ar_2 + a_2 = ar_1 + ar_3 + a_2$ implies that $ar_3 + a_2 = 0$, as *R* is additively cancellative. Also, $a_2 = ar_3 = 0 \in I$, as *R* is zerosumfree.

Further, if $r_2 + r_3 = r_1$, then $ar_2 + a_2 = ar_1 = a(r_2 + r_3) = ar_2 + ar_3$ implies that $a_2 = ar_3 \in I$, since *R* is additively cancellative. Thus, $I =< a >$ is a *k*-ideal of *R*.

The semiring considered in above example is additively cancellative, zerosumfree, but it is not yoked, for let $f(x) = 5x^2 + 9x + 2 \quad \text{and} \quad g(x) = 11x^2 + 3x + 5$ be two polynomials in $\mathbb{N}[x]$, then there exists no $h(x) \in \mathbb{N}[x]$ such that either $f(x) + h(x) = g(x)$ or $g(x) + h(x) = f(x)$.

k-ideals may not be a *k*-ideal in a semiring. There are plenty of *k*-ideals in the semiring $\mathbb{N}$, but their sum is not a *k*-ideal. However, the sum of two *k*-ideals is a *k*-ideal in a lattice ordered semiring (cf. [28, Corollary 21.22]). While proving Theorem 2.5, the authors wrongly used that the ideals $(Q + < a^k >)$ and $(Q + < b >)$ are *k*-ideals. In view of the above observations, Theorem 2.5 follows verbatim as proved in [22, Theorem 4.6] for additively cancellative, yoked, zerosumfree and lattice ordered semirings, because in this case, both an ideal generated by a single element and sum of two *k*-ideals are *k*-ideals. Here, we give a proof of Theorem 2.5 without resorting to the restrictions: lattice ordered and zerosumfree semiring.

Proof of Theorem 2.5.

Let *Q* be a *k*-irreducible ideal of a Noetherian semiring *R*. Let $ab \in Q$ be such that $b \notin Q$. Now, we construct two ideals *I* and *J* of *R* as follows:
$I =< a^k > + Q \quad \text{and} \quad J =< b > + Q$. Then, clearly, $Q \subseteq I \cap J$.

Let $y \in I \cap J$. Then $y = a^n z + q$ for some $z \in R$ and $q \in Q$. Again $aJ \subseteq Q$ (since $ab \in Q$) and so $ay \in Q$ (since $y \in J$).

Therefore, $ay = a^{n+1}z + aq$. Thus, we get that $a^{n+1}z + aq \in Q$. Also, $aq \in Q$, since $q \in Q$ and *Q* is an ideal of *R*. It follows that $a^{n+1}z \in Q$, since *Q* is a *k*-ideal of *R*. Construct a set $A_n = \{x \in R \mid a^n x \in Q\}$. It is easy to check that A_n is an ideal of *R* and $A_1 \subseteq A_2 \cdots$. is an ascending chain of ideals. Since *R* is Noetherian, so $A_n = A_{n+1} = \cdots$. for some $n \in \mathbb{Z}^+$. Again $a^{n+1}z \in Q$ implies that $z \in A_{n+1} = A_n$. It demonstrates that $a^n z \in Q$ which implies that $y \in Q$ and hence $I \cap J = Q$.

Let $rad(R)$ denote the Jacobson Bourne radical of a semiring *R*, that is, the intersection of all maximal *k*-ideals of *R*, as *R* is assumed to be additively cancellative and yoked (cf. [29, Proposition 23]). Assume that *A* is an ideal of *R* and $rad(A)$ denotes the intersection of all maximal *k*-ideals of *R* containing *A*.

Let $\bar{A}$ denotes the *k*-closure of an ideal *A* of *R*, i.e.$\bar{A} = \{a \in A \mid a + b = c$, for some $b, c \in A\}$ and $\sqrt{I} = \{x \in R \mid a^n \in I$ for some positive integer $n\}$.

Obviously, $\bar{I}$ is a *k*-ideal of *R* and every Noetherian semiring is weakly Noetherian (a semiring *R* is weakly Noetherian if every ascending chain of *k*-ideals of *R* is ultimately stationary). Then by Lescot [21, Corollary 6.6], there are prime *k*-ideals $P_1, P_2, \ldots., P_n$ of *R* such that $\sqrt{I} = P_1 \cap P_2 \cdots . \cap P_n$. Thus, we have $\sqrt{I} \subseteq rad(R)$ and by Lescot [21, Lemma 2.2], $\bar{I} \cap \bar{J} \subseteq \sqrt{\bar{I}} \cap \sqrt{\bar{J}} = \sqrt{\overline{I \cap J}} \subseteq rad(\overline{I \cap J})$.

$\overline{J}$). So, we have $rad(\overline{I \cap J}) = rad(\overline{I}) \cap rad(\overline{J})$.

Now, $Q = I \cap J$ which implies that $\overline{Q} = \overline{I \cap J} \Rightarrow Q = \overline{I \cap J}$, since *Q* is a *k*-ideal of *R*. This shows that $rad(Q) = rad(\overline{I \cap J}) = rad(\overline{I}) \cap rad(\overline{J})$, that is, $rad(Q) = rad(\overline{I}) \cap rad(\overline{J})$.

Again, *Q* is a *k*-irreducible ideal, which implies that $rad(Q)$ is *k*-irreducible. Also $rad(Q) = Q \cap rad(R)$, but $rad(Q) \neq rad(R)$. Thus, $rad(Q) = Q$, since $rad(Q)$ is *k*-irreducible. Accordingly, $Q = rad(\overline{I}) \cap rad(\overline{J})$, where each of $rad(\overline{I})$ and $rad(\overline{J})$ are *k*-ideals of *R*. Now $b \in J$ implies that $b \in rad(\overline{J})$, but $b \notin Q$, that is, $Q \neq rad(\overline{J})$. So $Q = rad(\overline{I})$, since *Q* is *k*-irreducible. Further, $a^n \in I$ leads to $a^n \in rad(\overline{I}) = Q$. Hence, *Q* is a primary ideal.

Remark 2.7

Now Theorem 2.3, follows by combining Theorems 2.4 and 2.5. It is important to note here that all Q_i's in the primary decomposition of a *k*-ideal *I* have an additional property that these are also *k*-ideals. Now it only remains to prove the uniqueness of primary decomposition of a *k*-ideal *I*.

The following lemma will be used to prove the uniqueness of reduced primary decomposition of *k*-ideals in semirings.

Lemma 2.8

Let *R* be a semiring and *Q* a *P*-primary ideal of *R*. Then we have

(i) If $x \in R$, $(Q:x) = \{r \in R \mid rx \in Q\}$ is an ideal of *R*;

(ii) If $x \in Q$, then $(Q:x) = R$;

(iii) If $x \notin P$, then $(Q:x) = Q$;

(iv) If $x \notin Q$, then $(Q:x)$ is *P*-primary.

Proof.

(i) Let $r_1, r_2 \in (Q:x)$ and $a \in R$. Then $r_1x, r_2x \in Q$ implies that $(r_1 + r_2)x \in Q$ and $r_1ax \in Q$, as *Q* is an ideal of *R*. Hence $(Q:x)$ is an ideal of *R*.

(ii) If $x \in Q$, then $Rx \subseteq Q$, as *Q* is an ideal of *R* which implies that $R \subseteq (Q:x)$. Also, $(Q:x)$ is an ideal of *R* and so, $(Q:x) = R$.

(iii) Assume that $x \notin P$. If $a \in Q$, then $ax \in Q$ implies that $a \in (Q:x)$. For the converse part, suppose that $b \notin Q$ and $xb \in Q$. Then $x \in \sqrt{Q} = P$, as *Q* is *P*-primary ideal of *R* which contradicts that $x \notin P$. This infers that $xb \notin Q$ and so $b \notin (Q:x)$.

(iv) Suppose that $x \notin Q$. If $y \in (Q:x)$, then $xy \in Q$ implies that $y \in \sqrt{Q} = P$, as *Q* is *P*-primary ideal of *R*. Thus, $Q \subseteq (Q:x) \subseteq P$ implies

R. Clearly, the ideal $(Q:x)$ is a proper as $x \notin Q$ and so $1 \notin (Q:x)$. Assume that $ab \in (Q:x)$ and $b \notin \sqrt{(Q:x)}$ for $a, b \in R$. Then $abx \in Q$ and Q is a P-primary ideal of R which implies that either $ax \in Q$ or $b \in P = \sqrt{(Q:x)}$. Thus, $a \in (Q:x)$ as $b \notin \sqrt{(Q:x)}$.

We now prove the uniqueness of the reduced primary decomposition of a k-ideal of a semiring as follows:

Theorem 2.9

Uniqueness of Primary Decomposition

Let R be an additively cancellative, yoked and commutative Noetherian semiring and I be a k-ideal of R. If $I = \cap_{i=1}^{n} Q_i$ is a reduced primary decomposition of I with $\sqrt{Q_i} = P_i$ for $i = 1, 2 \cdots . n$, then

$\{P_1, P_2, \ldots . , P_n\} = \{\text{Prime ideals } P \mid \text{there exists } x \in R \text{ such that } P = \sqrt{(I:x)}\}$. The set $\{P_1, P_2 \cdots . P_n\}$ is independent of the particular reduced primary decomposition chosen for I.

Proof.

Let $x \in R$. Then by Lemma 2.8 (iv),
$\sqrt{(I:x)} = \sqrt{\left(\bigcap_{i=1}^{n} Q_i : x\right)} = \bigcap_{i=1}^{n} \sqrt{(Q_i:x)} = \bigcap_{i,\, x \notin Q_i} P_i$ and therefore,
$\sqrt{(I:x)} \subseteq P_i$, for all $i = 1, 2 \cdots . n$. Also, if $\sqrt{(I:x)}$ is prime, then Π
$P_{i,\, x \notin Q_i} \subseteq \cap_{i, x \notin Q_i} P_i = \sqrt{(I:x)}$ implies that $P_i \subseteq \sqrt{(I:x)}$ for some $i = 1, 2 \cdots n$.

Thus, we have
$\{P_1, P_2, \ldots . , P_n\} \subseteq \{\text{Prime ideals } P \mid \text{there exists } x \in R \text{ such that } P = \sqrt{(I:x)}\}$. On the other hand, for $i \in \{1, 2 \cdots . n\}$, we have $\cap_{j \neq i}^{n} Q_j \nsubseteq Q_i$, as the primary decomposition is reduced. So there exists some $x_i \in \cap_{j \neq i}^{n} Q_j$ and $x_i \notin Q_i$. If $y \in (Q_i : x_i)$, then $yx_i \in Q_i$ and $yx_i \in (\cap_{j \neq i}^{n} Q_j) \cap Q_i = I$ which implies that $y \in (I:x_i)$.

Thus, $(Q_i:x_i) \subseteq (I:x_i) \subseteq (Q_i:x_i)$, as $I \subseteq Q_i$.

So, $(Q_i:x_i) = (I:x_i)$ and by Lemma 2.8(iv), $\sqrt{(I:x_i)} = \sqrt{(Q_i:x_i)} = P_i$. Hence, $\{P_1, P_2, \ldots . , P_n\} = \{\text{Prime ideals } P \mid \exists x \in R \text{ such that } P = \sqrt{(I:x)}\}$.

---

3. Fuzzy Primary Decomposition of Fuzzy k-Ideals in Semirings

In this section, we prove the existence and uniqueness of fuzzy primary decomposition of fuzzy k-ideals of semirings. We first recall some definitions from [22] which are required to prove the

Definition 3.1

Let μ be a fuzzy ideal of a semiring R. Then the radical of μ, denoted by $\sqrt{\mu}$ is defined by $\sqrt{\mu}(x) = \sup_{n\geq 1}\{\mu(x^n)$, for all $x \in R\}$.

Example 3.2

Consider the semiring $R = (\mathbb{N}, +, .)$ of non-negative integers with respect to usual addition and multiplication of integers. Define a fuzzy ideal μ of $\mathbb{N}$ as follows:

$\mu(x) = \begin{cases} 1 - \frac{1}{n}, & \text{if } x \in \langle 2^{n-1}\rangle \setminus \langle 2^n\rangle, n = 1, 2, \ldots \\ 1, & \text{if } x = 0 \end{cases}$. Observe that $im\ \mu = \{0, 1, \frac{1}{2}, \frac{2}{3}, \ldots., \frac{n}{n+1}, \ldots\}$ and clearly,

$\sqrt{\mu}(x) = \begin{cases} 1, & \text{if } x \in \langle 2\rangle \\ 0, & \text{if } x \in \mathbb{Z} \setminus \langle 2\rangle \end{cases}$.

Definition 3.3

Let μ be a non-constant fuzzy k-ideal of a semiring R. Then μ is said to be a fuzzy k-irreducible ideal of R if for any two fuzzy k-ideals θ and η of R, $\mu = \theta \cap \eta$ implies either $\mu = \theta$ or $\mu = \eta$.

Example 3.4

[22]

Let R be a semiring as in Example 3.2 and μ be a fuzzy ideal of R defined as follows:

$\mu(x) = \begin{cases} 1, & \text{if } x \in \langle 16\rangle \\ 0.4, & \text{otherwise} \end{cases}$. Then, by Kar et al. [22, Theorem 4.2], one can easily check that μ is a fuzzy k- irreducible ideal of R.

Definition 3.5

A fuzzy ideal μ of a semiring R is said to be fuzzy prime ideal of R if it is non-constant (i.e. $|im\mu| \geq 2$) and any two fuzzy ideals θ and η of R, $\theta \circ \eta \subseteq \mu$ implies that either $\theta \subseteq \mu$ or $\eta \subseteq \mu$.

Definition 3.6

A fuzzy ideal μ of a semiring R is said to be fuzzy primary ideal of R if it is non-constant (i.e. $|im\mu| \geq 2$) and any two fuzzy ideals θ and η of R, $\theta \circ \eta \subseteq \mu$ implies that either $\theta \subseteq \mu$ or $\eta \subseteq \sqrt{\mu}$. If $\sqrt{\mu} = \nu$, then μ is called fuzzy ν-primary ideal of R.

Definition 3.7

Let μ and θ be two fuzzy subsets of a semiring R. Then fuzzy colon ideal $(\mu: \theta)$ is defined by $(\mu: \theta)(x) = \sup_{\lambda \in IFS}\{\lambda(x) \mid \lambda \circ \theta \subseteq \mu\}$, where $IFS(R)$ denotes the set of all fuzzy subsets of R.

Definition 3.8

Definition 3.9

If μ is a fuzzy k-ideal of a semiring R, then μ is said to have a fuzzy primary decomposition if μ can be expressed as $\mu = \cap_{i=1}^{n} \mu_i$, where each μ_i is a fuzzy primary ideal of R. A fuzzy primary decomposition $\mu = \cap_{i=1}^{n} \mu_i$ is said to be reduced if $\sqrt{\mu_i}$'s are distinct and $\cap_{j \neq i}^{n} \mu_j \not\subseteq \mu_i$, for all $i = 1, 2 \cdots n$. By Kar et al. [22, Theorem 5.3], a reduced fuzzy primary decomposition can be obtained from a fuzzy primary decomposition $\mu = \cap_{i=1}^{n} \mu_i$, where each μ_i is a fuzzy primary ideal of R.

The primary decomposition proved for k-ideals in a commutative Noetherian semiring (Theorem 2.5) can be generalised to fuzzy k-ideals as in [22, Theorem 5.2]. Thus we have

Theorem 3.10

Fuzzy Primary Decomposition of Fuzzy k-Ideals

Let R be an additively cancellative, yoked and commutative Noetherian semiring and μ a fuzzy k-ideal of R such that $im\mu = \{1, \alpha\}$, where $\alpha \in [0, 1)$. Then μ can be represented as a finite intersection of fuzzy primary ideals of R, $i.e$, μ has a primary decomposition.

Similar to the primary decomposition of k-ideals in semirings, all μ_i's in the fuzzy primary decomposition of μ have an additional property that these are also fuzzy k-ideals.

There are some errors (as mentioned below) in the result used for the proof of uniqueness of fuzzy primary decomposition of fuzzy k-ideals in semirings. So the question of establishing the result still remains unsolved. First, we state the result used for uniqueness.

Theorem 3.11

[22], Theorem 5.4

Let μ be a fuzzy k- ideal of a semiring R and $\mu = \cap_{i=1}^{n} \mu_i$ be a reduced fuzzy primary decomposition of μ. Let λ be a fuzzy k-prime ideal of R. Then $\lambda = \sqrt{\mu_i}$ for some $i = 1, 2 \cdots . n$ if and only if there exists a fuzzy k-ideal θ of R such that $\theta \not\subseteq \mu$ and $\sqrt{(\mu : \theta)} = \lambda$, i.e. $(\mu : \theta)$ is a fuzzy λ-primary ideal of R.

In the proof of above result, $\mu = \cap_{i=1}^{n} \mu_i$ is a reduced fuzzy primary decomposition of fuzzy k-ideal μ, so $\sqrt{\mu_i}$'s are distinct for each $i = 1, 2, \ldots . n$. But the authors have used $\sqrt{\mu_i} = \lambda$, for each $i = 1, 2, \ldots . n$ in the step $\sqrt{\bigcap_{i=1}^{n} (\mu_i : \theta)} = \bigcap_{i=1}^{n} \sqrt{(\mu_i : \theta)} = \bigcap_{i=1}^{n} \sqrt{\mu_i} = \bigcap_{i=1}^{n} \lambda = \lambda$ contrary to the

In order to establish a correct proof of the uniqueness of fuzzy primary decomposition of a fuzzy *k*-ideal in a semiring, first we need the following result:

Lemma 3.12

Let μ be a fuzzy $\nu-$ primary ideal of a semiring R and θ a fuzzy ideal of R. Then the following hold:

(i) If $\theta \subseteq \mu$, then $(\mu: \theta) = \chi_R$, where χ_R is the chai function on R;

(ii) If $\theta \not\subseteq \mu$, then $(\mu: \theta)$ is a fuzzy $\nu-$ primary ideal of R, i.e. $\sqrt{(\mu: \theta)} = \nu$.

Proof.

(i) Let $x \in R$ and $\theta \subseteq \mu$. Then we have $(\mu: \theta)(x) = \sup_{\lambda \in IFS(R)} \{\lambda(x) \mid \lambda \circ \theta \subseteq \mu\}$. Also,

$$\begin{aligned}(\chi_R \circ \theta)(x) &= \sup\{\min(\chi_R(y), \theta(z)) \mid x = yz\} \\ &= \sup\{\theta(z) \mid x = yz\} \\ &\leq \theta(x) \\ &\leq \mu(x)\end{aligned}$$

as $\theta \subseteq \mu$. Thus, by the definition of colon ideal and $(\chi_R \circ \theta) \subseteq \mu$, we get $(\mu: \theta) = \chi_R$.

(ii) Let $\theta \not\subseteq \mu$ and $\eta_1 \circ \eta_2 \subseteq (\mu: \theta)$ for some fuzzy ideals η_1 and η_2 of R. Then by the definition of fuzzy colon ideal, $\eta_1 \circ \eta_2 \circ \theta \subseteq \mu$. Since μ is a fuzzy $\nu-$ primary ideal of R and $\theta \not\subseteq \mu$, we have $\eta_1 \circ \eta_2 \subseteq \sqrt{\mu}$ which further implies that either $\eta_1 \subseteq \sqrt{\mu}$ or $\eta_2 \subseteq \sqrt{\mu}$, as $\sqrt{\mu}$ is a fuzzy prime ideal of R.

If $\eta_1 \subseteq \sqrt{\mu}$, then by Kar et al. [22, Lemma 3.2 (iii) and Lemma 5.2 (i)], $\sqrt{\mu} \subseteq \sqrt{(\mu: \theta)}$ implies that $\eta_1 \subseteq \sqrt{(\mu: \theta)}$. Similarly, if $\eta_2 \subseteq \sqrt{\mu}$, then we get $\eta_2 \subseteq \sqrt{(\mu: \theta)}$. Thus, $(\mu: \theta)$ is a fuzzy primary ideal of R.

We now show that $\sqrt{(\mu: \theta)} = \nu$. For this, let $x \in R$. Then

$$\begin{aligned}\sqrt{(\mu: \theta)}(x) &= \sup_{n \geq 1}\{(\mu: \theta)(x^n)\} \\ &= \sup_{n \geq 1}\left\{\sup_{\lambda \in IFS(R)}\{\lambda(x^n) \mid \lambda \circ \theta \subseteq \mu\}\right\} \\ &= \sup_{n \geq 1}\left\{\sup_{\lambda \in IFS(R)}\{\lambda(x^n) \mid \lambda \subseteq \sqrt{\mu}\}\right\} \text{ as } \theta \not\subseteq \mu \text{ and } \sqrt{\mu} \text{ is a} \\ &\leq \sup_{n \geq 1}\{\sqrt{\mu}(x^n)\} \\ &= \sqrt{\sqrt{\mu}}(x) = \sqrt{\mu}(x)\end{aligned}$$

fuzzy prime ideal of R. Thus, $\sqrt{(\mu: \theta)} \subseteq \sqrt{\mu}$. Also by Kar et al. [22, Lemma 3.2 (iii) and Lemma 5.2 (i)], $\sqrt{\mu} \subseteq \sqrt{(\mu: \theta)}$ implies that $\sqrt{(\mu: \theta)} = \sqrt{\mu} = \nu$.

Now, we give the correct proof of Theorem 3.11, which is required for the establishment of uniqueness of fuzzy primary decomposition of a fuzzy *k*- ideal of a semiring as follows:

Let *R* be an additively cancellative, yoked, zerosumfree and commutative Noetherian semiring, and μ a fuzzy *k*- ideal of *R* such that $im\mu = \{1, \alpha\}$, where $\alpha \in [0, 1)$. Let $\mu = \cap_{i=1}^{n} \mu_i$ be a reduced fuzzy primary decomposition of μ and λ be a fuzzy prime ideal of *R*. Then $\lambda = \sqrt{\mu_i}$, for some $i = 1, 2, \ldots, n$ if and only if there exists a fuzzy *k*-ideal θ of *R* such that $\theta \not\subseteq \mu$ and $\sqrt{(\mu : \theta)} = \lambda$, i.e. $(\mu : \theta)$ is a fuzzy λ-primary ideal of *R*.

Proof.

Let $\lambda = \sqrt{\mu_i}$, for some $i = 1, 2, \ldots, n$. As $\mu = \cap_{i=1}^{n} \mu_i$ is a reduced fuzzy *k*-primary decomposition of μ, so $\cap_{\substack{j=1 \\ j \neq i}}^{n} \mu_j \not\subseteq \mu_i$, for any $i \neq j$. Therefore, there exists some $x_i \in R$ such that $\cap_{\substack{j=1 \\ j \neq i}}^{n} \mu_j(x_i) > \mu_i(x_i)$. Assume that $\cap_{\substack{j=1 \\ j \neq i}}^{n} \mu_j(x_i) = a$, where $a \in [0, 1)$. We now establish a fuzzy subset θ of *R* as follows:

$\theta(x) = \begin{cases} a, & \text{if } x \in \langle x_i \rangle \\ 0, & \text{otherwise} \end{cases}$. By Lemma 3.8, the ideal $\langle x_i \rangle$ is a *k*-ideal as *R* is additively cancellative, yoked and zerosumfree, which clearly implies that θ is a fuzzy *k*-ideal of *R*. Also,

$\theta(x_i) = a = \underset{\substack{j=1 \\ j \neq i}}{\cap}^{n} \mu_j(x_i) > \mu_i(x_i) > \underset{i=1}{\cap}^{n} \mu_i(x_i) = \mu(x_i)$ implies that $\theta \not\subseteq \mu$ and $\theta \not\subseteq \mu_i$, for $i \neq j$. Further,

$\theta(x_i) = a = \underset{\substack{j=1 \\ j \neq i}}{\cap}^{n} \mu_j(x_i) = inf\{\mu_1(x_i), \mu_2(x_i), \ldots, \mu_{i-1}(x_i), \mu_{i+1}(x_i), \ldots . \mu_n(x_i)\} \leq \mu_j(x_i)$ for all $j \neq i$ and $j = 1, 2, \ldots n$. Now, we claim that $\theta \subseteq \mu_j$, for all $j \neq i$ and $j = 1, 2, \ldots, n$. Let $x = x_i y_i \in < x_i >$, for some $y_i \in R$. Then

$\theta(x) = \theta(x_i) \leq \mu_j(x_i) \leq \mu_j(x_i y_i) = \mu_j(x)$ implies that $\theta \subseteq \mu_j$ for all $j \neq i$ and $j = 1, 2, \ldots, n$. Thus, by Lemma 3.12 (i), we have

$(\mu_j : \theta) = \chi_R$, for all $j \neq i$, $j = 1, 2, \ldots, n$ and $\sqrt{(\mu_i : \theta)} = \sqrt{\mu_i} = \lambda$. Finally, by Kar et al. [22, Theorem 3.2 (v) and Lemma 5.2 (iii)], we get

$\sqrt{(\mu : \theta)} = \sqrt{\left(\underset{i=1}{\cap}^{n} \mu_i : \theta \right)} = \sqrt{\underset{i=1}{\cap}^{n} (\mu_i : \theta)} = \underset{i=1}{\cap}^{n} \sqrt{(\mu_i : \theta)} = \sqrt{(\mu_i : \theta)} = \lambda$.

Also by Lemma 3.12 (ii), $(\mu : \theta)$ is a fuzzy λ-primary ideal of *R*.

Conversely, assume that there exists a fuzzy *k*-ideal θ of *R* such that $\theta \not\subseteq \mu$ and $\sqrt{(\mu : \theta)} = \lambda$. As $\theta \not\subseteq \mu = \underset{i=1}{\cap}^{n} \mu_i$, we get $\theta \not\subseteq \mu_j$ for some $j \in \{1, 2 \cdots . n\}$ and by Lemma 3.12 (ii), we have $\sqrt{(\mu_j : \theta)} = \sqrt{\mu_j}$.

Also,

$\sqrt{(\mu : \theta)} = \underset{i=1}{\cap}^{n} \sqrt{(\mu_i : \theta)} = \lambda$ implies that $\underset{\substack{i=1 \\ i \neq j}}{\cap}^{n} \sqrt{(\mu_i : \theta)} \cap \sqrt{\mu_j} = \lambda$. Further,

$\bigcap_{\substack{i=1 \\ i\neq j}}\sqrt{\quad\quad}\sqrt{\quad}\Big/\quad\bigcap_{\substack{i=1 \\ i\neq j}}\sqrt{\quad\quad}\Big/\quad\sqrt{\quad}$

$\lambda = \bigcap_{i=1}^{n}\sqrt{(\mu_i:\theta)} \subseteq \bigcap_{\substack{i=1 \\ i\neq j}}^{n}\sqrt{(\mu_i:\theta)}$ implies that $\sqrt{\mu_j} \subseteq \lambda$, as λ is prime.

Also,

$\lambda = \sqrt{(\mu:\theta)} = \sqrt{\bigcap_{i=1}^{n}(\mu_i:\theta)} = \bigcap_{i=1}^{n}\sqrt{(\mu_i:\theta)} \subseteq \sqrt{(\mu_j:\theta)} = \sqrt{\mu_j}$. Thus, we get $\lambda = \sqrt{\mu_j}$ for some, $j \in \{1, 2\cdots . n\}$.

Finally, we are in a position to give the correct proof of uniqueness theorem of reduced fuzzy *k*-primary decomposition of a fuzzy *k*-ideal in semirings as follows:

Theorem 3.14

Uniqueness of Fuzzy Primary Decomposition

Let *R* be an additively cancellative, yoked, zerosumfree and commutative Noetherian semiring, and μ a fuzzy *k*-ideal of *R* such that $im\mu = \{1, \alpha\}$, where $\alpha \in [0, 1)$. Let $\mu = \cap_{i=1}^{n}\mu_i$ with $\sqrt{\mu_i} = \nu_i$ for $i = 1, 2, \ldots . n$ and $\mu = \cap_{i=1}^{m}\xi_i$ with $\sqrt{\xi_i} = \eta_i$ for $i = 1, 2, \ldots . m$ be two reduced fuzzy *k*- primary decompositions of μ. Then, $n = m$ and $\{\nu_1, \nu_2\cdots . \nu_n\} = \{\eta_1, \eta_2, \ldots . , \eta_m\}$.

Proof.

Let $\nu_i \in \{\nu_1, \nu_2\cdots . \nu_n\}$. Then by Theorem 3.13, there exists a fuzzy *k*-ideal θ of *R* such that $\theta \not\subseteq \mu$ and $\sqrt{(\mu:\theta)} = \sqrt{u_i} = \nu_i$ for some, $i \in \{1, 2, ..., n\}$. Also, since $\mu = \cap_{i=1}^{m}\xi_i$ with $\sqrt{\xi_i} = \eta_i$ for $i = 1, 2, \ldots . m$ is another reduced fuzzy *k*-primary decomposition of μ, therefore there exists some $j \in \{1, 2\cdots . m\}$ such that $\nu_i = \sqrt{(\mu:\theta)} = \sqrt{\xi_j} = \eta_j$. This implies that $\{\nu_1, \nu_2\cdots . \nu_n\} \subseteq \{\eta_1, \eta_2, \ldots . , \eta_m\}$ and so $n \leq m$. By reversing the role of ν_i and ξ_j, we get $\{\eta_1, \eta_2, \ldots . , \eta_m\} \subseteq \{\nu_1, \nu_2\cdots . \nu_n\}$ and $m \leq n$. Thus, $\{\nu_1, \nu_2\cdots . \nu_n\} = \{\eta_1, \eta_2, \ldots . , \eta_m\}$ and $n = m$.

4. Conclusions

All the results that hold good for ideals in rings may not be true for the ideals in semirings and not even for the *k*-ideals in semirings. But this fact was ignored by various mathematicians while generalising the Lasker-Noether's Theorem for semirings. This made Lescot [21] to establish weak primary decomposition for *k*-ideals in semirings in 2015. But the question of settling the primary decomposition for *k*- ideals still remained unsolved. In

Let *I* be a *k*-ideal of an additively cancellative, yoked and commutative Noetherian semiring *R*. Then *I* can be uniquely represented as a finite intersection of primary ideals of *R*, i.e.*I* has a unique reduced primary decomposition. The above said result is also generalised for fuzzy *k*-ideals of same class of semirings.

Ram Parkash Sharma

Professor Ram Parkash Sharma has a remarkable 33 years of academic career (including 29 years in Himachal Pradesh University) with Doctorate from Ramanujan Institute for Advanced Study in Mathematics, University of Madras, India and has published 60 research papers in reputed journals. Gold medallist in Masters, Prof. Sharma has been a dedicated and resolute researcher who has received highly prestigious fellowships, including UGC-JRF, Visiting Fellowship of Panjab University, Post-Doctoral Fellowship of NBHM, Department of Atomic Energy Govt. of India, SERC Visiting Fellowship, DST, Govt. India, Indian National Science Academy Fellowship, Hungarian Scholarship (Type-E) and most prestigious Commonwealth Fellowship (UK). Twelve Students have completed doctorate under his supervision.

D degrees from Himachal Pradesh University, Shimla, India. She was HPU Junior and Senior Research Fellow at the Department of Mathematics, Himachal Pradesh University, Shimla, India. During 2210–2016, she worked at Department of Higher education Himachal (India) as Assistant Professor in Mathematics. From 2016 to till date, she is working at the Himachal Pradesh University, Shimla, India. Presently she is working as an Assistant Professor at the Department of Mathematics, Himachal Pradesh University, Shimla, India. Her main scientific interests are ternary semirings, group action and derivations in semirings, distinguishing labelling and distinguishing numbers for group actions. She is the author/co-author of more than 15 scientific research papers and 1 book.

Richa Sharma

Richa Sharma obtained her M.Phil and Ph.D degrees from Himachal Pradesh University Shimla Himachal Pradesh, India. She was awarded HPU JRF and BSR fellowships. She was awarded gold medal in M.Phil. Presently she is working as an assistant professor at Government degree College Chintpurni Una India. She is the author/ co author of more than five research papers.

S. Kar

Professor S. Kar obtained his M.Sc. and Ph. D degrees from the University of Calcutta, Kolkata, India. He was a CSIR Junior and Senior Research Fellow at the Department of Pure Mathematics, University of Calcutta, Kolkata, India. During 2005–2009, he worked at P. R. M. S. Mahavidyalaya, Bankura, West Bengal, India. From 2009 to till date, he is working at the Jadavpur University, Kolkata, India. Presently he is working as a Professor at the Department of Mathematics, Jadavpur University, Kolkata, India. His main scientific interests are ternary algebras, ordered algebras, ring derivation theory and algebraic graph theory. He is the author/coauthor of more than 60 scientific research papers and 3 books. He visited many places in abroad like Indonesia, Thailand, Vietnam, Hong Kong for academic activities.

Abstract

In this paper, the notions of commutator and derivation in additively regular Γ-semirings with (A_2, Γ)-condition are introduced. We also characterize Jordan product for additively regular Γ-semiring and establish some results which investigate the relationship between commutators, derivations and inner derivations. In 1957, E.C. Posner has shown that if there exists a non-zero centralizing derivation in a prime ring R, then R is commutative. This result is extended in the frame work of derivations of prime additively regular Γ-semirings.

Keywords: semirings, Γ-semirings, additively regular Γ-semirings, derivations and commutators.

2010 Mathematics Subject Classification: 16Y60, 16Y99.

1. Introduction

The concept of derivation is quite old and plays vital role in algebraic geometry and algebra. The algebraists in this direction have studied the concept of derivation in semirings, Γ-rings and Γ-semirings. It is pertinent to note here that the results which are true for rings motivated the researchers to generalize the analogous results for derivations in Γ-rings and Γ-semirings. The concept of derivation in a prime Γ−ring was first introduced by Yang [12] in 1991. Over the years, the researchers studied the concept of derivation in Γ-rings and other algebraic structures [2, 3, 6]. The algebraic structure additively regular Γ-semiring

is a generalization of semirings [9, 10, 11], additively regular semirings [5], and Γ-rings.

There are some algebraic structures in which binary operation "multiplication" fails. For instance, let R be the set of all $m \times n$ matrices over a boolean semiring under usual addition and multiplication of matrices. One can easily examine that R is not closed under multiplication. This problem has attracted the attention of various mathematicians for a long period. Therefore, another algebraic structure Γ was introduced; for example, consider A is an additive semigroup consisting of all homomorphisms from a semiring R_1 to semiring R_2 and Γ is an additive semigroup consisting of all homomorphisms from R_2 to R_1. Here the product g_1hg_2 belongs to A for any arbitrary elements g_1, g_2 of A and h of Γ. So, A is closed under multiplication. The importance of aforementioned algebraic structure Γ motivated us to explore the structure of Γ-semirings.

Rao [7, 8] introduced the notion of Γ-semirings and additively inverse Γ-semirings. According to Rao, if R_Γ and Γ are additive commutative semigroups with identity elements 0_{R_Γ} and 0_Γ respectively, then R_Γ is said to be a Γ-semiring if there exists a map $R_\Gamma \times \Gamma \times R_\Gamma \longrightarrow R_\Gamma$, defined as $(x, \gamma, y) \longmapsto x\gamma y$ such that $x\alpha(y + z) = x\alpha y + x\alpha z$; $(x + y)\alpha z = x\alpha z + y\alpha z$; $x(\alpha + \beta)y = x\alpha y + x\beta y$; $(x\alpha y)\beta z = x\alpha(y\beta z)$; $x\gamma 0_{R_\Gamma} = 0_{R_\Gamma}\gamma x = 0_{R_\Gamma}$ and $x\gamma 0_\Gamma = 0_\Gamma\gamma x = 0_\Gamma$ $\forall\ x, y, z \in R_\Gamma$, $\alpha, \beta, \gamma \in \Gamma$. Further, a Γ-semiring R_Γ is said to be additively regular if for each element $x \in R_\Gamma$ there exists an element $x' \in R_\Gamma$ such that $x = x + x' + x$. If in addition the element x' is unique and $x' = x' + x + x'$, then R_Γ is called an additively inverse Γ-semiring. Such an element x' is called pseudo inverse of x. Consider $M = \{0, 1, 2, \ldots, 50\}$ and $R_\Gamma = \mathbb{Z} \times M = \{(a, r) : a \in \mathbb{Z},\ r \in M\}$. We define binary operations of addition $\oplus$ and multiplication $\odot$ by $(a, r) \oplus (b, s) = (a + b, \max(r, s))$ and $(a, r) \odot (b, s) = (ab, \min(r, s))$ for all $(a, r), (b, s) \in R_\Gamma$. Take $\Gamma = \{(0, m) : m \in M\}$ with same binary operations defined as above. One can easily check that R_Γ and Γ are additive commutative semigroups. Moreover, define map $R_\Gamma \times \Gamma \times R_\Gamma \longrightarrow R_\Gamma$ by $(a, r) \odot (0, m) \odot (b, s) = (0, \min(r, m, s))$. Then R_Γ is a Γ-semiring. Further, if we define the pseudo inverse of an element (a, r) of R_Γ by $(a, r)' = (-a, r)$. Then R_Γ is an additively inverse Γ-semiring. Throughout this article, additively inverse Γ-semiring along with 1 has been intensively explored and represented as "additively regular Γ-semiring" which will persuade the readers in its accuracy and truthfulness.

In present paper, we introduce and characterize the concept of derivations for additively regular Γ-semirings with (A_2, Γ)-condition. Here (A_2, Γ)-condition means that the sum of an element x of R_Γ and its pseudo inverse $x' \in R_\Gamma$ lies in the centre of R_Γ. For example, let $B = \{0, 1\}$ and $\Gamma = \{a, b\}$, where $0, 1$ and a, b are additively idempotent elements of R_Γ and Γ, respectively. Further, addition in B is defined by $0 + 1 = 1 = 1 + 0$ and in Γ by $a + b = b = b + a$. Moreover, a map $B \times \Gamma \times B \longrightarrow B$ is defined as $0a0 = 0a1 = 1a0 = 0b0 = 0b1 = 1b0 = 0$ and

$1a1 = 1b1 = 1$. Then B is an additively regular Γ-semiring with (A_2, Γ)-condition. Throughout this paper, R_Γ will denote an additively regular
(A_2, Γ)-condition. In continuation, the study of commutators f
ular Γ-semirings is also initiated which is the generalization of
of rings. In section 3, some fundamental identities for commutators of additively

regular Γ-semirings with (A_2, Γ)-condition.

2. Additively regular Γ-semiring with (A_2, Γ)-condition

In this section, we prove some basic results and examples of additively regular Γ-semirings with (A_2, Γ)-condition. First we define commutativity and primeness of additively regular Γ-semiring R_Γ.

Definition 2.1. An additively regular Γ-semiring R_Γ is said to be commutative if $x\gamma y = y\gamma x \ \forall\ x, y \in R_\Gamma, \gamma \in \Gamma$.

Definition 2.2. An additively regular Γ-semiring R_Γ is said to be prime if $x\Gamma R_\Gamma \Gamma y = 0$ implies that either $x = 0$ or $y = 0$.

Now, we give an example of an additively regular Γ-semiring which is both commutative as well as prime.

Example 2.3. Let $R_\Gamma = \{0, 1, u\}$ and $\Gamma = \{\alpha, \beta\}$. We define operations with the help of following tables:

+	0	1	u
0	0	1	u
1	1	1	u
u	u	u	u

+	α	β
α	α	β
β	β	β

α	0	1	u
0	0	0	0
1	0	1	u
u	0	u	u

β	0	1	u
0	0	0	0
1	0	1	u
u	0	u	u

Then R_Γ is an additively regular Γ-semiring with (A_2, Γ)-condition and $a' = a$ for all $a \in R_\Gamma$. From the tables, it is clear that additively regular Γ-semiring R_Γ is prime and commutative.

Note that every additively regular semiring S is an additively regular Γ-semiring with $\Gamma = S$.

Next two examples show that every additively regular Γ-semiring may not satisfy (A_2, Γ)-condition.

Example 2.4. Let R_Γ be the set of all 2×2 matrices over boolean semiring B, i.e., $M_{2\times 2}(B)$ and $\Gamma = \left\{ \begin{pmatrix} a & 0 \\ 0 & a \end{pmatrix} : a \in B \right\}$. Define a map $R_\Gamma \times \Gamma \times R_\Gamma \to R_\Gamma$ by $(x, \gamma, y) \longmapsto x\gamma y$ for all $x, y \in R_\Gamma, \gamma \in \Gamma$. We define pseudo inverse of an element of R_Γ as $\begin{pmatrix} a & b \\ c & d \end{pmatrix}' = \begin{pmatrix} a' & b' \\ c' & d' \end{pmatrix}$. Then R_Γ is an additively regular Γ-semiring which do not satisfy (A_2, Γ)-condition under the usual multiplication of matrices.

Example 2.5. Let R be a non commutative ring and S be an additively regular semiring. Then the set $K = \{(a, \alpha) : a \in R, \alpha \in S\}$ is a non commutative additively regular semiring with operations pointwise addition and pointwise multiplication. We define pseudo inverse of an element of K as $(a, \alpha)' = (-a, \alpha')$. Take $\Gamma = \{(0, \beta) : 0 \in R, \beta \in S\}$ with operations pointwise addition and pointwise multiplication. Then Γ is an additive commutative semigroup. Further, define a map $K \times \Gamma \times K \to K$ by $(x, \gamma, y) = x\gamma y$ for all $x, y \in K, \gamma \in \Gamma$. Then K is an additively regular Γ-semiring.

Note that K satisfies (A_2, Γ)-condition only if S is commutative.

Throughout this paper, we consider an assumption $(*)$ $x\alpha y\beta z = x\beta y\alpha z$ for all $x, y, z \in R_\Gamma$ and $\alpha, \beta \in \Gamma$.

Lemma 2.6 [(Theorem 12, [8])]. *Let R_Γ be an additively regular Γ-semiring and $a, b \in R_\Gamma$, $\gamma \in \Gamma$. Then we have the following:*

(i) $a'' = a$,
(ii) $(a + b)' = a' + b'$,
(iii) $(a\gamma b)' = a'\gamma b = a\gamma b'$,
(iv) $a'\gamma b' = (a'\gamma b)' = (a\gamma b)'' = a\gamma b$.

additively regular Γ*-semiring.*

Proof. Let R_Γ be an additively regular Γ-semiring and $Z(R_\Gamma)$ be its centre. The map $Z(R_\Gamma) \times \Gamma \times Z(R_\Gamma) \longrightarrow Z(R_\Gamma)$ defined by $(a, \alpha, b) \longmapsto a\alpha b \ \forall\ a, b \in Z(R_\Gamma)$, $\alpha \in \Gamma$ is well defined map. Clearly, $Z(R_\Gamma)$ is an additive commutative semigroup and satisfies all the properties of Γ-semiring and hence $Z(R_\Gamma)$ is a Γ-semiring. Further, let $a \in Z(R_\Gamma)$. Then $a\gamma x = x\gamma a \ \forall\ x \in R_\Gamma, \gamma \in \Gamma$ implies that $(a\gamma x)' = (x\gamma a)'$, i.e., $a'\gamma x = x\gamma a' \ \forall\ x \in R_\Gamma, \gamma \in \Gamma$ and hence $a' \in Z(R_\Gamma)$. This completes the proof. ■

Remark 2.9. Let R_Γ be an additively regular Γ-semiring and X be a non-empty set. If $Map(X, R_\Gamma)$ is the set of all mappings from X into R_Γ, then define '+' in $Map(X, R_\Gamma)$ as $(f + g)(x) = f(x) + g(x) \ \forall\ f, g \in Map(X, R_\Gamma)$ and $Map(X, R_\Gamma) \times \Gamma \times Map(X, R_\Gamma) \longrightarrow Map(X, R_\Gamma)$ as $(f, \gamma, g) \longmapsto f\gamma g$ where $f\gamma g : X \longrightarrow R_\Gamma$ is defined by $(f\gamma g)(x) = f\ (x)\gamma g(x) \ \forall f, g \in Map(X, R_\Gamma)$, $\gamma \in \Gamma, x \in X$. Then $Map(X, R_\Gamma)$ is a Γ-semiring. Define $f' : X \longrightarrow R_\Gamma$ by $f'(x) = (f(x))'$ for each $f \in Map(X, R_\Gamma)$. Then it can be easily checked that f' is pseudo inverse of f and $f' \in Map(X, R_\Gamma)$ for each $f \in Map(X, R_\Gamma)$. Thus, $Map(X, R_\Gamma)$ is an additively regular Γ-semiring.

The proofs of the next two propositions are quite easy so we omit the proofs.

Proposition 2.10. *If R_Γ is an additively regular* Γ*-semiring, then $R_\Gamma[x]$ the set of all polynomials over R_Γ is an additively regular* Γ*-semiring.*

Proposition 2.11. *Let R_{Γ_1} be an additively regular Γ_1-semiring and R_{Γ_2} be an additively regular Γ_2-semiring. Then $R_\Gamma = R_{\Gamma_1} \times R_{\Gamma_2} = \{(r, s) : r \in R_{\Gamma_1}, s \in R_{\Gamma_2}\}$ is an additively regular $\Gamma = \Gamma_1 \times \Gamma_2$-semiring.*

3. Commutators of additively regular Γ-semirings

In this section, we introduce the concept of α-commutator for additively regular Γ-semirings and generalize some results of commutators of rings.

Definition 3.1. Let R_Γ be an additively regular Γ-semiring and α be a fixed element of Γ. We define α-commutator as a mapping $[,]_\alpha : R_\Gamma \times \Gamma \times R_\Gamma \to R_\Gamma$ by $[x, y]_\alpha = x\alpha y + (y\alpha x)' = x\alpha y + y'\alpha x = x\alpha y + y\alpha x'$ for all $x, y \in R_\Gamma$. Then $[x, y]_\alpha$ is called α- commutator of x, y.

For convenience, we denote $x + x'$ by $x_\circ$ for each $x \in R_\Gamma$. Then clearly $x_\circ + x_\circ = x_\circ = x'_\circ$; $x + x_\circ = x$ and $x' + x_\circ = x'$.

Lemma 3.2. *If R_Γ is an additively regular* Γ*-semiring, then $(x\gamma y)_\circ = x_\circ\gamma y = x\gamma y_\circ = x_\circ\gamma y_\circ = y_\circ\gamma x_\circ = (y\gamma x)_\circ \ \forall\ x, y \in R_\Gamma, \gamma \in \Gamma$.*

Proof. By using Lemma 2.6, we have $(x\gamma y)_\circ = x\gamma y + x'\gamma y = x_\circ\gamma y$. Similarly, $(x\gamma y)_\circ = x\gamma y_\circ$. Now, $x_\circ\gamma y_\circ = (x + x')\gamma\,(y + y') = x\gamma y + x\gamma y' + x'\gamma y + x'\gamma y' = x\gamma y + x\gamma y' + x'\gamma y + x\gamma y = x\gamma y + x'\gamma y = x_\circ\gamma y$. Similarly, $y\gamma x_\circ = y_\circ\gamma x = y_\circ\gamma x_\circ = (y\gamma x)_\circ$. By (A_2, Γ)-condition, we have $x_\circ = x + x' \in Z(R_\Gamma)$. Thus $x_\circ\gamma y = y\gamma x_\circ$. Hence $(x\gamma y)_\circ = x_\circ\gamma y = x\gamma y_\circ = x_\circ\gamma y_\circ = y_\circ\gamma x_\circ = (y\gamma x)_\circ$. ■

In the next Theorem, we generalize some basic commutator identities of rings for additively regular Γ-semirings.

Theorem 3.3. *Let R_Γ be an additively regular Γ-semiring. Then for all $x, y, z, x_1, x_2, y_1, y_2 \in R_\Gamma$ and $\alpha, \beta \in \Gamma$, the following identities hold:*

(i) $[x + y, z]_\alpha = [x, z]_\alpha + [y, z]_\alpha$.
(ii) $[x, y + z]_\alpha = [x, y]_\alpha + [x, z]_\alpha$.
(iii) $[x, 0_{R_\Gamma}]_\alpha = [0_{R_\Gamma}, x]_\alpha = 0_{R_\Gamma}$.
(iv) $[x_1 + x_2, y_1 + y_2]_\alpha = [x_1, y_1]_\alpha + [x_1, y_2]_\alpha + [x_2, y_1]_\alpha + [x_2, y_2]_\alpha$.
(v) $([x, y]_\alpha)' = [y, x]_\alpha = [x, y']_\alpha = [x', y]_\alpha$. (*Anti-commutativity*)
(vi) $[[x, y]_\alpha, z]_\beta = [x, y]_\alpha \beta z + z\beta[y, x]_\alpha$.
(vii) $[nx, y]_\alpha = n[x, y]_\alpha$, *for any positive integer* n.

Proof. One can easily prove the identities (i) to (iv) by using Definition 3.1.

(v) By Lemma 2.6 and Definition 3.1, we have $([x, y]_\alpha)' = (x\alpha y + y'\alpha x)' = x'\alpha y + y\alpha x = [y, x]_\alpha$. Again, $([x, y]_\alpha)' = (x\alpha y + y'\alpha x)' = x\alpha y' + y'\alpha x' = [x, y']_\alpha$. Now, $[x', y]_\alpha = x'\alpha y + y\alpha x'' = x'\alpha y + y\alpha x = [y, x]_\alpha$.

(vi) Using Definition 3.1 and (v), we have $[[x, y]_\alpha, z]_\beta = [x, y]_\alpha \beta z + z\beta([x, y]_\alpha)' = [x, y]_\alpha \beta z + z\beta[y, x]_\alpha$.

(vii) By Lemma 2.6 and Definition 3.1, we have $[nx, y]_\alpha = nx\alpha y + y'\alpha nx = n(x\alpha y + y'\alpha x) = n[x, y]_\alpha$. ∎

Theorem 3.4. *Let R_Γ be an additively regular Γ-semiring. Then for all $x, y, z, u \in R_\Gamma$ and $\alpha, \beta, \gamma \in \Gamma$, the following identities are valid:*

(i) $[x, y\beta z]_\alpha = [x, y]_\alpha \beta z + y\beta[x, z]_\alpha$.
(ii) $[x\beta y, z]_\alpha = x\beta[y, z]_\alpha + [x, z]_\alpha \beta y$.
(iii) $[x\beta y, z\gamma u]_\alpha = x\beta[y, z]_\alpha \gamma u + [x, z]_\alpha \beta y\gamma u + z\gamma x\beta[y, u]_\alpha + z\gamma[x, u]_\alpha \beta y$.

Proof. (i) By assumption (*) and Definition 3.1, we have $[x, y\beta z]_\alpha = x\alpha y\beta z + y\beta z\alpha x' = x\alpha y\beta z + y\beta z\alpha(x' + x) + y\beta z\alpha x' = x\alpha y\beta z + y\beta(x' + x)\alpha z + y\beta z\alpha x' = x\alpha y\beta z + y\beta x'\alpha z + y\beta x\alpha z + y\beta z\alpha x' = x\alpha y\beta z + y\alpha x'\beta z + y\beta x\alpha z + y\beta z\alpha x' = [x, y]_\alpha \beta z + y\beta[x, z]_\alpha$.

Similarly we can prove (ii).

(iii) By using Definition 3.1, Lemma 2.6, Lemma 3.2 and assumption $(*)$ we have $[x\beta y, z\gamma u]_\alpha = x\beta y\alpha z\gamma u + z'\gamma u\alpha x\beta y = x\beta y\alpha z\gamma u + (z' + z + z')\gamma u\alpha x\beta y + z_\circ\gamma u\alpha x\beta y = x\beta y\alpha z\gamma u + z'\gamma u\alpha x\beta y + z_\circ\gamma u\alpha x\beta y + (z\gamma u)_\circ\alpha x\beta y = x\beta y\alpha z\gamma u + z'\gamma u\alpha x\beta y + (z\gamma u)_\circ\alpha x\beta y + x\beta(z\gamma u)_\circ\alpha y = x\beta y\alpha z\gamma u + z'\gamma u\alpha x\beta y + z\gamma u_\circ\alpha x\beta y + x\beta z\gamma u_\circ\alpha y = x\beta y\alpha z\gamma u + z'\gamma u\alpha x\beta y + z\gamma x\alpha u_\circ\beta y + x\beta z\alpha(y\gamma u)_\circ = x\beta y\alpha z\gamma u + z'\gamma u\alpha x\beta y + z\gamma x\alpha u\beta y + z\gamma x\alpha(u' + u_\circ)\beta y + x\beta z\alpha y_\circ\gamma u = x\beta[y, z]_\alpha \gamma u + z\gamma u\alpha x'\beta y + z\gamma x\alpha u\beta y + z\gamma x\beta u'\alpha y + z\gamma x\beta y\alpha u + z\gamma x\beta y\alpha u' + x\beta z\alpha y\gamma u = x\beta[y, z]_\alpha \gamma u + z\gamma[x, u]_\alpha \beta y + z\gamma x\beta[y, u]_\alpha + z\alpha x'\beta y\gamma u + x\alpha z\beta y\gamma u = x\beta[y, z]_\alpha \gamma u + [x, z]_\alpha \beta y\gamma u + z\gamma x\beta[y, u]_\alpha + z\gamma[x, u]_\alpha \beta y$. ∎

Note that by assumption $(*)$, we have $[x, y]_\alpha \beta z = [x, y]_\beta \alpha z$ and $x\alpha[y, z]_\beta = x\beta[y, z]_\alpha$ for all $x, y, z \in R_\Gamma, \alpha, \beta \in \Gamma$.

Now, we generalize the Jacobian identity of rings for additively regular Γ-semirings which might be useful to develop Lie type theory for additively regular Γ-semirings.

Theorem 3.5. *If R_Γ is an additively regular Γ-semiring, then $[x, [y, z]_\alpha]_\beta + [y, [z, x]_\alpha]_\beta = [[x, y]_\alpha, z]_\beta$ holds for all $x, y, z \in R_\Gamma, \alpha, \beta \in \Gamma$.*

Proof. Using Lemma 2.6, Lemma 3.2, Definition 3.1 and Th
have $[x, [y, z]_\alpha]_\beta = ([[y, z]_\alpha, x]_\beta)' = [z, y]_\alpha \beta x + x\beta[y, z]_\alpha$ for all x
Γ. Similarly $[y, [z, x]_\alpha]_\beta = [x, z]_\alpha \beta y + y\beta[z, x]_\alpha$. Therefore, $[x, [y,$
$= [z, y]_\alpha \beta x + x\beta[y, z]_\alpha + [x, z]_\alpha \beta y + y\beta[z, x]_\alpha = z\alpha y\beta x + y'\alpha z\beta x +$

Accessibility Menu

Theorem 3.6. *If R_Γ is an additively regular Γ-semiring, then for all $x, y, z \in R_\Gamma$ and $\alpha, \beta, \gamma \in \Gamma$, the following identities hold:*

(i) $[x\alpha y, z]_\beta + [y\alpha z, x]_\beta + [z\alpha x, y]_\beta = [x, [y, z]_\alpha]_\beta + [y, [z, x]_\alpha]_\beta + [z, [x, y]_\alpha]_\beta$.

(ii) $[x\alpha y\beta z, u]_\gamma = x\alpha y\beta[z, u]_\gamma + x\alpha[y, u]_\gamma\beta z + [x, u]_\gamma\alpha y\beta z$.

(iii) $[x, y\beta z\gamma u]_\alpha = [x, y]_\alpha\beta z\gamma u + y\beta[x, z]_\alpha\gamma u + y\beta z\gamma[x, u]_\alpha$.

Proof. (i) By using Definition 3.1, Theorem 3.3(v) and Theorem 3.4(ii), $[x, [y, z]_\alpha]_\beta + [y, [z, x]_\alpha]_\beta + [z, [x, y]_\alpha]_\beta = x\beta[y, z]_\alpha + ([y, z]_\alpha)'\beta x + y\beta[z, x]_\alpha + ([z, x]_\alpha)'\beta y + z\beta[x, y]_\alpha + ([x, y]_\alpha)'\beta z = x\alpha[y, z]_\beta + [z, y]_\beta\alpha x + y\alpha[z, x]_\beta + [x, z]_\beta\alpha y + z\alpha[x, y]_\beta + [y, x]_\beta\alpha z = [x\alpha y, z]_\beta + [y\alpha z, x]_\beta + [z\alpha x, y]_\beta$.

(ii) By Definition 3.1 and Lemma 3.2 we have $x\alpha y\beta[z, u]_\gamma + x\alpha[y, u]_\gamma\beta z + [x, u]_\gamma\alpha y\beta z = x\alpha y\beta z\gamma u + x\alpha y\beta u'\gamma z + x\alpha y\gamma u\beta z + x\alpha u'\gamma y\beta z + x\gamma u\alpha y\beta z + u'\gamma x\alpha y\beta z = x\alpha y\beta z\gamma u + x\alpha y\beta u_\circ\gamma z + x\alpha u_\circ\gamma y\beta z + u'\gamma x\alpha y\beta z = x\alpha y\beta z\gamma u + x\alpha y\beta z\gamma u_\circ + u_\circ\alpha x\gamma y\beta z + u'\gamma x\alpha y\beta z = x\alpha y\beta z\gamma u + u'\gamma x\alpha y\beta z = [x\alpha y\beta z, u]_\gamma$.

Similarly we can prove (iii). ■

Theorem 3.7. *If R_Γ is an additively regular Γ-semiring, then for all $x, y, x_1, x_2, \ldots, x_n, y_1, y_2, \ldots, y_n \in R_\Gamma$ and $\alpha, \beta_1, \beta_2, \ldots, \beta_{n-1} \in \Gamma$, the following identities are valid:*

(i) $[x, y_1\beta_1 y_2\beta_2 \cdots \beta_{n-1}y_n]_\alpha = [x, y_1]_\alpha\beta_1 y_2\beta_2 \cdots \beta_{n-1}y_n + y_1\beta_1[x, y_2]_\alpha\beta_2 \cdots \beta_{n-1}y_n + \cdots + y_1\beta_1 y_2\beta_2 \cdots \beta_{n-1}[x, y_n]_\alpha$

(ii) $[x_1\beta_1 x_2\beta_2 \cdots \beta_{n-1}x_n, y]_\alpha = x_1\beta_1 x_2\beta_2 \cdots \beta_{n-1}[x_n, y]_\alpha + x_1\beta_1 x_2\beta_2 \cdots \beta_{n-2}[x_{n-1}, y]_\alpha\beta_{n-1}x_n + \cdots + [x_1, y]_\alpha\beta_1 x_2\beta_2 \cdots \beta_{n-1}x_n$.

Proof. (i) We will prove the result by using induction on n, the result is already true for $n = 2, 3$ from Theorem 3.4(i) and Theorem 3.6(iii). Now assume that the result is true for $n = k - 1$, i.e., $[x, y_1\beta_1 y_2\beta_2 \cdots \beta_{k-2}y_{k-1}]_\alpha = [x, y_1]_\alpha\beta_1 y_2\beta_2 \cdots \beta_{k-2}y_{k-1} + y_1\beta_1[x, y_2]_\alpha\beta_2 \cdots \beta_{k-2}y_{k-1} + \cdots + y_1\beta_1 y_2\beta_2 \cdots \beta_{k-2}[x, y_{k-1}]_\alpha$. For $n = k$, by using Theorem 3.4(i) and induction hypothesis, we have $[x, y_1\beta_1 y_2\beta_2 \cdots \beta_{k-1}y_k]_\alpha = [x, (y_1\beta_1 y_2\beta_2 \cdots \beta_{k-2}y_{k-1})\beta_{k-1}y_k]_\alpha = [x, y_1\beta_1 y_2\beta_2 \cdots \beta_{k-2}y_{k-1}]_\alpha\beta_{k-1}y_k + y_1\beta_1 y_2\beta_2 \cdots \beta_{k-2}y_{k-1}\beta_{k-1}[x, y_k]_\alpha = [x, y_1]_\alpha\beta_1 y_2\beta_2 \cdots \beta_{k-1}y_k + y_1\beta_1[x, y_2]_\alpha\beta_2 \cdots \beta_{k-1}y_k + \cdots + y_1\beta_1 y_2\beta_2 \cdots \beta_{k-1}[x, y_k]_\alpha$.

Similarly we can prove (ii). ■

The following identities are generalizations of commutator identities of ring theory (c.f. [1, 4]).

Proposition 3.8. *Let R_Γ be an additively regular Γ-semiring. Then for all $x, y, z \in R_\Gamma, \alpha, \beta, \gamma \in \Gamma$, the following identities hold:*

(i) $[x\alpha y, z]_\beta + [y\alpha z, x]_\beta = [y, z\alpha x]_\beta$

(ii) $[x\alpha y\beta z, u]_\gamma + [y\alpha z\beta u, x]_\gamma + [z\alpha u\beta x, y]_\gamma = [z, u\alpha x\beta y]_\gamma$.

Proof. (i) By using Lemma 2.6, Definition 3.1 and Lemma 3.2, (i) becomes $[x\alpha y, z]_\beta + [y\alpha z, x]_\beta = x\alpha y\beta z + z'\beta x\alpha y + y\alpha z\beta x + x\beta y\alpha z' = z'\beta x\alpha y + y\alpha z\beta x + x\beta y\alpha z_\circ = z'\beta x\alpha y + y\alpha z\beta x + z_\circ\beta x\alpha y = y\alpha z\beta x + z'\beta x\alpha y = y\beta z\alpha x + z'\alpha x\beta y = [y, z\alpha x]_\beta$.

(ii) By Lemma 2.6, Definition 3.1 and Lemma 3.2, (ii) reduces to $[x\alpha y\beta z, u]_\gamma + [y\alpha z\beta u, x]_\gamma + [z\alpha u\beta x, y]_\gamma = x\alpha y\beta z\gamma u + u'\gamma x\alpha y\beta z + y\alpha z\beta u\gamma x + x\gamma y\alpha z\beta u' + z\alpha u\beta x\gamma y + y'\gamma z\alpha u\beta x = x\alpha y\beta z\gamma u_\circ + u'\gamma x\alpha y\beta z + z\alpha u\beta x\gamma y + y_\circ\alpha z\beta u\gamma x = u_\circ\gamma x\alpha y\beta z + u'\gamma x\alpha y\beta z + z\beta u\gamma x\alpha y_\circ + z\beta u\gamma x\alpha y = u'\gamma x\alpha y\beta z + z\beta u\gamma x\alpha y = u'\alpha x\beta y\gamma z + z\gamma u\alpha x\beta y = [z, u\alpha x\beta y]_\gamma$. ■

Definition 3.9. Let α be a fixed element of Γ. Then we define α-Jordan product as $(x \circ y)_\alpha = x\alpha y + y\alpha x$ for all $x, y \in R_\Gamma$.

Proposition 3.10. *Let R_Γ be an additively regular Γ-semiring. Then for all $x, y, z \in R_\Gamma, \alpha, \beta \in \Gamma$, the following α-Jordan identities hold:*

(i) $(x \circ y)_\alpha = (y \circ x)_\alpha$

(ii) $((x + y) \circ z)_\alpha = (x \circ z)_\alpha + (y \circ z)_\alpha$

(iii) $[(x \circ y)_\alpha, z]_\beta + [(y \circ z)_\alpha, x]_\beta = [y, (z \circ x)_\alpha]_\beta$.

$y\beta z\alpha x + y_o\beta z\alpha x + y\beta x\alpha z + y_o\beta x\alpha z + (z \circ x)_\alpha\beta y' = y\beta(z\alpha x + x\alpha z) + (z \circ x)_\alpha\beta y' =$
$[y, (z \circ x)_\alpha]_\beta$. ■

Proposition 3.11. *Let R_Γ be an additively regular Γ-semiring. Then for all $x, y, z \in R_\Gamma$ and $\alpha, \beta \in \Gamma$, the α-Jordan identity $(x \circ [y, z]_\beta)_\alpha + ([x, z]_\beta \circ y)_\alpha = [(x \circ y)_\alpha, z]_\beta$ holds.*

Proof. By Lemma 2.6, Definition 3.1 and Definition 3.9, the left hand side reduces to $(x \circ [y, z]_\beta)_\alpha + ([x, z]_\beta \circ y)_\alpha = (x \circ (y\beta z + z'\beta y))_\alpha + ((x\beta z + z'\beta x) \circ y)_\alpha = x\alpha y\beta z + x\alpha z'\beta y + y\beta z\alpha x + z'\beta y\alpha x + x\beta z\alpha y + z'\beta x\alpha y + y\alpha x\beta z + y\alpha z'\beta = (x\alpha y + y\alpha x)\beta z + x\alpha(z + z')\beta y + y\beta(z + z')\alpha x + z'\beta y\alpha x + z'\beta x\alpha y = (\ x \circ y)_\alpha\beta z + z_o\beta x\alpha y + z_o\beta y\alpha x + z'\beta x\alpha y + z'\beta y\alpha x = (\ x \circ y)_\alpha\beta z + z'\beta(x\alpha y + y\alpha x) = [(x \circ y)_\alpha, z]_\beta$. ■

4. Derivations of additively regular Γ-semiring

In this section, we introduce the concept of derivation and inner derivation in additively regular Γ-semiring. Also, we establish the relationships between commutators and derivations of additively regular Γ-semirings.

Definition 4.1. A map $d : R_\Gamma \to R_\Gamma$ is called a derivation of additively regular Γ-semiring R_Γ if d is additive and d satisfies $d(x\gamma y) = d(x)\gamma y + x\gamma d(y)$ for all $x, y \in R_\Gamma, \gamma \in \Gamma$.

Example 4.2. Let R be an additively regular Γ-semiring. Take $R_\Gamma = \left\{ \begin{pmatrix} a & b \\ 0 & c \end{pmatrix} : a, b, c \in R \right\}$ and $\Gamma = \left\{ \begin{pmatrix} a & 0 \\ 0 & a \end{pmatrix} : a \in R \right\}$. Define a map $R_\Gamma \times \Gamma \times R_\Gamma \to R_\Gamma$ by $(x, \gamma, y) \longmapsto x\gamma y \ \forall\ x, y \in R_\Gamma, \gamma \in \Gamma$. Then R_Γ is an additively regular Γ-semiring under the usual multiplication of matrices. Define $d : R_\Gamma \to R_\Gamma$ by $d\begin{pmatrix} a & b \\ 0 & c \end{pmatrix} = \begin{pmatrix} 0 & b \\ 0 & 0 \end{pmatrix}$, then d is a derivation on R_Γ.

Example 4.3. Let R_Γ be an additively regular Γ-semiring. Then by Proposition 2.10, $R_\Gamma[x]$ is also an additively regular Γ-semiring. We define $d : R_\Gamma[x] \to R_\Gamma[x]$ by $d(a_0 + a_1x + a_2x^2 + a_3x^3 + \cdots) = a_1 + 2a_2x + 3a_3x^2 + \cdots$ for all $a_0 + a_1x + a_2x^2 + a_3x^3 + \cdots \in R_\Gamma[x]$. Then d is a derivation on $R_\Gamma[x]$.

Definition 4.4. Let R_Γ be an additively regular Γ-semiring and a be a fixed element of R_Γ and α be a fixed element of Γ. Define $d : R_\Gamma \to R_\Gamma$ by $d(x) = [a, x]_\alpha$, for all $x \in R_\Gamma$. The function d so defined can be easily checked to be additive and $d(x\gamma y) = [a, x\gamma y]_\alpha = x\gamma[a, y]_\alpha + [a, x]_\alpha\gamma y = x\gamma d(y) + d(x)\gamma y$ for all $x, y \in R_\Gamma, \gamma \in \Gamma$. Thus, d is a derivation which is called inner derivation of R_Γ determined by a and α.

Proposition 4.6. *If R_Γ is an additively regular Γ-semiring and d is a derivation on R_Γ, then*

(i) $d(x') = (d(x))' \ \forall\ x \in R_\Gamma$.

(ii) $d' : R_\Gamma \to R_\Gamma$ *is also a derivation on* R_Γ.

Proposition 4.7. *If R_Γ is an additively regular Γ-semiring and d is a derivation on R_Γ, then $d(x\gamma y) = d(x'\gamma y'),\ \forall\ x, y \in R_\Gamma, \gamma \in \Gamma$.*

Proof. Let $x, y \in R_\Gamma, \gamma \in \Gamma$. Then by using Lemma 2.6 and Proposition 4.6(i), we have $d(x'\gamma y') = d(x')\gamma y' + x'\gamma d(y') = (d(x))'\gamma y' + x'\gamma(d(y))' = d(x)\gamma y + x\gamma d(y) = d(x\gamma y)$. ■

Theorem 4.8. *If R_Γ is an additively regular Γ-semiring, $a \in R_\Gamma, \alpha \in \Gamma$ and d is an inner derivation determined by a and α, i.e., $d(x) = [a, x]_\alpha$, for all $x \in R_\Gamma$, then $[x\beta y, z]^d_\gamma + [y\beta z, x]^d_\gamma = [y, z\beta x]^d_\gamma$ for all $x, y, z \in R_\Gamma, \beta, \gamma \in \Gamma$.*

Proof. By Lemma 2.6, Definition 3.1 and Remark 4.5, the left hand side reduces to $[x\beta y, z]^d_\gamma + [y\beta z, x]^d_\gamma = [a, [x\beta y, z]_\gamma]_\alpha + [a, [y\beta z, x]_\gamma]_\alpha = a\alpha(x\beta y\gamma z + z'\gamma x\beta y) + (x\beta y\gamma z + z'\gamma x\beta y)\alpha a' + a\alpha(y\beta z\gamma x + x'\gamma y\beta z) + (y\beta z\gamma x + x'\gamma y\beta z)\alpha a' = a\alpha(x+x')\beta y\gamma z + a\alpha z'\gamma x\beta y + (x+x')\beta y\gamma z\alpha a' + z'\gamma x\beta y\alpha a' + a\alpha y\beta z\gamma x + y\beta z\gamma x\alpha a' = a\alpha z'\gamma x\beta y + z'\gamma x\beta y\alpha a' + a\alpha y\gamma z\beta(x + x_\circ) + y\gamma z\beta(x + x_\circ)\alpha a' = a\alpha z'\beta x\gamma y + z'\beta x\gamma y\alpha a' + a\alpha y\gamma z\beta x + y\gamma z\beta x\alpha a' = [y, z\beta x]^d_\gamma$. ■

Proposition 4.9. *Let R_Γ be an additively regular Γ-semiring, $a \in R_\Gamma, \alpha \in \Gamma$ and d be an inner derivation determined by a and α, i.e., $d(x) = [a, x]_\alpha$ for all $x \in R_\Gamma$. Then for all $x, y, z, u \in R_\Gamma, \beta, \gamma, \delta \in \Gamma$, the following identities are valid:*

(i) $[x\beta y\gamma z, u]^d_\delta = (x\beta y\gamma[z, u]_\delta)^d + (x\beta[y, u]_\delta\gamma z)^d + ([x, u]_\delta\beta y\gamma z)^d$.

(ii) $[x\beta y\gamma z, u]^d_\delta + [y\beta z\gamma u, x]^d_\delta + [z\beta u\gamma x, y]^d_\delta = [z, u\beta x\gamma y]^d_\delta$.

Proof. (i) Taking right hand side of (i) and by using Lemma 2.6, Definition 3.1 and Remark 4.5, we get $(x\beta y\gamma[z, u]_\delta)^d + (x\beta[y, u]_\delta\gamma z)^d + ([x, u]_\delta\beta y\gamma z)^d = [a, x\beta y\gamma[z, u]_\delta]_\alpha + [a, x\beta[y, u]_\delta\gamma z]_\alpha + [a, [x, u]_\delta\beta y\gamma z]_\alpha = a\alpha x\beta y\gamma z\delta u + a\alpha x\beta y\gamma u\delta z' + x\beta y\gamma z\delta u\alpha a' + x\beta y\gamma u\delta z'\alpha a' + a\alpha x\beta y\delta u\gamma z + a\alpha x\beta u'\delta y\gamma z + x\beta y\delta u\gamma z\alpha a' + x\beta u'\delta y\gamma z\alpha a' + a\alpha x\delta u\beta y\gamma z + a\alpha u'\delta x\beta y\gamma z + x\delta u\beta y\gamma z\alpha a' + u'\delta x\beta y\gamma z\alpha a' = a\alpha x\beta y\gamma z\delta u + a\alpha u'\delta x\beta y\gamma z + x\beta y\gamma z\delta u\alpha a' + u'\delta x\beta y\gamma z\alpha a' + a\alpha x\beta y\gamma u\delta z_\circ + x\beta y\gamma u\delta z_\circ\alpha a' + a\alpha x\beta u_\circ\delta y\gamma z + x\beta u_\circ\delta y\gamma z\alpha a' = a\alpha x\beta y\gamma z\delta u + a\alpha u'\delta x\beta y\gamma z + x\beta y\gamma z\delta u\alpha a' + u'\delta x\beta y\gamma z\alpha a' + a\alpha x\beta y\gamma z_\circ\delta u + x\beta y\gamma z_\circ\delta u\alpha a' + a\alpha u_\circ\beta x\delta y\gamma z + u_\circ\beta x\delta y\gamma z\alpha a' = a\alpha x\beta y\gamma z\delta u + x\beta y\gamma z\delta u\alpha a' + a\alpha u'\delta x\beta y\gamma z + u'\delta x\beta y\gamma z\alpha a' = [a, [x\beta y\gamma z, u]_\delta]_\alpha = [x\beta y\gamma z, u]^d_\delta$.

(ii) Taking left hand side of (ii) and by using Lemma 2.6, Definition 3.1 and Remark 4.5, we have $[x\beta y\gamma z, u]^d_\delta + [y\beta z\gamma u, x]^d_\delta + [z\beta u\gamma x, y]^d_\delta = [a, [x\beta y\gamma z, u]_\delta]_\alpha + [a, [y\beta z\gamma u, x]_\delta]_\alpha + [a, [z\beta u\gamma x, y]_\delta]_\alpha = a\alpha x\beta y\gamma z\delta u + a\alpha u\delta x'\beta y\gamma z + x\beta y\gamma z\delta u\alpha a' + u\delta x'\beta y\gamma z\alpha a' + a\alpha y\beta z\gamma u\delta x + a\alpha x'\delta y\beta z\gamma u + y\beta z\gamma u\delta x\alpha a' + x'\delta y\beta z\gamma u\alpha a' + a\alpha z\beta u\gamma x\delta y + a\alpha y'\delta z\beta u\gamma x + z\beta u\gamma x\delta y\alpha a' + y'\delta z\beta u\gamma x\alpha a' = a\alpha x_\circ\beta y\gamma z\delta u + a\alpha y_\circ\beta z\gamma u\delta x + a\alpha u\delta x'\beta y\gamma z + a\alpha z\beta u\gamma x\delta y + x_\circ\beta y\gamma z\delta u\alpha a' + y_\circ\beta z\gamma u\delta x\alpha a' + u\delta x'\beta y\gamma z\alpha a' + z\beta u\gamma x\delta y\alpha a' = a\alpha u\delta x_\circ\beta y\gamma z + a\alpha u\delta x'\beta y\gamma z + a\alpha z\gamma u\delta x\beta y_\circ + a\alpha z\gamma u\delta x\beta y + u\delta x_\circ\beta y\gamma z\alpha a' + u\delta x'\beta y\gamma z\alpha a' + z\gamma u\delta x\beta y_\circ\alpha a' + z\gamma u\delta x\beta y\alpha a' = a\alpha u\delta x'\beta y\gamma z + a\alpha z\gamma u\delta x\beta y + u\delta x'\beta y\gamma z\alpha a' + z\gamma u\delta x\beta y\alpha a' = a\alpha(u\beta x'\gamma y\delta z + z\delta u\beta x\gamma y) + (u\beta x'\gamma y\delta z + z\delta u\beta x\gamma y)\alpha a' = [z, u\beta x\gamma y]^d_\delta$. ■

The next Theorem is the generalization of Jordan identity.

Theorem 4.10. *If R_Γ is an additively regular Γ-semiring, $a \in R_\Gamma, \alpha \in \Gamma$ and d is an inner derivation determined by a and α, then for all $x, y, z \in R_\Gamma, \beta, \gamma \in \Gamma$, the following identities hold:*

(i) $[(x \circ y)_\beta, z]^d_\gamma + [(y \circ z)_\beta, x]^d_\gamma = [y, (z \circ x)_\beta]^d_\gamma$.

(ii) $((x \circ [y, z]_\gamma)_\beta)^d + (([x, z]_\gamma \circ y)_\beta)^d = [(x \circ y)_\beta, z]^d_\gamma$.

Proof. (i) Using Lemma 2.6, Definition 3.1, Definition 3.9 and Remark 4.5, the left hand side of (i) becomes $[(x \circ y)_\beta, z]^d_\gamma + [(y \circ z)_\beta, x]^d_\gamma = [a, [(x \circ y)_\beta, z]_\gamma]_\alpha + [a, [(y \circ$

$y)_\beta, z]^d_\gamma$. ■

Next, we define a symmetric map.

Definition 4.11. Let R_Γ be an additively regular Γ-semiring. Then a mapping $B : R_\Gamma \times \Gamma \times R_\Gamma \to R_\Gamma$ is said to be symmetric, if $B(x, \gamma, y) = B(y, \gamma, x)$ for all $x, y \in R_\Gamma, \gamma \in \Gamma$.

Definition 4.12. A mapping $f : R_\Gamma \to R_\Gamma$ defined by $f(x) = B(x, \gamma, x)$ is called trace of B. Further, for an additively regular Γ-semiring R_Γ and derivation $d : R_\Gamma \to R_\Gamma$, we define a map $B_d : R_\Gamma \times \Gamma \times R_\Gamma \to R_\Gamma$ corresponding to derivation d as $B_d(x, \gamma, y) = [d(x), y]_\gamma + [d(y), x]_\gamma$ for all $x, y \in R_\Gamma, \gamma \in \Gamma$.

The following proposition shows that the mapping B_d is symmetric.

Proposition 4.13. *Let R_Γ be an additively regular Γ-semiring. Then following statements hold:*

(i) *If $d : R_\Gamma \to R_\Gamma$ is a derivation, then B_d is symmetric.*

(ii) *If f is trace of B_d, then $f(x+y) = f(x)+f(y)+2B_d(x, \gamma, y)$ for all $x, y \in R_\Gamma$.*

Proof. (i) By Definition 4.11 and Definition 4.12, we have $B_d(x, \gamma, y) = [d(x), y]_\gamma + [d(y), x]_\gamma = [d(y), x]_\gamma + [d(x), y]_\gamma = B_d(y, \gamma, x)$ for all $x, y \in R_\Gamma, \gamma \in \Gamma$. This shows that B_d is symmetric.

(ii) As $d : R_\Gamma \to R_\Gamma$ is a derivation, hence by Definition 4.12, we have $f(x+y) = B_d(x+y, \gamma, x+y) = [d(x+y), x+y]_\gamma + [d(x+y), x+y]_\gamma = [d(x), x]_\gamma +$
$[d(x), x]_\gamma + [d(y), y]_\gamma + [d(y), y]_\gamma + 2([d(x), y]_\gamma + [d(y), x]_\gamma) = B_d(x, \gamma, x) + B_d(y, \gamma, y)$
$+ 2B_d(x, \gamma, y) = f(x) + f(y) + 2B_d(x, \gamma, y)$. ■

Proposition 4.14. *Let R_Γ be an additively regular Γ-semiring and d be a derivation of R_Γ into itself. Then for all $x, y, z \in R_\Gamma, \beta, \gamma \in \Gamma$, we have $B_d(x, \gamma, z)\beta y + x\beta B_d(y, \gamma, z) = [z, d(x)]_\gamma \beta y' + x'\beta[z, d(y)]_\gamma + [d(z), x\beta y]_\gamma$.*

Proof. By Lemma 2.6, Definition 4.12, Theorem 3.4(i) and Theorem 3.3(v), we have $B_d(x, \gamma, z)\beta y + x\beta B_d(y, \gamma, z) = [d(x), z]_\gamma \beta y + [d(z), x]_\gamma \beta y + x\beta[d(y), z]_\gamma +$
$x\beta[d(z), y]_\gamma = [d(x), z']_\gamma \beta y' + x'\beta[d(y), z]'_\gamma + [d(z), x]_\gamma \beta y + x\beta[d(z), y]_\gamma = [z, d(x)]_\gamma$
$\beta y' + x'\beta[z, d(y)]_\gamma + [d(z), x\beta y]_\gamma$. ■

Theorem 4.15. *Let R_Γ be an additively regular Γ-semiring and d be a derivation of R_Γ into itself. Then $B_d(x\beta y, \gamma, z) = B_d(x, \gamma, z)\beta y + x\beta B_d(y, \gamma, z) +$
$d(x)\beta[y, z]_\gamma + [x, z]_\gamma \beta d(y)$ $\forall$ $x, y, z \in R_\Gamma, \beta, \gamma \in \Gamma$.*

Proof. By Definition 4.12, Lemma 2.6, Theorem 3.4(i) and Theorem 3.3, we have $B_d(x\beta y, \gamma, z) = [d(x\beta y), z]_\gamma + [d(z), x\beta y]_\gamma = [d(x)\beta y, z]_\gamma + [x\beta d(y), z]_\gamma +$
$[d(z), x\beta y]_\gamma = [z, d(x)\beta y']_\gamma + [z, x'\beta d(y)]_\gamma + [d(z), x\beta y]_\gamma = [z, d(x)]_\gamma \beta y' + x'\beta[z,$
$d(y)]_\gamma + d(x)\beta[y, z]_\gamma + [x, z]_\gamma \beta d(y) + [d(z), x]_\gamma \beta y + x\beta[d(z), y]_\gamma = B_d(x, \gamma, z)\beta y +$
$x\beta B_d(y, \gamma, z) + d(x)\beta[y, z]_\gamma + [x, z]_\gamma \beta d(y)$. ■

Proposition 4.16. *Let R_Γ be an additively regular Γ-semiring ι*
2 and d be a derivation of R_Γ into itself. Then d^2 is again a d

Accessibility Menu

sciendo Publish with us Subjects Publications Blog Contact

Proof. Let d be a derivation on R_Γ. Then clearly d^2 is additive and $d^2(x\gamma y) = d(d(x)\gamma y + x\gamma d(y)) = d(d(x))\gamma y + 2d(x)\gamma d(y) + x\gamma d(d(y)) = d^2(x)\gamma y + x\gamma d^2(y)$. ■

Lemma 4.17. *Let R_Γ be an additively regular Γ-semiring such that $[x,y]_\gamma = 0$ $\forall\ x, y \in R_\Gamma, \gamma \in \Gamma$. Then R_Γ is commutative.*

The proof of this lemma is quite easy so we omit the proof.

Definition 4.18. An additive mapping f of an additively regular Γ-semiring R_Γ is said to be centralizing if $[[f(x),x]_\alpha, y]_\beta = 0$ for all $x, y \in R_\Gamma, \alpha, \beta \in \Gamma$. Moreover, f is said to be commuting if $[f(x),x]_\alpha = 0$ for all $x \in R_\Gamma, \alpha \in \Gamma$.

Remark 4.19. Let f be a centralizing map on a prime additively regular Γ-semiring R_Γ. Then $[[f(x),x]_\alpha, y]_\beta = 0$ for all $x, y \in R_\Gamma, \alpha, \beta \in \Gamma$, that is, $[f(x),x]_\alpha \beta y + (y' + y)\beta[f(x),x]_\alpha = y\beta[f(x),x]_\alpha$ for all $x, y \in R_\Gamma, \alpha, \beta \in \Gamma$. So, (A_2, Γ)-condition implies that $[f(x),x]_\alpha$ belongs to the centre of R_Γ for all $x \in R_\Gamma, \alpha \in \Gamma$. Moreover, the definition of f forces $[[f(x),x]_\alpha, x]_\beta = 0$ for all $x \in R_\Gamma, \alpha, \beta \in \Gamma$, that is, for all $x \in R_\Gamma, \alpha, \beta \in \Gamma$ we have

$0 = [f(x),x]_\alpha \beta x + x'\beta[f(x),x]_\alpha = [f(x),x]_\alpha \beta(x + x')$, since $[f(x),x]_\alpha$ belongs to the centre of R_Γ.

Hence, $[f(x),x]_\alpha \Gamma(R_\Gamma + R'_\Gamma) = (0)$ leading to $[f(x),x]_\alpha \Gamma R_\Gamma = (0)$ for all $x \in R_\Gamma, \alpha \in \Gamma$ as R'_Γ is contained in R_Γ. Therefore, $[f(x),x]_\alpha \Gamma R_\Gamma \Gamma 1 = (0)$ for all $x \in R_\Gamma, \alpha \in \Gamma$. By using primeness of R_Γ we can conclude that $[f(x),x]_\alpha = 0$ for all $x \in R_\Gamma, \alpha \in \Gamma$. Therefore, every centralizing mapping of a prime additively regular Γ-semiring R_Γ is also commuting.

Theorem 4.20. *Let d be a non-zero derivation of prime additively regular Γ-semiring R_Γ such that $d([x,y]_\gamma) = 0$ for all $x, y \in R_\Gamma, \gamma \in \Gamma$. Then R_Γ is commutative.*

Proof. Let d be a derivation of R_Γ such that $d([x,y]_\gamma) = 0$ for all $x, y \in R_\Gamma$, $\gamma \in \Gamma$. Then by using Definitions 3.1 and 4.1, we are left with

$$\text{(i)} \qquad [d(x),y]_\gamma + [x,d(y)]_\gamma = 0 \text{ for all } x, y \in R_\Gamma,\ \gamma \in \Gamma.$$

By replacing y by $y\beta x$ in (i) and then using Definition 3.1, Theorem 3.4, Definition 4.1 and equation (i), we get $0 = [d(x), y\beta x]_\gamma + [x, d(y\beta x)]_\gamma = d(y)\beta[x,x]_\gamma + [x,y]_\gamma \beta d(x)$. So,

$$\text{(ii)} \qquad d(y)\beta[x,x]_\gamma + [x,y]_\gamma \beta d(x) = 0 \text{ for all } x, y \in R_\Gamma, \beta,\ \gamma \in \Gamma.$$

Replacing y by $r\alpha y$ in (ii) and then by using Theorem 3.4, Lemma 2.6, Lemma 3.2, equations (i) and (ii), we have $0 = d(r\alpha y)\beta[x,x]_\gamma + [x, r\alpha y]_\gamma \beta d(x) = [x,r]_\gamma \alpha y \beta d(x) + r\alpha[x,y]_\gamma \beta d(x) + d(r)\alpha y \beta[x,x]_\gamma + r\alpha d(y)\beta[x,x]_\gamma = (x\gamma r + r'\gamma x)\alpha y \beta d(x) + r_\circ \gamma x \alpha y \beta d(x) + d(r)\alpha y \beta x \gamma x_\circ = [x,r]_\gamma \alpha y \beta d(x) + d(r)\gamma(x + x')\alpha y \beta x + r\gamma x \alpha y \beta d(x) + r'\gamma x \alpha y \beta d(x) + r_\circ \gamma x \alpha y \beta d(x) = [x,r]_\gamma \alpha y \beta d(x) + d(r)\gamma(x + x_\circ)\alpha y \beta x +$

$d(r)\gamma x' \alpha y \beta x + r_\circ \gamma x \alpha y \beta d(x) + (d(x))'\gamma r \alpha y \beta x + d(x)\gamma r \alpha y \beta x =$
$(d(r)\gamma x + x'\gamma d(r))\alpha y \beta x + (x\gamma d(r) + d(r)\gamma x')\alpha y \beta x + (r\gamma d(x) +$
$(r'\gamma d(x) + d(x)\gamma r)\alpha y \beta x = [x,r]_\gamma \alpha y \beta d(x) + ([d(r),x]_\gamma + [r,d(x)]_\gamma)$
$+ [d(x),r]_\gamma)\alpha y \beta x = [x,r]_\gamma \alpha y \beta d(x)$ for all $x, y, r \in R_\Gamma, \alpha, \beta, \gamma \in \Gamma$. Then by

semiring R_Γ such that $[d(x), x]_\gamma = 0$ for all $x \in R_\Gamma, \gamma \in \Gamma$. Then R_Γ is commutative.

Proof. As $0 = [d(x+y), x+y]_\gamma = [d(x), y]_\gamma + [d(y), x]_\gamma$. Hence we have

(i) $$[d(x), y]_\gamma + [d(y), x]_\gamma = 0 \text{ for all } x, y \in R_\Gamma,\ \gamma \in \Gamma.$$

By replacing y by $y\beta x$ in (i) and then using Theorem 3.4 and equation (i), we get $0 = [d(x), y\beta x]_\gamma + [d(y\beta x), x]_\gamma = d(y)\,\beta[x, x]_\gamma + [y, x]_\gamma \beta d(x)$. So,

(ii) $$d(y)\,\beta[x, x]_\gamma + [y, x]_\gamma \beta d(x) = 0 \text{ for all } x, y \in R_\Gamma, \beta, \gamma \in \Gamma.$$

Replacing y by $r\alpha y$ in (ii) and then by using Theorem 3.4, Lemma 2.6, Lemma 3.2, equations (i) and (ii), we get $0 = [r\alpha y, x]_\gamma \beta d(x) + d(r\alpha y)\,\beta[x, x]_\gamma = [r, x]_\gamma \alpha y \beta d(x) + d(r)\alpha y \beta x \gamma x_\circ = [r, x]_\gamma \alpha y \beta d(x) + x_\circ \gamma r \alpha y \beta d(x) + d(r)\gamma(x + x')\alpha y \beta x = [r, x]_\gamma \alpha y \beta d(x) + (d(r)\gamma x + d(r)\gamma x_\circ)\alpha y \beta x + d(r)\gamma x' \alpha y \beta x + x\gamma r \alpha y \beta d(x) + x_\circ \gamma r \alpha y \beta d(x) + x' \gamma r \alpha y \beta d(x) = [r, x]_\gamma \alpha y \beta d(x) + [d(r), x]_\gamma \alpha y \beta x + x\gamma d(r) \alpha y \beta x + d(r)\gamma x' \alpha y \beta x + x_\circ \gamma r \alpha y \beta d(x) + r_\circ \gamma x \alpha y \beta d(x) = [r, x]_\gamma \alpha y \beta d(x) + [d(r), x]_\gamma \alpha y \beta x + [x, d(r)]_\gamma \alpha y \beta x + r_\circ \gamma d(x) \alpha y \beta x + d(x)\gamma r_\circ \alpha y \beta x = [r, x]_\gamma \alpha y \beta d(x) + ([d(r), x]_\gamma + [d(x), r]_\gamma)\alpha y \beta x + ([r, d(x)]_\gamma + [x, d(r)]_\gamma)\alpha y \beta x = [r, x]_\gamma \alpha y \beta d(x)$ for all $x, y.r \in R_\Gamma, \alpha, \beta, \gamma \in \Gamma$. Then by primeness of R_Γ, either $[r, x]_\gamma = 0$ for all $x, r \in R_\Gamma, \gamma \in \Gamma$ or $d(x) = 0$ for all $x \in R_\Gamma$. But as d is non-zero so we have $[r, x]_\gamma = 0$ for all $x, r \in R_\Gamma, \gamma \in \Gamma$. Thus R_Γ is commutative. ■

The next result is a generalization of Posner's second theorem for additively regular Γ-semiring R_Γ.

Theorem 4.22. *Let R_Γ be a prime additively regular Γ-semiring. If there is a non-zero centralizing derivation of R_Γ, then R_Γ is commutative.*

Proof. Let R_Γ be a prime additively regular Γ-semiring and d be a non-zero centralizing derivation of R_Γ. Then by using Remark 4.19, we have $[d(x), x]_\gamma = 0$ for all $x \in R_\Gamma, \gamma \in \Gamma$. Thus from Theorem 4.21, R_Γ is commutative. ■

ABOUT THE JOURNAL

GIS SCIENCE JOURNAL is A SCOPUS DATA BASE ACTIVE JOURNAL AND AN UGC CARE GROUP II JOURNAL

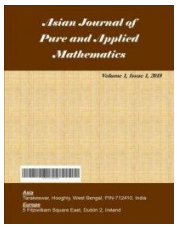
GIS SCIENCE JOURNAL is an open access scholastic and peer reviewed monthly international journal for encouraging Researchers, Practitioners, Academicians from Life Sciences, Engineering and Technology Management sectors to contribute to their inventive Research achievements and original work to make superiority information presented for a broader civic of readers and Internet users. Journal of Xidian University targets at promoting the integration of academic theories.

GIS SCIENCE JOURNAL publishing full-length research papers and review articles covering subjects that fall under the wide spectrum of science Engineering & technology. The journal is dedicated towards dissemination of knowledge related to the advancement in scientific research.

PEER REVIEW

Manuscripts submitted to the Science, Technology and Development Journal are approved by the Editor-in-chief followed by formal peer review process conducted in collaboration with editorial board members and independent referees. The publisher encourages the authors and reviewers

to use the electronic submission and peer-review system.Manuscripts submitted to the Science, Technology and Development Journal are approved by the Editor-in-chief followed by formal peer review process conducted in collaboration with editorial board members and independent referees. The publisher encourages the authors and reviewers to use the electronic submission and peer-review system.



INDEXED IN

GIS SCIENCE JOURNAL is part of University Grants Commission (UGC) Consortium for Research and Academic Ethics (CARE) in Group 2. You may find GIS SCIENCE by Searching UGC Care List Group 2 – Scopus Active Journal – 2 Science Citation Index Expanded page by searching through Try the MJL Beta option. To match global standards of high quality research, in all academic disciplines under its purview, the UGC, aspires to stimulate and empower the Indian academia through its “Quality Mandate”.

DOI is a persistent identifier or handle used to uniquely identify objects, standardized by the International Organization for Standardization. An implementation of the Handle System, DOIs are in wide use mainly to identify professional and government information, such as research reports and data sets, and official publications though they also have been used to identify other types of information resources, such as commercial videos.

Crossref is a not-for-profit association of about 2000 voting member publishers who represent 4300 societies and publishers, including both commercial and not-for-profit organizations. Crossref includes publishers with varied business models, including those with both open access and subscription policies. Crossref does not provide a database of full text scientific content. Rather, it facilitates the links between distributed content hosted at other sites.

Original Research Article

Abstract

The double-diffusive instability of a plasma is considered in the presence of finite Larmor radius effect and porous medium. Following linear stability theory and normal mode analysis method, the dispersion relation is obtained. It is found that the finite Larmor radius, stable solute gradient and magnetic field introduce oscillatory modes in the systems which were non-existent in their absence. For stationary convection case, the finite Larmor radius and stable solute gradient have stabilizing effects on the system. On the other hand, the medium permeability has a destabilizing (or stabilizing) effect and the magnetic field has a stabilizing (or destabilizing) effect under certain condition in the presence of finite Larmor radius effect whereas in the absence of finite Larmor radius effect, the medium permeability and the magnetic field have destabilizing and stabilizing effects, respectively. The sufficient conditions for non-existence of overstability are also obtained.

Keywords: Double-diffusive instability; plasma; finite Larmor radius effect; porous medium.

1 Introduction

The study of onset of convection in a porous medium has attracted considerable interest because of its natural occurrence and of its intrinsic importance in many industrial problems, particularly in petroleum-exploration, chemical and nuclear industries. The derivation of the basic equations of a layer of fluid heated from below in porous medium, using Boussinesq approximation, has been given by Joseph [1]. The study of a layer of fluid heated from below in porous media is motivated both theoretically and by its practical applications in engineering disciplines. Among the applications in engineering disciplines one can find the food process industry, chemical process industry, solidification and centrifugal casting of metals. The development of geothermal power resources has increased general interest in the properties of convection in porous medium. Lapwood [2] has studied the stability of convective flow in a porous medium using Rayleigh's procedure. The Rayleigh instability of a thermal boundary layer in flow through a porous medium has been considered by Wooding [3].

**Corresponding author: E-mail: pkdureja@gmail.com;*

A detailed account of the theoretical and experimental results of the onset of thermal instability (Bénard convection) in a fluid layer under varying assumptions of hydrodynamics and hydromagnetics has been given in the celebrated monograph by Chandrasekhar [4]. Veronis [5] has investigated the problem of thermohaline convection in a layer of fluid heated from below and subjected to a stable salinity gradient. The buoyancy forces can arise not only from density differences due to variations in temperature but also from those due to variations in solute concentration. Thermosolutal convection problems arise in oceanography, limnology and engineering. The investigation of thermosolutal convection is motivated by its interesting complexities as a double diffusion phenomena as well as its direct relevance to geophysics and astrophysics. Stomell et al. [6] did the pioneering work regarding the investigation of thermosolutal convection. This work was elaborated in different physical situations by Stern [7] and Nield [8]. Examples of particular interest are provided by ponds built to trap solar heat (Tabor and Matz [9]) and some Antarctic lakes (Shirtcliffe [10]). The physics is quite similar in the stellar case in that Helium acts like salt in raising the density and in diffusing more slowly than heat. The conditions under which convective motion in thermosolutal convection are important (e.g. in lower parts of the Earth's atmosphere, astrophysics and several geophysical situation) are usually far removed from the consideration of a single component fluid and rigid boundaries and therefore it is desirable to consider a fluid acted on by a solute gradient and free boundaries. A double-diffusive instability that occurs when a solution of a slowly diffusing protein is layered over a denser solution of more rapidly diffusing sucrose has been explained by Brakke [11]. Nason et al. [12] found that this instability, which is deleterious to certain biochemical separations, can be suppressed by rotation in the ultra centrifuge.

The properties of ionized space and laboratory magnetic fluids (plasmas) have been intensively investigated theoretically and experimentally in the past sixty years. One of the key aspects studied in this context is the stability of plasma structures. Usually, instabilities can be divided into two categories: macro- and micro-instabilities. Macro-instabilities occur with low frequencies compared to the plasma and cyclotron frequency and they are studied within the framework of magnetohydrodynamics (MHD). Physicists have understood the behavior of macro-instabilities and they showed how to avoid the most destructive of them, but small-scale gradient driven micro-instabilities are still a serious obstacle for having a stable plasma for a large range of parameters. Micro-instabilities are described by models which include, e.g. finite Larmor radius (FLR) and collisionless dissipative effects in plasmas. Time and length scales of micro-instabilities are comparable to the turbulent length scales and the length scales of transport coefficients. In general, the FLR effect is neglected. However, when the Larmor radius becomes comparable to the hydromagnetic length of the problem (e.g. wavelength) or the gyration frequency of ions in the magnetic field is of the same order as the wave frequency, finiteness of the Larmor radius must be taken into account. Strictly speaking, the space and time scale for the breakdown of hydromagnetics are on the respective scales of ion gyration about the field, and the ion Larmor frequency. In the present paper, we explore the effect of FLR on the double diffusive instability of a plasma. Finite Larmor radius effect on plasma instabilities has been the subject of many investigations. In many astrophysical plasma situations such as in solar corona, interstellar and interplanetary plasmas the assumption of zero Larmor radius is not valid. Roberts and Taylor [13] and Rosenbluth et al. [14] have shown the stabilizing influence of finite ion Larmor radius (FLR) effects on plasma instabilities. Hernegger [15] investigated the stabilizing effect of FLR on thermal instability and showed that thermal criterion is changed by FLR for wave propagation perpendicular to the magnetic field. Sharma [16] investigated the stabilizing effect of FLR on thermal instability of rotating plasma. Ariel [17] discussed the stabilizing effect of FLR on thermal instability of conducting plasma layer of finite thickness surrounded by a non-conducting matter. Vaghela and Chhajlani [18] studied the stabilizing effect of FLR on magneto-thermal stability of resistive plasma through a porous medium with thermal conduction. Bhatia and Chhonkar [19] investigated the stabilizing effect of FLR on the instability of a rotating layer of self-gravitating plasma incorporating the effects of viscosity and Hall current. Vyas and Chhajlani [20] pointed out the stabilizing effect of FLR on the thermal instability of magnetized rotating plasma incorporating the effects of viscosity, finite electrical conductivity, porosity and thermal conductivity. Marcu and Ballai [21] showed the stabilizing effect of FLR on thermosolutal stability of two-component rotating plasma. Kaothekar and Chhajlani [22] investigated the problem of Jeans instability of self-gravitating rotating radiative plasma with finite Larmor radius corrections. Thus FLR effect is an important factor in the discussion of thermosolutal instability and other hydromagnetic instabilities. Kaothekar [23] has

studied the effect of Hall current and finite Larmor radius corrections on thermal instability of radiative plasma for star formation in interstellar medium. The impact of porosity on the Jeans instability in a viscous quantum magneto plasma has been investigated by Sutar [24]. In another study, Kaothekar [25] has discussed the thermal instability of partially ionized viscous plasma with Hall effect and FLR corrections flowing through a porous medium. Keeping these in mind, an attempt is made to study the thermosolutal instability of a plasma in porous medium in the presence of finite Larmor radius effects in the present paper.

2 Formulation of the Problem and Perturbation Equations

Consider an infinite, horizontal, incompressible, viscous and finitely (electrically) conducting plasma layer of depth d, heated and soluted from below so that the temperatures, densities and solute concentrations at the bottom surface $z = 0$ are T_0, ρ_0 and C_0 and at the upper surface $z = d$ are T_d, ρ_d and C_d, respectively, and that a uniform temperature gradient $\beta(= \left|{}^{dT}/_{dz}\right|)$ and uniform solute gradient $\beta'(= \left|{}^{dC}/_{dz}\right|)$ are maintained. The gravity field $\vec{g}(0, 0, -g)$ and uniform vertical magnetic field $\vec{H}(0, 0, H)$ pervade the system. This plasma layer is assumed to be flowing through an isotropic and homogeneous porous medium of porosity ε and medium permeability k_1.

Let $p, \rho, T, C, \alpha, \alpha', \chi, \chi', g, \mu_e, \mu, \nu\left(=\frac{\mu}{\rho_0}\right), \vec{v}\,(u, v, w), \eta$ and $\overleftrightarrow{P}$ denote, respectively, the pressure, density, temperature, solute concentration, thermal coefficient of expansion, an analogous solute coefficient of expansion, thermal diffusity, solute diffusity, gravitational acceleration, magnetic permeability, viscosity, kinematic viscosity, velocity, resistivity and stress tensor taking into account the finite Larmor radius effect. Then the equations expressing the conservation of momentum, mass, heat, solute mass concentration and equation of state are

$$\frac{1}{\varepsilon}\left[\frac{\partial \vec{V}}{\partial t} + \frac{1}{\varepsilon}(\vec{V}.\nabla)\vec{V}\right] = -\frac{1}{\rho_0}\nabla p + \vec{g}\left(1 + \frac{\delta\rho}{\rho_0}\right) + \frac{\mu_e}{4\pi\rho_0}(\nabla \times \vec{H}) \times \vec{H} - \frac{\nu}{k_1}\vec{V} - \frac{1}{\rho_0}\overleftrightarrow{P}, \tag{1}$$

$$\nabla.\vec{V} = 0, \tag{2}$$

$$E\frac{\partial T}{\partial t} + (\vec{V}.\nabla)T = \kappa\nabla^2 T, \tag{3}$$

$$E^{\frac{\partial C}{\partial t}} + (\vec{V}.\nabla) = \kappa^{\nabla^2} C, \tag{4}$$

$$\rho = \rho_0[1 - \alpha(T - T_0) + \alpha'(C - C_0)]. \tag{5}$$

Here use has been made of the Boussinesq approximation in writing equation (1). Now the Maxwell's equations yield

$$\varepsilon\frac{d\vec{H}}{dt} = (\vec{H}.\nabla)\vec{V} + \epsilon\eta\nabla^2\vec{H}, \tag{6}$$

$$\nabla.\vec{H} = 0, \tag{7}$$

Where $d/dt = \partial/\partial t + (1/\varepsilon)\vec{V}.\nabla$ stands for the convective derivative, $E = \varepsilon + (1 - \varepsilon)\,\rho_s C_s/\rho_0 C$ and E' is an analogous solute coefficient. ρ_s, C_s and ρ_0, C stand for density and specific heat of solid (porous matrix) and fluid, respectively.

For the magnetic field along the z −axis, the stress tensor $\vec{\vec{P}}$, taking into account the finite ion gyration radius (Vandakurov [26]), has the components

$$P_{xx} = -\rho_0 \nu_0 \left(\frac{\partial u}{\partial y} + \frac{\partial v}{\partial x}\right),$$
$$P_{xy} = P_{yz} = \rho_0 \nu_0 \left(\frac{\partial u}{\partial x} - \frac{\partial v}{\partial y}\right),$$
$$P_{xz} = P_{zx} = -2\rho_0 \nu_0 \left(\frac{\partial v}{\partial z} + \frac{\partial w}{\partial y}\right), \tag{8}$$

$$P_{yy} = \rho_0 \nu_0 \left(\frac{\partial u}{\partial y} + \frac{\partial v}{\partial z}\right),$$
$$P_{yz} = P_{xy} = 2\rho_0 \nu_0 \left(\frac{\partial w}{\partial x} + \frac{\partial u}{\partial z}\right), \qquad P_{zz} = 0,$$

where $\rho_0 \nu_0 = NT/4\omega_H$, ω_H being the ion-gyration frequency, while N and T are number density and temperature of the ions, respectively.

The steady state solution is

$$\vec{V} = 0, \qquad T = T_0 - \beta z, \qquad C = C_0 - \beta' z, \qquad \rho = \rho_0(1 + \alpha\beta z - \alpha'\beta' z). \tag{9}$$

Now we consider a small perturbation on the steady state and let $\delta p, \delta\rho, \theta, \gamma, \vec{h}(h_x, h_y, h_z)$ and $\vec{V}(u, v, w)$ denote, respectively, the perturbations in pressure p, density ρ, temperature T, solute concentration C, magnetic field $\vec{H}$, and velocity. The change in density $\delta\rho$, caused by the perturbations θ and γ in temperature and concentration, is given by

$$\delta\rho = -\rho_0(\alpha\theta - \alpha'\gamma). \tag{10}$$

Then the linearized hydromagnetic perturbation equations become

$$\frac{1}{\varepsilon}\frac{\partial \vec{V}}{\partial t} = -\frac{1}{\rho_0}\nabla\delta p + \vec{g}\left(\frac{\delta\rho}{\rho_0}\right) + \frac{\mu_e}{4\pi\rho_0}(\nabla \times \vec{h}) \times \vec{H} - \frac{\nu}{k_1}\vec{V} - \frac{1}{\rho_0}\nabla\vec{\vec{P}}, \tag{11}$$

$$\nabla.\vec{V} = 0, \tag{12}$$

$$E\frac{\partial\theta}{\partial t} = \beta w + \kappa\nabla^2\theta, \tag{13}$$

$$E'\frac{\partial\gamma}{\partial t} = \beta' w + \kappa'\nabla^2\gamma, \tag{14}$$

$$\varepsilon\frac{\partial\vec{h}}{\partial t} = (\vec{H}.\nabla)\vec{V} + \epsilon\eta\nabla^2\vec{h}, \tag{15}$$

$$\nabla.\vec{h} = 0. \tag{16}$$

3 Dispersion Relation

For obtaining the dispersion relation, we now analyzing the disturbances into normal modes, assuming that the perturbation quantities are of the form

$$[w, \theta, \gamma, h_z, \zeta, \xi] = [W(z), \Theta(z), \Gamma(z), K(z), Z(z), X(z)] exp\left[ik_x x + ik_y y + nt\right], \quad (17)$$

where k_x and k_y are the wave numbers in the $x-$ and $y-$ directions, respectively, $k = \sqrt{k_x^2 + k_y^2}$ is the resultant wave number, and n is, in general, a complex constant. $\zeta = \partial v/\partial x - \partial u/\partial y$ and $\xi = \partial h_y/\partial x - \partial h_x/\partial y$ stand for the $z-$components of vorticity and current density, respectively.

Expressing the coordinates x, y, z in the new unit of length d and letting $a = kd, \sigma = nd^2/\nu, p_1 = \nu/\kappa, p_2 = \nu/\eta, q = \nu/\kappa', P_l = k_1/d^2,\ and\ D = d/dz$, equations (11) - (16), with the help of (10) and expression (17), in non-dimensional form, become

$$\left(\frac{\sigma}{\varepsilon} + \frac{1}{P_l}\right)(D^2 - a^2)W + \left(\frac{gd^2}{\nu}\right)a^2(\alpha\Theta - \alpha\Gamma) - \frac{\mu_e H d}{4\pi\rho_0\nu}(D^2 - a^2)DK + \left(\frac{\nu_0 d}{\nu}\right)(2D^2 + a^2)DZ = 0, \quad (18)$$

$$\left(\frac{\sigma}{\varepsilon} + \frac{1}{P_l}\right)Z = \left(\frac{\mu_e H d}{4\pi\rho_0\nu}\right)DX + \left(\frac{\nu_0}{\nu d}\right)(2D^2 + a^2)DW, \quad (19)$$

$$[D^2 - a^2 - Ep_1\sigma]\Theta = -\left(\frac{\beta d^2}{\kappa}\right)W, \quad (20)$$

$$[D^2 - a^2 - E'q\sigma]\Gamma = -\left(\frac{\beta' d^2}{\kappa'}\right)W, \quad (21)$$

$$[D^2 - a^2 - p_2\sigma]K = -\left(\frac{Hd}{\varepsilon\eta}\right)DW, \quad (22)$$

$$[D^2 - a^2 - p_2\sigma]X = -\left(\frac{Hd}{\varepsilon\eta}\right)DZ. \quad (23)$$

Consider the case where both boundaries are free as well as perfect conductors of both heat and solute, while the adjoining medium is electrically non-conducting. The boundary conditions for this case, using (17), are

$$W = D^2W = DZ = X = \Theta = \Gamma = 0\ and\ \vec{h}\ are\ continuous\ at\ z = 0\ and\ 1. \quad (24)$$

In the absence of any surface current, the tangential components of the magnetic field are continuous. Hence the boundary conditions, in addition to (24), are

$$DK = 0 \text{ on the boundaries.} \quad (25)$$

Using the above boundary conditions, it can be shown that all the even order derivatives of W must vanish for $z = 0\ and\ 1$ and hence the proper solution of W characterizing the lowest mode is

$$W = W_0 sin\ \pi z, \quad (26)$$

where W_0 is a constant.

Eliminating $Z, K, X, \Theta \; and \; \Gamma$ between equations (18)-(23) and substituting the proper solution (26) in the resultant equation, we obtain the dispersion relation

$$R_1 x = (1+x)\left(\frac{i\sigma_1}{\varepsilon}+\frac{1}{P}\right)(1+x+iEp_1\sigma_1) + S_1 x\frac{(1+x+iEp_1\sigma_1)}{(1+x+iE'q\sigma_1)} + Q_1\frac{(1+x)(1+x+iEp_1\sigma_1)}{\varepsilon(1+x+ip_2\sigma_1)} + \frac{U(2-x)^2(1+x+ip_2\sigma_1)(1+x+iEp_1\sigma_1)}{\left[(1+x+ip_2\sigma_1)\left(\frac{i\sigma_1}{\varepsilon}+\frac{1}{P}\right)+\frac{Q_1}{\varepsilon}\right]}, \tag{27}$$

Where

$$Q_1 = \frac{\mu_e H^2 d^2}{4\pi\rho_0 \nu\eta\pi^2}, \quad R_1 = \frac{g\alpha\beta d^4}{\nu\kappa\pi^4}, \quad S_1 = \frac{g\alpha'\beta' d^4}{\nu\kappa'\pi^4}, \quad U = \frac{\nu_0^2}{\nu^2}, \; P = \pi^2 P_l, i\sigma_1 = \frac{\sigma}{\pi^2}, x = \frac{a^2}{\pi^2}.$$

4 Important Theorems and Discussion

Theorem 1: The system is stable or unstable.

Proof: Multiplying equation (18) by W^*, the complex conjugate of W, and using equations (19) - (23) together with the boundary conditions (24) and (25), we obtain

$$\left(\frac{\sigma}{\varepsilon}+\frac{1}{P_l}\right)I_1 + \frac{g\alpha'\kappa' a^2}{\nu\beta'}(I_4 + E'q\sigma^* I_5) + \frac{\mu_e\nu\varepsilon}{4\pi\rho_0\nu}(I_6 + p_2\sigma^* I_7) + d^2\left(\frac{\sigma^*}{\varepsilon}+\frac{1}{P_l}\right)I_8 + \frac{\mu_e\eta d^2\varepsilon}{4\pi\rho_0\nu}(I_9 + p_2\sigma I_{10}) - \frac{g\alpha\kappa a^2}{\nu\beta}(I_2 + Ep_1\sigma^* I_3) = 0, \tag{28}$$

Where

$$I_1 = \int_0^1 (|DW|^2 + a^2|W|^2)\,dz, \; I_2 = \int_0^1 (|D\Theta|^2 + a^2|\Theta|^2)dz, \; I_3 = \int_0^1 (|\Theta|^2)dz,$$
$$I_4 = \int_0^1 (|D\Gamma|^2 + a^2|\Gamma|^2)dz, I_5 = \int_0^1 (|\Gamma|^2)dz, \; I_6 = \int_0^1 (|D^2K|^2 + 2a^2|DK|^2 + a^4|K|^2)dz,$$
$$I_7 = \int_0^1 (|DK|^2 + a^2|K|^2)dz, \; I_8 = \int_0^1 (|Z|^2)dz, \; I_9 = \int_0^1 (|DX|^2 + a^2|X|^2)dz,$$
$$I_{10} = \int_0^1 (|X|^2)dz. \tag{29}$$

and σ^* is the complex conjugate of σ. The integrals $I_1, \ldots\ldots\ldots\ldots I_{10}$ are all positive definite. Putting $\sigma = \sigma_r + i\sigma_i$ and equating the real and imaginary parts of equation (28), we obtain

$$\left[\frac{I_1}{\varepsilon} + \frac{g\alpha'\kappa' a^2}{\nu\beta'}E'qI_5 + \frac{\mu_e\eta\varepsilon}{4\pi\rho_0\nu}p_2 I_7 + \frac{d^2}{\varepsilon}I_8 + \frac{\mu_e\eta d^2\varepsilon}{4\pi\rho_0\nu}p_2 I_{10} - \frac{g\alpha\kappa a^2}{\nu\beta}Ep_1 I_3\right]\sigma_r =$$
$$-\left[\frac{1}{P_l}I_1 + \frac{g\alpha'\kappa' a^2}{\nu\beta'}I_4 + \frac{\mu_e\eta\varepsilon}{4\pi\rho_0\nu}I_6 + d^2\left(\frac{1}{P_l}\right)I_8 + \frac{\mu_e\eta d^2\varepsilon}{4\pi\rho_0\nu}I_9 - \frac{g\alpha\kappa a^2}{\nu\beta}I_2\right], \tag{30}$$

and

$$\left[\frac{I_1}{\varepsilon} - \frac{g\alpha'\kappa' a^2}{\nu\beta'}E'qI_5 - \frac{\mu_e\eta\varepsilon}{4\pi\rho_0\nu}p_2 I_7 - \frac{d^2}{\varepsilon}I_8 + \frac{\mu_e\eta d^2\varepsilon}{4\pi\rho_0\nu}p_2 I_{10} + \frac{g\alpha\kappa a^2}{\nu\beta}Ep_1 I_3\right]\sigma_i = 0. \tag{31}$$

It is evident from equation (30) that σ_r is positive or negative. The system is, therefore, stable or unstable.

Theorem 2: The modes may be oscillatory or non-oscillatory in contrast to case of no magnetic field, and in the absence of finite Larmor radius and stable solute gradient where modes are non-oscillatory.

Proof: Equation (31) yields that σ_i may be zero or non-zero, which means that the modes may be non-oscillatory or oscillatory. In the absence of finite Larmor radius, stable solute gradient and magnetic field, equation (31) reduces to

$$\sigma_i \left[\frac{I_1}{\varepsilon} + \frac{g\alpha\kappa a^2}{\nu\beta} E p_1 I_3\right] = 0$$

and the terms in brackets are positive definite. Thus$\sigma_i = 0$, which means that oscillatory modes are not allowed and the principle of exchange of stabilities is valid. The oscillatory modes are introduced due to the presence of magnetic field, finite Larmor radius and stable solute gradient which were non-existent in their absence.

Theorem 3: The system is stable for $\frac{g\alpha\kappa}{\nu\beta} \leq \frac{27\pi^4}{4}$ and under the condition $\frac{g\alpha\kappa}{\nu\beta} > \frac{27\pi^4}{4}$, the system becomes unstable.

Proof: From equation (31), it is clear that σ_i is zero when the quantity multiplying it is not zero and arbitrary when this quantity is zero.

If $\sigma_i \neq 0$, then equation (31) gives

$$\frac{I_1}{\varepsilon} + \frac{\mu_e \eta d^2 \varepsilon}{4\pi\rho_0 \nu} p_2 I_{10} = \frac{g\alpha'\kappa' a^2}{\nu\beta'} E' q I_5 + \frac{\mu_e \eta \varepsilon}{4\pi\rho_0} p_2 I_7 + \frac{d^2}{\varepsilon} I_8 - \frac{g\alpha\kappa a^2}{\nu\beta} E p_1 I_3$$

Substituting this in equation (30), we get

$$\frac{2\sigma_r I_1}{\varepsilon} + \frac{1}{P_l} I_1 + \frac{g\alpha'\kappa' a^2}{\nu\beta'} I_4 + \frac{\mu_e \eta \varepsilon}{4\pi\rho_0 \nu} I_6 + d^2 \left(\frac{1}{P_l}\right) I_8 + \frac{\mu_e \eta d^2 \varepsilon}{4\pi\rho_0 \nu} I_9 + \frac{2\sigma_r \mu_e \eta d^2 \varepsilon}{4\pi\rho_0 \nu} p_2 I_{10} = \frac{g\alpha\kappa a^2}{\nu\beta} I_2 \,. \tag{32}$$

Equation (32) on using Rayleigh-Ritz inequality gives

$$\frac{(\pi^2 + a^2)^3}{a^2} \int_0^1 |W|^2 \, dz + \frac{(\pi^2 + a^2)}{a^2} \left\{ \frac{2\sigma_r \mu_e \eta d^2 \varepsilon}{4\pi\rho_0 \nu} p_2 I_{10} + \frac{\mu_e \eta d^2 \varepsilon}{4\pi\rho_0 \nu} I_9 + d^2 \left(\frac{1}{P_l}\right) I_8 + \frac{\mu_e \eta \varepsilon}{4\pi\rho_0 \nu} I_6 + \frac{g\alpha'\kappa' a^2}{\nu\beta'} I_4 + \frac{1}{P_l'} I_1 + \frac{2\sigma_r}{\varepsilon} I_1 \right\} \leq \frac{g\alpha\kappa}{\beta\nu} \int_0^1 |W|^2 \, dz \;. \tag{33}$$

Therefore, it follows from equation (33) that

$$\left[\frac{27\pi^4}{4} - \frac{g\alpha\kappa}{\nu\beta}\right] \int_0^1 |W|^2 \, dz + \frac{(\pi^2 + a^2)}{a^2} \left\{ \frac{2\sigma_r \mu_e \eta d^2 \varepsilon}{4\pi\rho_0 \nu} p_2 I_{10} + \frac{\mu_e \eta d^2 \varepsilon}{4\pi\rho_0 \nu} I_9 + d^2 \left(\frac{1}{P_l}\right) I_8 + \frac{\mu_e \eta \varepsilon}{4\pi\rho_0 \nu} I_6 + \frac{g\alpha'\kappa' a^2}{\nu\beta'} I_4 + \frac{1}{P_l'} I_1 + \frac{2\sigma_r}{\varepsilon} I_1 \right\} \leq 0 \tag{34}$$

since minimum value of $\frac{(\pi^2+a^2)^3}{a^2}$ with respect to a^2 is $\frac{27\pi^4}{4}$.

Now, let $\sigma_r \geq 0$, we necessary have from (34) that

$$\frac{g\alpha\kappa}{\nu\beta} > \frac{27\pi^4}{4} \quad . \tag{35}$$

Hence, if

$$\frac{g\alpha\kappa}{\nu\beta} \leq \frac{27\pi^4}{4} \quad , \tag{36}$$

then $\sigma_r < 0$. Therefore, the system is stable. Thus, under condition (36), the system is stable and under condition (35) the system becomes unstable.

Theorem 4: For stationary convection case:

(I) Finite Larmor radius and stable solute gradient have stabilizing effects on the system.
(II) In the absence of finite Larmor radius effect, the medium permeability and the magnetic field have destabilizing and stabilizing effects respectively.
(III) In the presence of finite Larmor radius effect if

$$\left[\frac{1+x}{P} + \frac{Q_1}{\varepsilon}\right]^2 > (or\ <)\ U(2-x)^2(1+x)$$

the medium permeability has a destabilizing (or stabilizing) and the magnetic field has a stabilizing (or destabilizing) effect on the system.

Proof: When the instability sets in as stationary convection, the marginal state will be characterized by $\sigma = 0$. Putting$\sigma = 0$, the dispersion relation (27) reduces to

$$R_1 = \left(\frac{1+x}{x}\right)\left[\frac{1+x}{P} + \frac{Q_1}{\varepsilon}\right] + \frac{U(2-x)^2(1+x)^2}{x\left[\frac{1+x}{P} + \frac{Q_1}{\varepsilon}\right]} + S_1 \,, \tag{37}$$

which expresses the modified Rayleigh number R_1 as a function of the dimensionless wave number x and the parameters $S_1\,, Q_1, U\ and\ P$. To investigate the effects of stable solute gradient, finite Larmor radius, medium permeability and magnetic field, we examine the behaviour of $dR_1/dS_1\,, dR_1/dU\ , dR_1/dP\ and\ dR_1/dQ_1$ analytically.

(I) Equation (37) yields

$$\frac{dR_1}{dS_1} = +1\,, \tag{38}$$

which is positive. Thus, the stable solute gradient has a stabilizing effect on the system for the case of stationary convection.

Equation (37) also yields

$$\frac{dR_1}{dU} = \frac{(2-x)^2(1+x)^2}{x\left[\frac{1+x}{P} + \frac{Q_1}{\varepsilon}\right]}\,, \tag{39}$$

which is always positive. The finite Larmor radius, therefore, has a stabilizing effect on the system for the case of stationary convection.

(II) It is evident from equation (37) that

$$\frac{dR_1}{dP} = -\frac{(1+x)}{xP^2}\left[\frac{\left(\frac{1+x}{P}+\frac{Q_1}{\varepsilon}\right)^2 - U(2-x)^2(1+x)}{\left(\frac{1+x}{P}+\frac{Q_1}{\varepsilon}\right)^2}\right], \tag{40}$$

and

$$\frac{dR_1}{dQ_1} = \left(\frac{1+x}{\varepsilon x}\right)\left[\frac{\left(\frac{1+x}{P}+\frac{Q_1}{\varepsilon}\right)^2 - U(2-x)^2(1+x)}{\left(\frac{1+x}{P}+\frac{Q_1}{\varepsilon}\right)^2}\right], \tag{41}$$

In the absence of finite Larmor radius effect, equation (40) reduces to

$$\frac{dR_1}{dP} = -\frac{(1+x)}{xP^2}, \tag{42}$$

which is negative. Hence, the medium permeability has a destabilizing effect on the system in the absence of finite Larmor radius effect.

Now, in the absence of finite Larmor radius effect, equation (41) gives

$$\frac{dR_1}{dQ_1} = \left(\frac{1+x}{x}\right), \tag{43}$$

which is positive. The magnetic field, therefore, has a stabilizing effect on the system for the case of stationary convection in the absence of finite Larmor radius effect.

(III) In the presence of finite Larmor radius effect, it is clear from equations (40) and (41) that the medium permeability has a destabilizing (or stabilizing) and the magnetic field has a stabilizing (or destabilizing) effect on the system for the case of stationary convection if

$$\left[\frac{1+x}{P}+\frac{Q_1}{\varepsilon}\right]^2 > (or\ <)\ U(2-x)^2(1+x)\,. \tag{44}$$

Theorem 5: The sufficient conditions for the non-existence of overstability are

$$\kappa < \eta E, E'\kappa < E\kappa' and\ k < (\pi/d)\sqrt{Evd\varepsilon/(\pi^2 k_1\kappa) - 1}$$

Proof: Here we discuss the possibility of whether instability may occur as overstability. Since we wish to determine the critical Rayleigh number for the onset of instability via a state of pure oscillations, it suffices to find conditions for which (27) will admit of solutions with σ_1 real.

Equating the real and imaginary parts of equation (27) and eliminating R_1 between them, we obtain

$$A_5C_1^5 + A_4C_1^4 + A_3C_1^3 + A_2C_1^2 + A_1C_1 + A_0 = 0\,, \tag{45}$$

where $C_1 = \sigma_1^2$, $b = 1 + x\ and$

$$A_5 = bP^4E'^2q^2\left[b + \frac{Ep_1}{P}\right], \tag{46}$$

$$A_0 = P^4\left[\frac{1}{P^2}\right]b^8 + P^4\left[\frac{2Q_1}{P} + \frac{Ep_1}{P^2}\right]b^7$$
$$+ P^4\left[\frac{Q_1}{P^2}(Ep_1 - p_2) + Q_1^2 + \frac{2Ep_1Q_1}{P^2} + U(3-b)^2\left(\frac{Ep_1}{P} - b\right) + \frac{\varepsilon S_1}{P^2}(Ep_1 - E'q)\right]b^6 +$$
$$+P^4\left[\frac{2Q_1^2}{P}(Ep_1 - p_2) + Q_1U(3-b)^2(Ep_1 + p_2) + \frac{Q_1^2}{P}Ep_1\right]b^5$$
$$+P^4\left[Q_1^3(Ep_1 - p_2) + \frac{2\varepsilon S_1(b-1)Q_1}{P}(Ep_1 - E'q)\right]b^4 + P^4[\varepsilon S_1(b-1)Q_1^2(Ep_1 - E'q)]b^3. \quad (47)$$

The coefficients $A_1 - A_4$ being quite lengthy and not needed in the discussion of overstability, have not been written here. Since σ_1 is real for overstability, the five values of C_1 are positive. The product of the roots of (38) is $-A_0/A_5$ and if this is to be positive, then $A_0 < 0$ (since from (46), $A_5 > 0$).

It is clear from (47) that A_0 is always positive if

$$Ep_1 > p_2\,, \qquad Ep_1 > E'q, \qquad \frac{Ep_1}{P} > b\,, \quad (48)$$

which implies that

$$\kappa < \eta E\,, \qquad E'\kappa < E\kappa', \quad k < \frac{\pi}{d}\sqrt{\frac{Ev d\varepsilon}{\pi^2 k_1 \kappa} - 1}\,. \quad (49)$$

Thus $\kappa < \eta E, E'\kappa < E\kappa' and\ k < (\pi/d)\sqrt{Ev d\varepsilon/(\pi^2 k_1\kappa) - 1}$ are the sufficient conditions for the non-existence of overstability, the violation of which does not necessarily imply the occurrence of overstability.

5 Conclusions

The double-diffusive instability of a plasma in porous medium in the presence of finite Larmor radius effect is considered in the present paper. The investigation is motivated by its interesting complexities as a double diffusion phenomena as well as its direct relevance to astrophysics and geophysics. The main conclusions from the analysis of this paper are as follows:

- It is found that the finite Larmor radius, stable solute gradient and magnetic field introduce oscillatory modes in the system which was non-existent in their absence.
- It is observed that the system is stable for $\frac{g\alpha\kappa}{\nu\beta} \leq \frac{27\pi^4}{4}$ and under the condition $\frac{g\alpha\kappa}{\nu\beta} > \frac{27\pi^4}{4}$, the system becomes unstable.
- For the case of stationary convection, the stable solute gradient and finite Larmor radius are found to have stabilizing effects on the system.
- It is also observed for the case of stationary convection that in the presence of finite Larmor radius effect, the magnetic field has a stabilizing (or destabilizing) effect and the medium permeability has a destabilizing (or stabilizing) effect under certain conditions whereas in the absence of finite Larmor radius effect, the magnetic field and the medium permeability have stabilizing and destabilizing effects, respectively.
- The case of overstability is also considered. The conditions

  $\kappa < \eta E, E'\kappa < E\kappa' and\ k < (\pi/d)\sqrt{Ev d\varepsilon/(\pi^2 k_1\kappa) - 1}$

  are the sufficient conditions for the non-existence of overstability, the violation of which does not necessarily imply the occurrence of overstability.

Isolation and Idenficatiion of Vibrio Spp from Different Dye Industry Effluent in Salem Distric Tamilnadu

Authors : Dr. V. Kalaiselvi ; P. Umamagesh ; D. Ammu ; R. Latha

DOI : doi.org/10.47752/sjsr.310.129.132 (https://doi.org/10.47752/sjsr.310.129.132)

Abstract:

Studies were carried out on the Different type of vibrio spp, isolated from dye industry effluent. Among the 90 strains of vibrio spp isolated from effluents of textile industries, three showed optimize at different factors such as pH, Temperatue, salinity, carbone source, nitrogen source etc.

Effective Interfacial Tension Effect on Kelvin-Helmholtz Instability

Authors : Pardeep Kumar ; Hari Mohan

DOI : doi.org/10.47752/sjsr.310.122.128 (https://doi.org/10.47752/sjsr.310.122.128)

Abstract:

The instability of the plane interface between two uniform, superposed and streaming Walters' B' viscoelastic fluids through porous medium in the presence of effective interfacial tension is considered. The case of two uniform streaming fluids separated by a horizontal boundary is studied. It is observed, for the special case where the effective interfacial tension is ignored, that the system is stable or unstable for the potentially stable configuration which is in contrast to the case of Rivlin-Ericksen viscoelastic fluid or Newtonian fluid where the system is always stable for the potentially stable configuration. Moreover, if the perturbations in the direction of streaming are ignored, then the perturbations transverse to the direction of streaming are found to be unaffected by the presence of streaming, whereas for perturbations in all other directions there exists instability for a certain wave number range. 'Effective interfacial tension' is able to suppress this Kelvin-Helmholtz instability for small wavelength perturbations, the medium porosity reduces the stability range given in terms of a difference in streaming velocities.

ABOUT THE JOURNAL

GIS SCIENCE JOURNAL is A SCOPUS DATA BASE ACTIVE JOURNAL AND AN UGC CARE GROUP II JOURNAL

GIS SCIENCE JOURNAL is an open access scholastic and peer reviewed monthly international journal for encouraging Researchers, Practitioners, Academicians from Life Sciences, Engineering and Technology Management sectors to contribute to their inventive Research achievements and original work to make superiority information presented for a broader civic of readers and Internet users. Journal of Xidian University targets at promoting the integration of academic theories.

GIS SCIENCE JOURNAL publishing full-length research papers and review articles covering subjects that fall under the wide spectrum of science Engineering & technology. The journal is dedicated towards dissemination of knowledge related to the advancement in scientific research.

PEER REVIEW

Manuscripts submitted to the Science, Technology and Development Journal are approved by the Editor-in-chief followed by formal peer review process conducted in collaboration with editorial board members and independent referees. The publisher encourages the authors and reviewers

to use the electronic submission and peer-review system.Manuscripts submitted to the Science, Technology and Development Journal are approved by the Editor-in-chief followed by formal peer review process conducted in collaboration with editorial board members and independent referees. The publisher encourages the authors and reviewers to use the electronic submission and peer-review system.

INDEXED IN

GIS SCIENCE JOURNAL is part of University Grants Commission (UGC) Consortium for Research and Academic Ethics (CARE) in Group 2. You may find GIS SCIENCE by Searching UGC Care List Group 2 – Scopus Active Journal – 2 Science Citation Index Expanded page by searching through Try the MJL Beta option. To match global standards of high quality research, in all academic disciplines under its purview, the UGC, aspires to stimulate and empower the Indian academia through its "Quality Mandate".

DOI is a persistent identifier or handle used to uniquely identify objects, standardized by the International Organization for Standardization. An implementation of the Handle System, DOIs are in wide use mainly to identify professional and government information, such as research reports and data sets, and official publications though they also have been used to identify other types of information resources, such as commercial videos.

Crossref is a not-for-profit association of about 2000 voting member publishers who represent 4300 societies and publishers, including both commercial and not-for-profit organizations. Crossref includes publishers with varied business models, including those with both open access and subscription policies. Crossref does not provide a database of full text scientific content. Rather, it facilitates the links between distributed content hosted at other sites.

Stability Analysis in Couple-Stress Rotatory Fluid

PARDEEP KUMAR

Department of Mathematics, ICDEOL, Himachal Pradesh University,
Summerhill, Shimla-5, INDIA

Abstract: The aim of the present research was to study the effect of uniform rotation on the layer of a couple-stress fluid heated from below in porous medium. Following the linearized stability theory, Boussinesq approximation and normal mode analysis, the dispersion relation is obtained. The stationary convection, stability of the system and oscillatory modes are discussed. For the case of stationary convection, it is found that rotation has a stabilizing effect, whereas the couple-stress parameter and medium permeability have both stabilizing and destabilizing effects on the system. It is found that the presence of rotation introduces oscillatory modes in the system which were non-existent in its absence. A sufficient condition for the non-existent of overstability is also obtained.

Key-Words: couple-stress fluid, heated from below, linearized stability theory, normal mode analysis method, porous medium, uniform rotation

Received: December 16, 2020. Revised: May 22, 2021. Accepted: June 9, 2021. Published: June 29, 2021.

1 Introduction

The thermal instability of a fluid layer heated from below plays an important role in geophysics, oceanography, atmospheric physics etc., and has been investigated by many authors, e.g. Be′nard [1], Rayleigh [2], Jeffreys [3]. A detailed account of the theoretical and experimental results of the onset of thermal instability (Be′nard convection) in a fluid layer under varying assumptions of hydrodynamics and hydromagnetics has been given in a treatise by Chandrasekhar [4] in his celebrated monograph. The use of the Boussinesq approximation has been made throughout, which states that the variations of density in the equations of motion can safely be ignored everywhere except in its association with the external force. The approximation is well justified in the case of incompressible fluids. Abdul-Bari and Al-Rubai [5] have studied the influence of Rayleigh-number in turbulent and laminar region in parallel-plate vertical channels. The influence of radiation on the unsteady free convection flow of a viscous incompressible fluid past a moving vertical plate with Newtonian heating has been investigated theoretically by Narahari and Ishak [6]. Vest and Arpaci [7] have studied the stability of a horizontal layer of Maxwell's viscoelastic fluid heated from below. The nature of instability and some factors may have different effects, on viscoelastic fluids as compared to the Newtonian fluids. For example, Bhatia and Steiner [8] have considered the effect of a uniform rotation on the thermal instability of a Maxwell fluid and have found that rotation has a destabilizing influence, in contrast to the stabilizing effect on a Newtonian fluid. Bhatia and Steiner [9] have also considered the thermal instability of a Maxwell fluid in hydromagnetics and have found that the magnetic field has stabilizing effect on viscoelastic fluid, just as in case of Newtonian fluid. Sharma [10] has studied the thermal instability of a layer of Oldroydian [11] fluid acted on by a uniform rotation and found that rotation has destabilizing and stabilizing effects under certain conditions, in contrast to a Maxwell fluid where the effect is destabilizing.

There are many fluids that cannot be characterized by Maxwell's or Oldroyd's constitutive relations. One type of such fluids are couple-stress fluids. The theory of couple-stress fluid has been formulated by Stokes [12]. One of the applications of couple-stress fluid is its use to the study of the mechanisms of lubrications of synovial joints, which has

become the object of scientific research. A human joint is a dynamically loaded bearing which has articular cartilage as the bearing and synovial fluid as the lubricant. When a fluid film is generated, squeeze-film action is capable of providing considerable protection to the cartilage surface. The shoulder, ankle, knee and hip joints are the loaded–bearing synovial joints of the human body and these joints have a low friction coefficient and negligible wear.

Normal synovial fluid is a viscous, non-Newtonian fluid and is generally clear or yellowish. According to the theory of Stokes [12], couple-stresses appear in noticeable magnitudes in fluids with very large molecules. Many of the flow problems in fluids with couple-stresses, discussed by Stokes, indicate some possible experiments, which could be used for determining the material constants, and the results are found to differ from those of Newtonian fluid. Couple-stresses are found to appear in noticeable magnitudes in polymer solutions for force and couple-stresses. This theory is developed in an effort to examine the simplest generalization of the classical theory, which would allow polar effects. The constitutive equations proposed by Stokes [12] are:

$$T_{(ij)} = (-p + \lambda D_{kk})\delta_{ij} + 2\mu D_{ij} \ ,$$

$$T_{[ij]} = -2\eta \overrightarrow{W}_{ij.kk} - \frac{\rho}{2}\vec{\varepsilon}_{ijs} G_s \ ,$$

and

$$M_{ij} = 4\eta \vec{\omega}_{j,i} + 4\eta' \vec{\omega}_{i,j} \ ,$$

where

$$D_{ij} = \frac{1}{2}\left(V_{i,j} + V_{j,i}\right), \overrightarrow{W}_{ij} = -\frac{1}{2}\left(V_{i,j} - V_{j,i}\right)$$

and $\vec{\omega}_i = \frac{1}{2}\vec{\varepsilon}_{ijk} V_{k,j}$.

Here T_{ij}, $T_{(ij)}$, $T_{[ij]}$, M_{ij}, D_{ij} , $\overrightarrow{W}_{i,j}$, $\vec{\omega}_i$, G_s, $\vec{\varepsilon}_{ijk}$, V, ρ and λ , μ , η , η' , are stress tensor, symmetric part of T_{ij}, anti-symmetric part of T_{ij}, the couple-stress tensor, deformation tensor, the vorticity tensor, the vorticity vector, body couple, the alternating unit tensor, velocity field, the density and material constants respectively. The dimensions of λ and μ are those of viscosity whereas the dimensions of η and η' are those of momentum.

Since the long chain hyaluronic acid molecules are found as additives in synovial fluids, Walicki and Walicka [13] modeled the synovial fluid as a couple-stress fluid. The synovial fluid is the natural lubricant of joints of the vertebrates. The detailed description of the joint lubrication has very important practical implications. Practically all diseases of joints are caused by or connected with a malfunction of the lubrication. The efficiency of the physiological joint lubrication is caused by several mechanisms. The synovial fluid is, due to its content of the hyaluronic acid, a fluid of high viscosity, near to a gel. Goel et al. [14] have studied the hydromagnetic stability of an unbounded couple-stress binary fluid mixture under rotation with vertical temperature and concentration gradients. Sharma et al. [15] have considered a couple-stress fluid with suspended particles heated from below. They have found that for stationary convection, couple-stress has a stabilizing effect whereas suspended particles have a destabilizing effect. Kumar et al. [16] have considered the thermal instability of a layer of a couple–stress fluid acted on by a uniform rotation, and have found that for stationary convection, the rotation has a stabilizing effect whereas couple-stress has both stabilizing and destabilizing effects. Thermosolutal convection in a couple-stress fluid in presence of magnetic field and rotation, separately, has been investigated by Kumar and Singh [17, 18]. Kumar and Kumar [19] have considered the problem of thermosolutal convection in compressible couple-stress fluid in presence of suspended particles. In another study, Kumar and Kumar [20] have considered the transport of vorticity in couple-stress fluid in the presence of suspended magnetic particles.

In recent years, the investigations of flow of fluids through porous media have become an important topic due to the recovery of crude oil from the pores of reservoir rocks. The study of the onset of convection in a porous medium has attracted considerable interest because of its natural occurrence and of its intrinsic importance in many industrial problems, particularly in petroleum exploration, chemical, and nuclear industries. The derivation of the basic equations of a layer of fluid heated from below in porous medium, using the Boussinesq approximation, has been given by Joseph [21]. The study of a layer of fluid heated from below

in porous media is motivated both theoretically and by its practical applications in engineering disciplines. Among the applications in engineering disciplines one can find the food process industry, chemical process industry, solidification and centrifugal casting of metals. The development of geothermal power resources has increased general interest in the properties of convection in porous medium. When a fluid permeates an isotropic and homogeneous porous medium, the gross effect is represented by Darcy's law. A great number of applications in geophysics may be found in the books by Phillips [22], Ingham and Pop [23], and Nield and Bejan [24]. Kumar and Kumar [25] have mathematically investigated the triply diffusive convection in couple-stress fluid in the presence of uniform vertical magnetic field through porous medium.

Keeping in mind the importance in geophysics, soil sciences, ground water hydrology, astrophysics, and various applications mentioned above, the present paper is devoted to the linear stability analysis of a layer of couple-stress fluid heated from below in the presence of uniform rotation through porous medium.

2 Formulation of the Problem and Dispersion Relation

The present problem is studied using methods of linearized stability theory and normal mode analysis. First of all linearized perturbation equations relevant to the problem are obtained and then dispersion relation obtained by using normal analysis method.

Consider an infinite horizontal incompressible layer of a couple-stress fluid of thickness d, heated from below so that the temperatures and densities at the bottom surface $z = 0$ are T_0, ρ_0 and at the upper surface $z = d$ are T_d, ρ_d, respectively, and that a uniform adverse temperature gradient $\beta(= |dT/dz|)$ is maintained. This layer is acted on by a uniform rotation $\vec{\Omega} = (0,0,\Omega)$ and the gravity field $\vec{g} = (0,0,-g)$ pervades the system. This fluid layer is flowing through an isotropic and homogeneous porous medium of porosity ε and the medium permeability k_1.

Let $\Gamma_{ij}, \tau_{ij}, e_{ij}, \delta_{ij}, \mu, \mu', v_i, and\ x_i$ denote the stress tensor, shear stress tensor, rate-of-strain tensor, Kronecker delta, viscosity, couple-stress viscosity, velocity vector and position vector, respectively. The constitutive relations for the couple-stress fluids are

$$\left.\begin{aligned} \Gamma_{ij} &= -p\delta_{ij} + \tau_{ij}\ , \\ \tau_{ij} &= 2(\mu - \mu'\nabla^2)e_{ij}\ , \\ e_{ij} &= \frac{1}{2}\left(\frac{\partial v_i}{\partial x_j} + \frac{\partial v_j}{\partial x_i}\right). \end{aligned}\right\} \tag{1}$$

Let $p,\ \rho,\ T\ and\ \vec{q}(u,v,w)$ denote the fluid pressure, density, temperature and filter velocity respectively. Then the momentum balance, mass balance and energy balance equations of the couple-stress fluid through porous medium (Stokes [12], Joseph [21]) in the presence of rotation are

$$\frac{1}{\varepsilon}\left[\frac{\partial \vec{q}}{\partial t} + \frac{1}{\varepsilon}(\vec{q}.\nabla)\vec{q}\right] = -\nabla\left(\frac{p}{\rho_0} - \frac{1}{2}\left|\vec{\Omega}\times\vec{r}\right|^2\right)$$

$$+\vec{g}\left(1 + \frac{\delta\rho}{\rho_0}\right) - \frac{1}{k_1}\left(\nu - \frac{\mu'}{\rho_0}\nabla^2\right)\vec{q} + \frac{2}{\varepsilon}\left(\vec{q}\times\vec{\Omega}\right) \tag{2}$$

$$\nabla.\vec{q} = 0, \tag{3}$$

$$E\frac{\partial T}{\partial t} + (\vec{q}.\nabla)T = \kappa\nabla^2 T. \tag{4}$$

The equation of state is

$$\rho = \rho_0[1 - \alpha(T - T_0)], \tag{5}$$

where the suffix zero refers to values at the reference level $z = 0$. In writing equation (2), use has been made of the Boussinesq approximation which states that the density variations are ignored in all terms in the equation of motion except the external force term. The kinematic viscosity ν, thermal diffusivity κ, couple-stress viscosity μ' and coefficient of thermal expansion α are all assumed to be constants. Here $E = \varepsilon + (1-\varepsilon)\rho_S c_S/(\rho_0 c_V)$, is constant where ρ_S, c_S and ρ_0, c_V stand for density and heat capacity of solid (porous matrix) material and fluid, respectively and $\vec{r} = (x,y,z)$.

The basic motionless solution is

$$\vec{q} = (0,0,0), T = T_0 - \beta z,$$
$$\rho = \rho_0(1 + \alpha\beta z). \quad (6)$$

Assume small perturbations around the basic solution and let $\vec{q}(u,v,w), \theta, \delta\rho \; and \; \delta p$ denote, respectively, the perturbations in fluid velocity $(0,0,0)$, temperature T, density ρ and pressure p. The change in density $\delta\rho$, caused mainly by the perturbation θ in temperature, is given by

$$\delta\rho = -\alpha\rho_0\theta. \quad (7)$$

Then the linearized perturbation equations are

$$\frac{1}{\varepsilon}\frac{\partial\vec{q}}{\partial t} = -\frac{1}{\rho_0}\nabla\delta p - \vec{g}\alpha\theta - \frac{1}{k_1}\left(\nu - \frac{\mu'}{\rho_0}\nabla^2\right)\vec{q} + \frac{2}{\varepsilon}(\vec{q}\times\vec{\Omega}), \quad (8)$$

$$\nabla.\vec{q} = 0, \quad (9)$$

$$E\frac{\partial\theta}{\partial t} = \beta w + \kappa\nabla^2\theta. \quad (10)$$

Writing the scalar components of equation (8) and eliminating $u, v, \delta p$ between them by using (9), we obtain

$$\frac{1}{\varepsilon}\frac{\partial}{\partial t}\nabla^2 w + \frac{1}{k_1}\left(\nu - \frac{\mu'}{\rho_0}\nabla^2\right)\nabla^2 w - g\alpha\left(\frac{\partial^2\theta}{\partial x^2} + \frac{\partial^2\theta}{\partial y^2}\right) + \frac{2\Omega}{\varepsilon}\frac{\partial\zeta}{\partial z} = 0, \quad (11)$$

$$\frac{1}{\varepsilon}\frac{\partial\zeta}{\partial t} + \frac{1}{k_1}\left(\nu - \frac{\mu'}{\rho_0}\nabla^2\right)\zeta = \frac{2\Omega}{\varepsilon}\frac{\partial w}{\partial z}, \quad (12)$$

where

$$\zeta\left(=\frac{\partial v}{\partial x} - \frac{\partial u}{\partial y}\right)$$

is the $z-$ component of vorticity.

We now analyze the disturbances into normal modes, assuming that the perturbation quantities are of the form

$$[w,\ \theta,\ \zeta] = [W(z), \Theta(z), Z(z)]exp(ik_x x + ik_y y + nt), \quad (13)$$

where k_x, k_y are wave numbers along the $x-$ direction and $y-$ direction, respectively, $k\left[=\left(k_x^2 + k_y^2\right)^{1/2}\right]$ is the resultant wave number and n is the growth rate which is, in general, a complex constant.

Using expression (13), equations (10) - (12) in non-dimensional form become

$$(D^2 - a^2)\left[\frac{\sigma}{\varepsilon} + \frac{1}{P_l} - \frac{F}{P_l}(D^2 - a^2)\right]W + \frac{g\alpha d^2}{\nu}a^2\Theta + \frac{2\Omega d^3}{\nu\varepsilon}DZ = 0, \quad (14)$$

$$\left[\frac{\sigma}{\varepsilon} + \frac{1}{P_l} - \frac{F}{P_l}(D^2 - a^2)\right]Z - \frac{2\Omega d}{\nu\varepsilon}DW = 0, \quad (15)$$

$$(D^2 - a^2 - Ep_1\sigma)\Theta = -\left(\frac{\beta d^2}{\kappa}\right)W, \quad (16)$$

where we have put $a = kd, \sigma = nd^2/\nu, x^* = x/d, y^* = y/d, z^* = z/d \; and \; D = d/dz$.

$p_1 = \nu/\kappa$ is the Prandtl number, $P_l = k_1/d^2$ is the dimensionless medium permeability and $F = \mu'/(\rho_0 d^2\nu)$ is the dimensionless couple-stress parameter. We shall suppress the stars $(*)$ for convenience hereafter.

Eliminating Z and Θ between equations (14) - (16), we obtain

$$(D^2 - a^2)(D^2 - a^2 - Ep_1)\left[\frac{\sigma}{\varepsilon} + \frac{1}{P_l} - \frac{F}{P_l}(D^2 - a^2)\right]^2 W + T_A(D^2 - a^2 - Ep_1\sigma)D^2 W = Ra^2\left[\frac{\sigma}{\varepsilon} + \frac{1}{P_l} - \frac{F}{P_l}(D^2 - a^2)\right]W, \quad (17)$$

where $R = g\alpha\beta d^4/(\nu\kappa)$ is the Rayleigh number and $T_A = \frac{4\Omega^2 d^4}{\nu^2\varepsilon^2}$ is the modified Taylor number.

We now assume that the fluid layer is confined between two free boundaries. The case of two free boundaries is of artificial nature, but due to mathematically simplicity it enables us to find analytical solutions and to make some qualitative conclusions. The appropriate

boundary conditions, with respect to which equations (14) – (16) must be solved, are

$$W = D^2W = 0, \Theta = 0, DZ = 0$$

$$for\ z = 0\ and\ z = 1. \qquad (18)$$

Using the boundary conditions (18), it can be shown that all the even order derivatives of W must vanish on the boundaries, and hence the proper solution of (17) characterizing the lowest mode is

$$W = W_0 \sin \pi z, \qquad (19)$$

where W_0 is a constant.

Substituting the proper solution (19) in equation (17), we obtain the dispersion relation

$$R_1 = \frac{(1 + x + iEp_1\sigma_1)\left[(1+x)\left\{\frac{i\sigma_1}{\varepsilon} + \frac{1}{P} + \frac{\pi^2 F}{P}(1+x)\right\}^2 + T_1\right]}{x\left(\frac{i\sigma_1}{\varepsilon} + \frac{1}{P} + \frac{\pi^2 F}{P}(1+x)\right)}, \qquad (20)$$

where

$$R_1 = R/\pi^4, T_1 = T_A/\pi^4, x = a^2/\pi^2,$$

$$i\sigma_1 = \sigma/\pi^2\ and\ P = \pi^2 P_l.$$

3 Important Theorems and Discussion

Here we discuss the case of stationary convection in Theorem 1, theoretically as well as analytically. In Theorems 2 – 4, the case of stability of the system and oscillatory modes discussed. In Theorem 5, the case of overstability discussed in which a sufficient condition for the non-existence of overstability is derived.

Theorem 1: For stationary convection case:

(I) In the absence of rotation, the couple-stress parameter postpones the onset of convection i.e. has a stabilizing effect and in the presence of rotation, the couple-stress parameter has both stabilizing and destabilizing effects on the system.

(II) In the absence of rotation, the medium permeability hastens the onset of convection i.e. has a destabilizing effect and in the presence of rotation, the medium permeability has both stabilizing and destabilizing effects on the system.

(III) Rotation postpones the onset of convection i.e. rotation has a stabilizing effect in couple-stress fluid heated from below in porous medium.

Proof: When the instability sets in as stationary convection, the marginal state will be characterized by $\sigma = 0$. Putting $\sigma = 0$, the dispersion relation (20) reduces to

$$R_1 = \frac{(1+x)[(1+x)\{1+\pi^2F(1+x)\}^2 + P^2T_1]}{xP\left(1+\pi^2F(1+x)\right)}. \qquad (21)$$

which expresses the Rayleigh number R_1 as a function of the dimensionless wave number x and the parameters F, P and T_1. To investigate the effects of couple-stress parameter, medium permeability and rotation, we examine the natur es of

$$\frac{dR_1}{dF}, \frac{dR_1}{dP}\ and\ \frac{dR_1}{dT_1}$$

analytically.

(I) Equation (21) yields

$$\frac{dR_1}{dF} = \frac{\pi^2(1+x)^2}{xP}\left[(1+x) - \frac{P^2T_1}{\{1+\pi^2F(1+x)\}^2}\right]. \qquad (22)$$

It is clear from equation (22) that in the absence of rotation, $\frac{dR_1}{dF}$ is always positive. So the couple-stress parameter postpones the onset of convection i.e. has a stabilizing effect on the system in the absence of rotation.

In the presence of rotation, if

$$T_1 < \frac{(1+x)\{1+\pi^2 F(1+x)\}^2}{P^2}, \qquad (23)$$

the couple-stress parameter postpones the onset of convection, whereas it is clear from equation (22) that if

$$T_1 > \frac{(1+x)\{1+\pi^2 F(1+x)\}^2}{P^2}. \qquad (24)$$

the couple-stress parameter hastens the onset of convection. Therefore, in the presence of rotation, under condition (23), the couple-stress parameter has stabilizing effect and under condition (24), the couple-stress parameter has a destabilizing effect.

(II) It is evident from equation (21) that

$$\frac{dR_1}{dP} = \frac{(1+x)}{x\{1+\pi^2 F(1+x)\}}\left[T_1 - \frac{(1+x)}{P^2}\{1 + \pi^2 F(1+x)\}^2\right]. \qquad (25)$$

It is clear from equation (25) that, for stationary convection, the medium permeability hastens the onset of convection in the absence of rotation i.e. has a destabilizing effect and also hastens the onset of convection in the presence of rotation if (23) holds good, whereas the medium permeability postpones the onset of convection if (24) holds good. The medium permeability thus has both stabilizing and destabilizing effects on the system in the presence of rotation.

(III) It is clear from equation (21) that

$$\frac{dR_1}{dT_1} = \frac{(1+x)P}{x\{1+\pi^2 F(1+x)\}}, \qquad (26)$$

which is always positive. So the rotation postpones the onset of convection i.e. has a stabilizing effect in couple-stress fluid heated from below in porous medium.

Analytical Explanation: The dispersion relation (21) analyzed numerically. In Figure 1a, R_1 is plotted against x for F = 2, 3, 4, and T_1 = 0. It is clear that the couple-stress postpones the onset of convection in the absence of rotation as the Rayleigh number increases with the increase in couple-stress parameter. In Figure 1b, R_1 is plotted against x for F = 1, 2, 3, 4, P = 100, and T_1 = 1. Here we also find that the couple-stress hastens the onset of convection in the presence of rotation for small wave numbers whereas the couple-stress postpones the onset of convection in the presence of rotation for higher wave numbers. In Figure 2a, R_1 is plotted against x for P = 10, 15, 20, F = 2, and T_1 = 0. It is clear that the medium permeability hastens the onset of convection in the absence of rotation as the Rayleigh number decreases with the increase in medium permeability parameter. In Figure 2b, R_1 is plotted against x for P = 10, 15, 20, 25, F = 2, and T_1 = 100. Here we also find that the medium permeability hastens the onset of convection in the presence of rotation for small wave numbers whereas the medium permeability postpones the onset of convection in the presence of rotation for higher wave numbers. In Figure 3, R_1 is plotted against x for T_1 = 100, 200, 300, P = 2, and F = 2. It is clear that the rotation postpones the onset of convection as the Rayleigh number increases with the increase in rotation parameter.

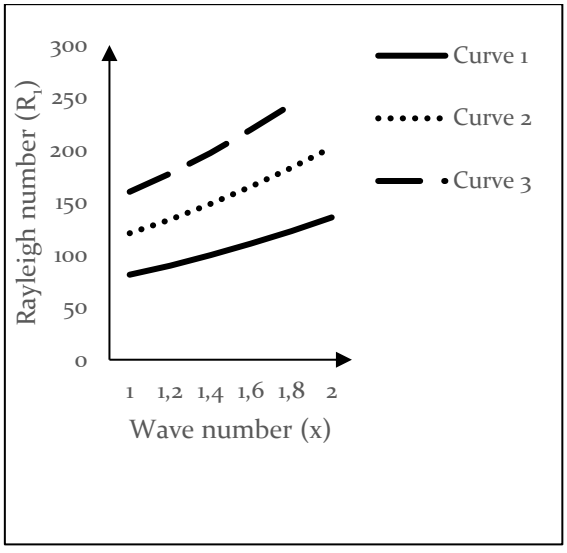

Fig 1a: The variation of Rayleigh number (R_1) with wave number (x) for P = 2, T_1 = 0, F = 2 for Curve 1, F = 3 for Curve 2 and F = 4 for Curve 3

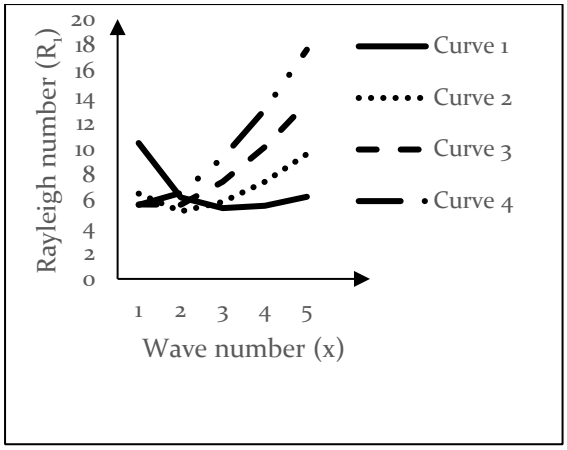

Fig 1b: The variation of Rayleigh number (R_1) with wave number (x) for P = 100, T_1 = 1, F = 1 for Curve 1, F = 2 for Curve 2, F = 3 for Curve 3 and F = 4 for Curve 4

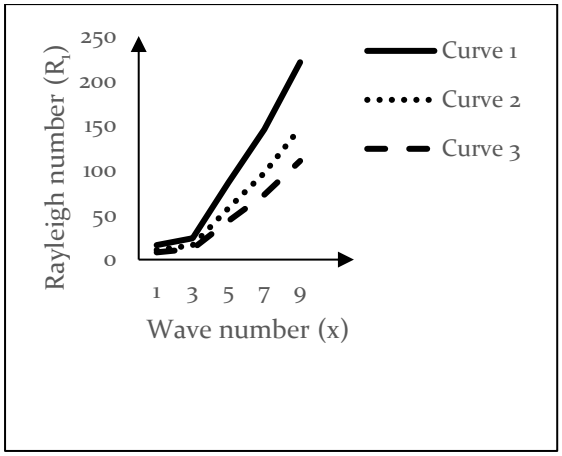

Fig 2a: The variation of Rayleigh number (R_1) with wave number (x) for F = 2, T_1 = 0, P = 10 for Curve 1, P = 15 for Curve 2 and P = 20 for Curve 3

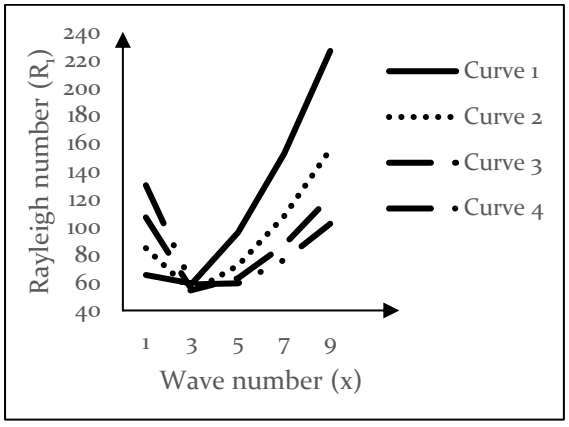

Fig 2b: The variation of Rayleigh number (R_1) with wave number (x) for F = 2, T_1 = 100, P = 10 for Curve 1, P = 15 for Curve 2, P = 20 for Curve 3 and P = 25 for Curve 4

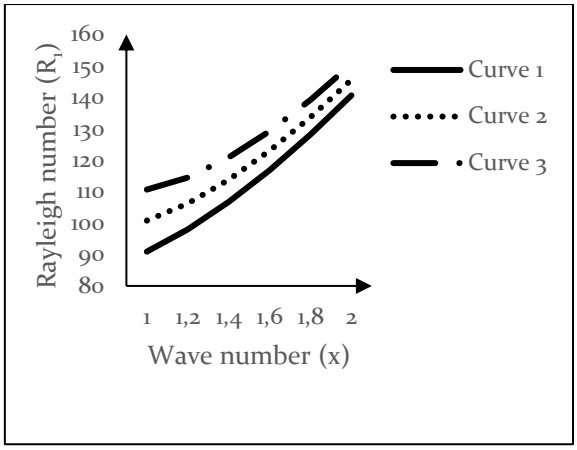

Fig 3: The variation of Rayleigh number (R_1) with wave number (x) for F = 2, P = 2, T_1 = 100 for Curve 1, T_1 = 200 for Curve 2 and T_1 = 300 for Curve 3

Theorem 2: The system is stable or unstable in the presence of couple-stress parameter, rotation and porous medium.

Proof: Multiplying equation (14) by W^*, the complex conjugate of W, integrating over the range of z, and making use of equations (15) and (16) together with the boundary conditions (18), we obtain

$$FI_1 + \left(1 + P_l \frac{\sigma}{\varepsilon}\right) I_2 - \frac{g\alpha\kappa a^2 P_l}{\nu\beta} [I_3 + Ep_1\sigma^* I_4] + d^2 \left[\left(1 + P_l \frac{\sigma^*}{\varepsilon}\right) I_6 + FI_5\right] = 0, \quad (27)$$

where

$$I_1 = \int_0^1 (|D^2W|^2 + 2a^2|DW|^2 + a^4|W|^2)dz,\ I_2 = \int_0^1 (|DW|^2 + a^2|W|^2)dz,$$

$$I_3 = \int_0^1 (|D\Theta|^2 + a^2|\Theta|^2)dz,\ I_4 = \int_0^1 |\Theta|^2 dz,\ I_5 = \int_0^1 (|DZ|^2 + a^2|Z|^2)dz,$$

$$I_6 = \int_0^1 (|Z|^2)dz, \quad (28)$$

which are all positive definite. Substituting $\sigma = \sigma_r + i\sigma_i$ and then equating real and imaginary parts of equation (27), we obtain

$$\sigma_r\left[\frac{I_2}{\varepsilon} - \frac{g\alpha\kappa a^2}{\nu\beta}Ep_1I_4 + \frac{d^2}{\varepsilon}I_6\right] = -\left[\frac{F}{P_l}I_1 + \frac{1}{P_l}I_2 - \frac{g\alpha\kappa a^2}{\nu\beta}I_3 + \frac{d^2}{P_l}I_6 + \frac{Fd^2}{P_l}I_5\right], \quad (29)$$

and

$$\sigma_i\left[\frac{I_2}{\varepsilon} + \frac{g\alpha\kappa a^2}{\nu\beta}Ep_1I_4 - \frac{d^2}{\varepsilon}I_6\right] = 0. \quad (30)$$

Equation (29) yields that σ_r may be positive or negative i.e. there may be stability or instability in the presence of couple-stress parameter, rotation and porous medium. The system is, therefore, either stable or unstable.

Theorem 3: The modes may be oscillatory or non-oscillatory in contrast to non-rotatory case.

Proof: Equation (30) yields that $\sigma_i = 0\ or\ \sigma_i \neq 0$, which means that the modes may be non-oscillatory or oscillatory.

In the absence of rotation, equation (30) reduces to

$$\sigma_i\left[\frac{I_2}{\varepsilon} + \frac{g\alpha\kappa a^2}{\nu\beta}Ep_1I_4\right] = 0, \quad (31)$$

and the terms in brackets are positive definite. Thus $\sigma_i = 0$, which means that oscillatory modes are not allowed and the principle of exchange of stabilities is satisfied for the couple-stress fluid heated from below in porous medium in the absence of rotation. It is clear from equation (30) that the presence of rotation brings oscillatory modes (as σ_i may not be zero) which were non-existent in its absence for a couple-stress fluid layer heated from below in porous medium.

Theorem 4: The system is stable for $\frac{g\alpha\kappa}{\nu\beta} \leq \frac{27\pi^4}{4}$ and under the condition $\frac{g\alpha\kappa}{\nu\beta} > \frac{27\pi^4}{4}$, the system becomes unstable.

Proof: From equation (30), it is clear that σ_i is zero when the quantity multiplying it is not zero and arbitrary when this quantity is zero.

If $\sigma_i \neq 0$, then equation (30) gives

$$\frac{I_2}{\varepsilon} = -\frac{g\alpha\kappa a^2}{\nu\beta}Ep_1I_4 + \frac{d^2}{\varepsilon}I_6$$

Substituting this in equation (29), we get

$$\frac{2\sigma_rI_2}{\varepsilon} + \frac{F}{P_l}I_1 + \frac{1}{P_l}I_2 + \frac{d^2}{P_l}I_6 + \frac{Fd^2}{P_l}I_5 = \frac{g\alpha\kappa a^2}{\nu\beta}I_3, \quad (32)$$

Equation (32) on using Rayleigh-Ritz inequality gives

$$\frac{(\pi^2+a^2)^3}{a^2}\int_0^1 |W|^2dz + \frac{(\pi^2+a^2)}{a^2}\left\{\frac{d^2}{P_l}I_6 + \frac{Fd^2}{P_l}I_5 + \frac{1}{P_l}I_2 + \frac{2\sigma_r}{\varepsilon}I_2 + \frac{F}{P_l}I_1\right\} \leq \frac{g\alpha\kappa}{\nu\beta}\int_0^1 |W|^2dz\ . \quad (33)$$

Therefore, it follows from equation (33) that

$$\left[\frac{27\pi^4}{4} - \frac{g\alpha\kappa}{\nu\beta}\right]\int_0^1 |W|^2dz + \frac{(\pi^2+a^2)}{a^2}\left\{\frac{d^2}{P_l}I_6 + \frac{Fd^2}{P_l}I_5 + \frac{1}{P_l}I_2 + \frac{2\sigma_r}{\varepsilon}I_2 + \frac{F}{P_l}I_1\right\} \leq 0, \quad (34)$$

since minimum value of $\frac{(\pi^2+a^2)^3}{a^2}$ with respect to a^2 is $\frac{27\pi^4}{4}$.

Now, let $\sigma_r \geq 0$, we necessary have from (34) that

$$\frac{g\alpha\kappa}{\nu\beta} > \frac{27\pi^4}{4}\ . \quad (35)$$

Hence, if

$$\frac{g\alpha\kappa}{\nu\beta} \leq \frac{27\pi^4}{4}\ , \quad (36)$$

then $\sigma_r < 0$. Therefore, the system is stable. Thus, under condition (36), the system is stable and under condition (35) the system becomes unstable.

Theorem 5: The sufficient condition for the non-existence of overstability is

$$\kappa < \left(\frac{\nu\varepsilon}{k_1}\right)^3 \left(\frac{d^2}{4\Omega^2\pi^2}\right)\left[\varepsilon + (1-\varepsilon)\frac{\rho_s c_s}{\rho_0 c_v}\right].$$

Proof: Here we discuss the possibility of whether instability may occur as overstability. Since for overstability, we wish to determine the critical Rayleigh number for the onset of instability via a state of pure oscillations, it suffices to find conditions for which equation (20) will admit of solutions with σ_1 real. Equating real and imaginary parts of equation (20), and eliminating R_1 from the resulting equations, we obtain

$$\sigma_1^2\left[\frac{b}{\varepsilon^2} + \frac{Ep_1}{\varepsilon}\left(\frac{1}{P} + \frac{\pi^2 Fb}{P}\right)\right] b + \left[b^2\left(\frac{1}{P} + \frac{\pi^2 Fb}{P}\right)^2 + Ep_1\varepsilon T_1\left(\frac{1}{P} + \frac{\pi^2 Fb}{P}\right)\right] + b\left[Ep_1\varepsilon\left(\frac{1}{P} + \frac{\pi^2 Fb}{P}\right)^3 - T_1\right] = 0, \quad (37)$$

where we have put $b = 1 + x$.

Since σ_1 is real for overstability, the value of σ_1^2 is positive. Equation (37) shows that this is impossible if

$$T_1 < \frac{Ep_1\varepsilon}{P^3}, \quad (38)$$

which means that

$$\kappa < \left(\frac{\nu\varepsilon}{k_1}\right)^3 \left(\frac{d^2}{4\Omega^2\pi^2}\right)\left[\varepsilon + (1-\varepsilon)\frac{\rho_s c_s}{\rho_0 c_v}\right]. \quad (39)$$

The condition (39) is, therefore, a sufficient condition for the non-existence of overstability, the violation of which does not necessarily imply the occurrence of overstability.

4 Conclusions

With the growing importance of non-Newtonian fluids in modern technology and industries, investigation of such fluids is desirable. Stokes [12] formulated the theory of couple-stress fluid. One of the applications of couple-stress fluid is its use in the study of mechanisms of lubrications of synovial joints, which has become the object of scientific research. A human joint is a dynamically loaded bearing that has articular cartilage as the bearing and synovial fluid as the lubricant. The shoulder, ankle, knee, and hip joints are the loaded-bearing synovial joints of the human body. Since long chain hyaluronic acid molecules are found as additives in synovial fluids, Walicki and Walicka modeled the synovial fluid as a couple-stress fluid. Therefore, an attempt has been made to investigate the effect of uniform rotation on a layer of couple-stress fluid heated from below in porous medium. . The main conclusions from the analysis of this paper are as follows:

- For the case of stationary convection, the couple-stress parameter and medium permeability has both stabilizing and destabilizing effects on the system whereas the rotation has a stabilizing effect on the system.
- It is found that rotation introduces oscillatory modes in the system which was non-existent in its absence.
- It is observed that the system is stable for $\frac{g\alpha\kappa}{\nu\beta} \leq \frac{27\pi^4}{4}$ and under the condition $\frac{g\alpha\kappa}{\nu\beta} > \frac{27\pi^4}{4}$, the system becomes unstable.
- The case of overstability is also considered. The condition
$$\kappa < \left(\frac{\nu\varepsilon}{k_1}\right)^3 \left(\frac{d^2}{4\Omega^2\pi^2}\right)\left[\varepsilon + (1-\varepsilon)\frac{\rho_s c_s}{\rho_0 c_v}\right]$$
is the sufficient condition for the non-existence of overstability, the violation of which does not necessarily imply the occurrence of overstability.

Abstract: The thermal convection of a plasma in porous medium is investigated to include simultaneously the effect of rotation and the finiteness of the ion Larmor radius (FLR) in the presence of a vertical magnetic field. Following linear stability theory and normal mode analysis method, the dispersion relation is obtained. It is found that the presence of a uniform rotation, finite Larmor radius and magnetic field introduces oscillatory modes in the system which were, otherwise, non-existent in their absence. When the instability sets in as stationary convection, finite Larmor radius, rotation, medium permeability and magnetic field are found to have stabilizing (or destabilizing) effects under certain conditions. In the absence of rotation, finite Larmor radius has stabilizing effect on the thermal instability of the system whereas the medium permeability and the magnetic field may have stabilizing or destabilizing effect under certain conditions. The conditions

$$\kappa < \left[\varepsilon + (1-\varepsilon)\frac{\rho_S C_S}{\rho_0 C}\right]\eta \;\; and \; \kappa < \frac{\varepsilon^2\left[\varepsilon + (1-\varepsilon)\frac{\rho_S C_S}{\rho_0 C}\right]\nu}{P^2\left[\varepsilon P\left\{\sqrt{U}(x-2) + \sqrt{T_{A_1}}\right\}^2 - 2Q_1\right]}$$

are the sufficient conditions for non-existence of overstability, the violation of which does not necessary involve an occurrence of overstability.

Key-Words: Thermal convection; plasma; finite Larmor radius effect; rotation; porous medium

1 Introduction

The theoretical and experimental results on thermal convection in a fluid layer, under varying assumptions of hydrodynamics and hydromagnetics, have been discussed in a treatise by Chandrasekhar [1]. The effects of the finiteness of the ion Larmor radius which exhibits itself in the form of 'magnetic viscosity' in the fluid equations have been studied by many authors (Jukes [2]; Vandakurov [3]). Sharma and Prakash [4] have studied the effect of finite Larmor radius on the thermal instability of a plasma. Melchior and Popowich [5] have considered the finite Larmor radius effect on the Kelvin-Helmholtz instability in a fully ionized plasma while that on Rayleigh-Taylor instability has been studied by Singh and Hans [6]. The effect of finite Larmor radius on the thermal instability of a plasma in the presence of a vertical magnetic field has been studied by Sharma [7]. Bhatia and Chhonkar [8] investigated the simultaneous effects of rotation and finite Larmor radius on the Rayleigh-Taylor instability of two viscous fluids.

The study of the breakdown of the stability of a layer of fluid subject to a vertical temperature gradient in porous medium and the possibility of convective flow is of considerable interest in recent years. The study of onset of convection in a porous medium has attracted considerable interest because of its natural occurrence and of its intrinsic importance in many industrial problems, particularly in petroleum-exploration, chemical and nuclear industries. The derivation of the basic equations of a layer of fluid heated from below in porous medium,

using Boussinesq approximation, has been given by Joseph [9]. The study of a layer of fluid heated from below in porous media is motivated both theoretically and by its practical applications in engineering disciplines. Among the applications in engineering disciplines one can find the food process industry, chemical process industry, solidification and centrifugal casting of metals. The development of geothermal power resources has increased general interest in the properties of convection in porous medium. Lapwood [10] has studied the stability of convective flow in a porous medium using Rayleigh's procedure. The Rayleigh instability of a thermal boundary layer in flow through a porous medium has been considered by Wooding [11].

The properties of ionized space and laboratory magnetic fluids (plasmas) have been intensively investigated theoretically and experimentally in the past sixty years. One of the key aspects studied in this context is the stability of plasma structures. Usually, instabilities can be divided into two categories: macro- and micro-instabilities. Macro-instabilities occur with low frequencies compared to the plasma and cyclotron frequency and they are studied within the framework of magnetohydrodynamics (MHD). Physicists have understood the behaviour of macro-instabilities and they showed how to avoid the most destructive of them, but small-scale gradient driven micro-instabilities are still a serious obstacle for having a stable plasma for a large range of parameters. Micro-instabilities are described by models which include, e.g. finite Larmor radius (FLR) and collisionless dissipative effects in plasmas. Time and length scales of micro-instabilities are comparable to the turbulent length scales and the length scales of transport coefficients. In general, the FLR effect is neglected. However, when the Larmor radius becomes comparable to the hydromagnetic length of the problem (e.g. wavelength) or the gyration frequency of ions in the magnetic field is of the same order as the wave frequency, finiteness of the Larmor radius must be taken into account. Strictly speaking, the space and time scale for the breakdown of hydromagnetics are on the respective scales of ion gyration about the field, and the ion Larmor frequency. In the present paper, we explore the effect of FLR on the thermal instability of a plasma in porous medium. Finite Larmor radius effect on plasma instabilities has been the subject of many investigations. In many astrophysical plasma situations such as in solar corona, interstellar and interplanetary plasmas the assumption of zero Larmor radius is not valid. Roberts and Taylor [12] and Rosenbluth et al. [13] have shown the stabilizing influence of finite ion Larmor radius (FLR) effects on plasma instabilities. Hernegger [14] investigated the stabilizing effect of FLR on thermal instability and showed that thermal criterion is changed by FLR for wave propagation perpendicular to the magnetic field. Sharma [15] investigated the stabilizing effect of FLR on thermal instability of rotating plasma. Ariel [16] discussed the stabilizing effect of FLR on thermal instability of conducting plasma layer of finite thickness surrounded by a non-conducting matter. Vaghela and Chhajlani [17] studied the stabilizing effect of FLR on magneto-thermal stability of resistive plasma through a porous medium with thermal conduction. Bhatia and Chhonkar [18] investigated the stabilizing effect of FLR on the instability of a rotating layer of self-gravitating plasma incorporating the effects of viscosity and Hall current. Vyas and Chhajlani [19] pointed out the stabilizing effect of FLR on the thermal instability of magnetized rotating plasma incorporating the effects of viscosity, finite electrical conductivity, porosity and thermal conductivity. Kaothekar and Chhajlani [20] investigated the problem of Jeans instability of self-gravitating rotating radiative plasma with finite Larmor radius corrections. Thus FLR effect is an important factor in the discussion of thermal convection and other hydromagnetic instabilities. Keeping these in mind, an attempt is made to study the effects of finite Larmor radius and rotation on the thermal convection of incompressible plasma in porous medium in the present paper.

2 Formulation of the Problem and Perturbation Equations

Consider an infinite, horizontal, incompressible, viscous and electrically conducting plasma layer of depth d bounded by the planes $z = 0$ and $z = d$ in an isotropic and homogeneous medium of porosity ε and medium permeability k_1. This layer is heated from below such that a steady temperature gradient $\beta(= \left|{}^{dT}/_{dz}\right|)$ is maintained. Temperatures and densities at the bottom surface $z = 0$ are T_0 and ρ_0 and at the upper surface $z = d$ are T_1 and ρ_1 respectively. The system is acted on by a uniform vertical magnetic field $\vec{H}(0, 0, H)$, a uniform rotation $\vec{\Omega}(0,\ 0,\ \Omega)$ and gravity field $\vec{g}(0, 0, -g)$. Let $\rho, T, \alpha, \kappa, g, \mu_e, \mu, \nu\left(= \frac{\mu}{\rho_0}\right), \eta$ and $\vec{\vec{P}}$ denote, respectively, the density, temperature, coefficient of thermal expansion, thermal diffusivity, gravitational acceleration, magnetic permeability, viscosity, kinematic viscosity, electrical resistivity and stress tensor taking into account the finite Larmor radius effect. When the plasma flows through a porous medium, the gross effect is represented by Darcy's law. As a result, the resistance term $-\left(\frac{\mu}{k_1}\right)\vec{q}$ replaces the usual viscous term, here $\vec{q}$ stands for the filter velocity of the plasma. Then the equations expressing the conservation of momentum, mass and heat are

$$\frac{1}{\varepsilon}\left[\frac{\partial \vec{q}}{\partial t} + \frac{1}{\varepsilon}(\vec{q}.\ \nabla)\vec{q}\right] = -\frac{1}{\rho_0}\nabla\left(\vec{\vec{P}} - \frac{1}{2\varepsilon^2}\left|\vec{\Omega} \times \vec{q}\right|^2\right) + \vec{g}\left(1 + \frac{\delta\rho}{\rho_0}\right) + \frac{\mu_e}{4\pi\rho_0}(\nabla \times \vec{\mathrm{H}}) \times \vec{H} - \frac{\nu}{k_1}\vec{q} + \frac{2}{\varepsilon}(\vec{q} \times \vec{\Omega}), \quad (1)$$

$$\nabla.\vec{q} = 0, \quad (2)$$

$$\frac{\partial T}{\partial t} + (\vec{q}.\nabla)T = \kappa\nabla^2 T, \quad (3)$$

where $= \varepsilon + (1 - \varepsilon)\frac{\rho_s C_s}{\rho_0 C}$; ρ_0, C are the density and heat capacity of the plasma and ρ_s, C_s are the density and the heat capacity of the solid (porous) material respectively.

The equation of the state is

$\rho = \rho_0[1 - \alpha(T - T_0)]$, where the suffix zero refers to the values at the reference level $z = 0$.

The Maxwell's equations yield

$$\varepsilon\frac{d\vec{H}}{dt} = (\vec{H}.\nabla)\vec{q} + \epsilon\eta\nabla^2\vec{H}, \quad (4)$$

$$\nabla.\vec{H} = 0, \quad (5)$$

where $d/dt = \partial/\partial t + (1/\varepsilon)(\vec{q}.\nabla)$ stands for the convective derivative.

For the magnetic field along the $z-$axis, the stress tensor $\vec{\vec{P}}$, taking into account the finite ion gyration radius (Vandakurov [3]), has the components

$$P_{xx} = p - \rho_0\nu_0\left(\frac{\partial u}{\partial y} + \frac{\partial v}{\partial x}\right),$$

$$P_{xy} = P_{yx} = \rho_0\nu_0\left(\frac{\partial u}{\partial x} - \frac{\partial v}{\partial y}\right),$$

$$P_{xz} = P_{zx} = -2\rho_0\nu_0\left(\frac{\partial v}{\partial z} + \frac{\partial w}{\partial y}\right), \quad (6)$$

$$P_{yy} = p + \rho_0\nu_0\left(\frac{\partial u}{\partial y} + \frac{\partial v}{\partial x}\right),$$

$$P_{yz} = P_{zy} = 2\rho_0\nu_0\left(\frac{\partial w}{\partial x} + \frac{\partial u}{\partial z}\right),$$

$$P_{zz} = p,$$

where p is the scalar part of the pressure and $\rho_0\nu_0 = Nk^*T/4\omega_H$, ω_H being the ion-gyration frequency, k^* is Boltzman constant, while N and T are number density and temperature of the ions, respectively.

The steady state solution is

$$\vec{q} = (0,\ 0,\ 0), T = T_0 - \beta z, \quad \rho = \rho_0(1 + \alpha\beta z), \quad (7)$$

where $\beta = \frac{T_0 - T_1}{d}$ is the magnitude of uniform temperature gradient which is maintained and is positive as temperature decreases upwards.

Now we consider a small perturbation on the steady state and let $\delta\rho, \delta\vec{\vec{P}}, \theta, \vec{q}(u,\ v, w)$ and $\vec{h}(h_x,\ h_y,\ h_z)$ denote, respectively, the perturbations in density, stress tensor,

temperature, hydromagnetic fluid velocity (initially zero) and the magnetic field. The change in density $\delta\rho$, caused by the perturbation θ in temperature, is given by

$$\delta\rho = -\alpha\rho_0\theta\,. \tag{8}$$

Then the linearized hydromagnetic perturbation equations relevant to the problem are

$$\frac{1}{\varepsilon}\frac{\partial\vec{q}}{\partial t} = -\frac{1}{\rho_0}\nabla\delta\vec{P} + \vec{g}\left(\frac{\delta\rho}{\rho_0}\right) + \frac{\mu_e}{4\pi\rho_0}(\nabla\times\vec{h}) \times\vec{H} - \frac{\nu}{k_1}\vec{q} + \frac{2}{\varepsilon}(\vec{q}\times\vec{\Omega})\,, \tag{9}$$

$$\nabla.\vec{q} = 0\,, \tag{10}$$

$$E\frac{\partial\theta}{\partial t} = \beta w + \kappa\nabla^2\theta\,, \tag{11}$$

$$\varepsilon\frac{\partial\vec{h}}{\partial t} = (\vec{H}.\nabla)\vec{q} + \epsilon\eta\nabla^2\vec{h}\,, \tag{12}$$

$$\nabla.\vec{h} = 0. \tag{13}$$

Within the framework of the Boussinesq approximation, equations (9) – (13) become

$$\left(\frac{\partial}{\partial t} + \frac{\nu\varepsilon}{k_1}\right)\nabla^2 = \varepsilon g\alpha\left(\frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2}\right)\theta + \frac{\mu_e H\varepsilon}{4\pi\rho_0}\frac{\partial}{\partial z}(\nabla^2 h_z) + \varepsilon\nu_0\left(\nabla^2 - 3\frac{\partial^2}{\partial z^2}\right)\frac{\partial\zeta}{\partial z} - 2\Omega\frac{\partial\zeta}{\partial z}, \tag{14}$$

$$\left(\frac{\partial}{\partial t} + \frac{\nu\varepsilon}{k_1}\right)\zeta = \frac{\mu_e\varepsilon H}{4\pi\rho_0}\frac{\partial\xi}{\partial z} - \varepsilon\nu_0\left(\nabla^2 - 3\frac{\partial^2}{\partial z^2}\right)\frac{\partial w}{\partial z} + 2\Omega\frac{\partial w}{\partial z}, \tag{15}$$

$$\varepsilon\frac{\partial\xi}{\partial t} = H\frac{\partial\zeta}{\partial z} + \varepsilon\eta\nabla^2\xi \tag{16}$$

$$\left[E\frac{\partial}{\partial t} - \kappa\nabla^2\right]\theta = \beta w, \tag{17}$$

$$\varepsilon\left[\frac{\partial}{\partial t} - \eta\nabla^2\right]h_z = H\frac{\partial w}{\partial z}, \tag{18}$$

where $\nabla^2 = {\partial^2}/{\partial x^2} + {\partial^2}/{\partial y^2} + {\partial^2}/{\partial z^2}$

and $\zeta = {\partial v}/{\partial x} - {\partial u}/{\partial y}$; $\xi = {\partial h_y}/{\partial x} - {\partial h_x}/{\partial y}$

stand for the z-components of vorticity and current density, respectively.

3 Dispersion Relation

Analyzing the disturbances into normal modes, we assume that the perturbation quantities are of the form

$$[w, h_z, \zeta, \xi, \theta] = [W(z), K(z), Z(z), X(z), \Theta(z)]exp\left[ik_x x + ik_y y + nt\right], \tag{19}$$

where k_x and k_y are the wave numbers along the $x-$ and $y-$ directions, respectively, $k = \sqrt{k_x^2 + k_y^2}$ is the resultant wave number, and n is, in general, a complex constant.

Using expression (19), equations (14)-(18) in non-dimensional form transform to

$$\left(\frac{\sigma}{\varepsilon} + \frac{1}{P_l}\right)(D^2 - a^2)W + \left(\frac{gd^2}{\nu}\right)a^2\alpha\Theta - \frac{\mu_e Hd}{4\pi\rho_0\nu}(D^2 - a^2)DK + \left(\frac{\nu_0 d}{\nu}\right)(2D^2 + a^2)DZ + \frac{2\Omega d^3}{\nu\varepsilon}DZ = 0, \tag{20}$$

$$\left(\frac{\sigma}{\varepsilon} + \frac{1}{P_l}\right)Z = \left(\frac{\mu_e Hd}{4\pi\rho_0\nu}\right)DX + \left(\frac{\nu_0}{\nu d}\right)(2D^2 + a^2)DW + \frac{2\Omega d}{\nu\varepsilon}DW, \tag{21}$$

$$[D^2 - a^2 - Ep_1\sigma]\Theta = -\left(\frac{\beta d^2}{\kappa}\right)W, \tag{22}$$

$$[D^2 - a^2 - p_2\sigma]K = -\left(\frac{Hd}{\varepsilon\eta}\right)DW, \tag{23}$$

$$[D^2 - a^2 - p_2\sigma]X = -\left(\frac{Hd}{\varepsilon\eta}\right)DZ, \qquad (24)$$

where we have introduced new coordinates $(x^*, y^*, z^*) = \left({}^{x}/_{d}, {}^{y}/_{d}, {}^{z}/_{d}\right)$ in the new unit of length d and $D = {}^{d}/_{dz^*}$. For convenience, the asterisks are dropped hereafter. Also we have put $a = kd$ and $\sigma = {}^{nd^2}/_{\nu}$, $p_1 = {}^{\nu}/_{\kappa}$ is the Prandtl number, $p_2 = {}^{\nu}/_{\eta}$ is the magnetic Prandtl number and $P_l = {}^{k_1}/_{d^2}$ is the dimensionless medium permeability.

Here we consider the case where both boundaries are free as well as perfect conductors of heat, while the adjoining medium is electrically non-conducting. The case of two free boundaries is slightly artificial, except in stellar atmospheres (Spiegel [21]) and in certain geophysical situations where it is most appropriate. However, the case of two free boundaries allows us to obtain analytical solution without affecting the essential features of the problem. The appropriate boundary conditions, with respect to which equations (20) – (24) must be solved, are

$$W = D^2W = 0,\ DZ = 0, \Theta = 0, X = 0 \ \ at\ z = 0\ and\ 1, \qquad (25)$$

on a perfectly conducting boundary.

The tangential components of the magnetic field are continuous in the absence of any surface current. Another boundary condition is

$$DK = 0 \text{ on the boundaries,} \qquad (26)$$

in addition to other boundary conditions given by the equation (25).

Using the above boundary conditions, it can be shown that all the even order derivatives of W must vanish for $z = 0\ and\ 1$ and hence the proper solution of W characterizing the lowest mode is

$$W = W_0 sin\,\pi z, \qquad (27)$$

where W_0 is a constant.

Eliminating $Z, K, X\ and\ \Theta$ between equations (20) - (24) and substituting the proper solution (27) in the resultant equation, we obtain the dispersion relation

$$\begin{aligned} R_1 x &= (1+x)\left(\frac{i\sigma_1}{\varepsilon} + \frac{1}{P}\right)(1 + x + iEp_1\sigma_1) \\ &+ Q_1 \frac{(1+x)(1+x+iEp_1\sigma_1)}{\varepsilon(1+x+ip_2\sigma_1)} \\ &+ \frac{(1+x+ip_2\sigma_1)(1+x+iEp_1\sigma_1)}{\left[(1+x+ip_2\sigma_1)\left(\frac{i\sigma_1}{\varepsilon}+\frac{1}{P}\right)+\frac{Q_1}{\varepsilon}\right]} \\ &+ \frac{\left[\sqrt{U}(x-2)+\sqrt{T_{A_1}}\right]^2}{\left[(1+x+ip_2\sigma_1)\left(\frac{i\sigma_1}{\varepsilon}+\frac{1}{P}\right)+\frac{Q_1}{\varepsilon}\right]}, \end{aligned} \qquad (28)$$

where

$$Q = \frac{\mu_e H^2 d^2}{4\pi\rho_0\nu\eta}, R = \frac{g\alpha\beta d^4}{\nu\kappa}, \ U = \frac{\nu_0^2}{\nu^2},$$

stand for the Chandrasekhar number, the thermal Rayleigh number, a non-dimensional number accounting for the finite Larmor radius, respectively, and we have also put

$$x = \frac{a^2}{\pi^2},\ P = \pi^2 P_l,\ i\sigma_1 = \frac{\sigma}{\pi^2},\ Q_1 = \frac{Q}{\pi^2},\ R_1 = \frac{R}{\pi^4}\ \ T_A = \frac{4\Omega^2 d^4}{\nu^2}(Taylor\ number),\ \ T_{A_1} = \frac{T_A}{\varepsilon^2\pi^4}\ and\ i = \sqrt{-1}\,.$$

4 Important Theorems and Discussion

Theorem 1: The system is stable or unstable.

Proof: Multiplying equation (20) by W^*, the complex conjugate of W, and using equations (21) - (24) together with the boundary conditions (25) and (26), we obtain

$$\begin{aligned} \left(\frac{\sigma}{\varepsilon}+\frac{1}{P_l}\right)I_1 - \frac{g\alpha\kappa a^2}{\nu\beta}(I_2 + Ep_1\sigma^* I_3) \\ + \frac{\mu_e\eta\varepsilon}{4\pi\rho_0\nu}(I_4 + p_2\sigma^* I_5) \\ + d^2\left(\frac{\sigma^*}{\varepsilon}+\frac{1}{P_l}\right)I_6 \\ + \frac{\mu_e\eta d^2\varepsilon}{4\pi\rho_0\nu}(I_7 + p_2\sigma I_8) \\ = 0\,, \end{aligned} \qquad (29)$$

where

$$I_1 = \int_0^1 (|DW|^2 + a^2|W|^2)\, dz,$$

$$I_2 = \int_0^1 (|D\Theta|^2 + a^2|\Theta|^2) dz,$$

$$I_3 = \int_0^1 (|\Theta|^2) dz,$$

$$I_4 = \int_0^1 (|D^2K|^2 + 2a^2|DK|^2 + a^4|K|^2) dz,$$

$$I_5 = \int_0^1 (|DK|^2 + a^2|K|^2) dz,$$

$$I_6 = \int_0^1 (|Z|^2) dz,$$

$$I_7 = \int_0^1 (|DX|^2 + a^2|X|^2) dz,$$

$$I_8 = \int_0^1 (|X|^2) dz, \qquad (30)$$

and σ^* is the complex conjugate of σ. The integrals $I_1, \ldots\ldots\ldots\ldots I_8$ are all positive definite. Putting $\sigma = \sigma_r + i\sigma_i$ and equating the real and imaginary parts of equation (29), we obtain

$$\left[\frac{I_1}{\varepsilon} + \frac{\mu_e \eta \varepsilon p_2}{4\pi\rho_0 \nu}(I_5 + d^2 I_8) - \frac{g\alpha\kappa a^2}{\nu\beta} E p_1 I_3 + \frac{d^2}{\varepsilon} I_6\right]\sigma_r =$$

$$-\left[\frac{1}{P_l} I_1 + \frac{\mu_e \eta \varepsilon}{4\pi\rho_0 \nu}(I_4 + d^2 I_7) - \frac{g\alpha\kappa a^2}{\nu\beta} I_2 + \frac{d^2}{P_l} I_6\right], \qquad (31)$$

and

$$\left[\frac{I_1}{\varepsilon} + \frac{g\alpha\kappa a^2}{\nu\beta} E p_1 I_3 - \frac{\mu_e \eta \varepsilon p_2}{4\pi\rho_0 \nu}(I_5 - d^2 I_8) - \frac{d^2}{\varepsilon} I_6\right]\sigma_i = 0\,. \qquad (32)$$

It is evident from equation (31) that σ_r may be positive or negative i.e. there may be instability or stability in the presence of rotation, finite Larmor radius and magnetic field in porous medium which is also true in their absence.

Theorem 2: The modes may be oscillatory or non-oscillatory in contrast to case of no magnetic field, and in the absence of rotation, finite Larmor radius and magnetic field where modes are non-oscillatory.

Proof: Equation (32) yields that σ_i may be zero or non-zero, which means that the modes may be non-oscillatory or oscillatory. In the absence of rotation, finite Larmor radius and magnetic field, equation (32) reduces to

$$\sigma_i \left[\frac{I_1}{\varepsilon} + \frac{g\alpha\kappa a^2}{\nu\beta} E p_1 I_3\right] = 0 \qquad (33)$$

and the terms in brackets are positive definite. Thus $\sigma_i = 0$, which means that oscillatory modes are not allowed and the principle of exchange of stabilities is satisfied for a porous medium in the absence of rotation, finite Larmor radius and magnetic field. The oscillatory modes are introduced due to the presence of rotation, magnetic field and finite Larmor radius which were non-existent in their absence.

Theorem 3: The system is stable for $\frac{g\alpha\kappa}{\nu\beta} \leq \frac{27\pi^4}{4}$ and under the condition $\frac{g\alpha\kappa}{\nu\beta} > \frac{27\pi^4}{4}$, the system becomes unstable.

Proof: From equation (32), it is clear that σ_i is zero when the quantity multiplying it is not zero and arbitrary when this quantity is zero.

If $\sigma_i \neq 0$, then equation (31) gives

$$\frac{I_1}{\varepsilon} + \frac{\mu_e \eta d^2 \varepsilon}{4\pi\rho_0 \nu} p_2 I_8 = \frac{\mu_e \eta \varepsilon}{4\pi\rho_0 \nu} p_2 I_5 + \frac{d^2}{\varepsilon} I_6 - \frac{g\alpha\kappa a^2}{\nu\beta} E p_1 I_3$$

Substituting this in equation (30), we get

$$\frac{2\sigma_r I_1}{\varepsilon} + \frac{1}{P_l} I_1 + \frac{\mu_e \eta \varepsilon}{4\pi\rho_0 \nu} I_4 + d^2\left(\frac{1}{P_l}\right) I_6 + \frac{\mu_e \eta d^2 \varepsilon}{4\pi\rho_0 \nu} I_7 + \frac{2\sigma_r \mu_e \eta d^2 \varepsilon}{4\pi\rho_0 \nu} p_2 I_8 = \frac{g\alpha\kappa a^2}{\nu\beta} I_2\,. \qquad (34)$$

Equation (34) on using Rayleigh-Ritz inequality gives

$$\frac{(\pi^2+a^2)^3}{a^2}\int_0^1 |W|^2\,dz + \frac{(\pi^2+a^2)}{a^2}\left\{\frac{2\sigma_r\mu_e\eta d^2\varepsilon}{4\pi\rho_0\nu}p_2 I_8 + \frac{\mu_e\eta d^2\varepsilon}{4\pi\rho_0\nu}I_7 + d^2\left(\frac{1}{P_l}\right)I_6 + \frac{\mu_e\eta\varepsilon}{4\pi\rho_0\nu}I_4 + \frac{1}{P_;}I_1 + \frac{2\sigma_r}{\varepsilon}I_1\right\} \leq \frac{g\alpha\kappa}{\beta\nu}\int_0^1 |W|^2\,dz \quad . \tag{35}$$

Therefore, it follows from equation (35) that

$$\left[\frac{27\pi^4}{4} - \frac{g\alpha\kappa}{\nu\beta}\right]\int_0^1 |W|^2\,dz + \frac{(\pi^2+a^2)}{a^2}\left\{\frac{2\sigma_r\mu_e\eta d^2\varepsilon}{4\pi\rho_0\nu}p_2 I_8 + \frac{\mu_e\eta d^2\varepsilon}{4\pi\rho_0\nu}I_7 + d^2\left(\frac{1}{P_l}\right)I_6 + \frac{\mu_e\eta\varepsilon}{4\pi\rho_0\nu}I_4 + \frac{1}{P_;}I_1 + \frac{2\sigma_r}{\varepsilon}I_1\right\} \leq 0 \tag{36}$$

since minimum value of $\frac{(\pi^2+a^2)^3}{a^2}$ with respect to a^2 is $\frac{27\pi^4}{4}$.

Now, let $\sigma_r \geq 0$, we necessary have from (36) that

$$\frac{g\alpha\kappa}{\nu\beta} > \frac{27\pi^4}{4} \quad . \tag{37}$$

Hence, if

$$\frac{g\alpha\kappa}{\nu\beta} \leq \frac{27\pi^4}{4} \quad , \tag{38}$$

then $\sigma_r < 0$. Therefore, the system is stable. Thus, under condition (38), the system is stable and under condition (37) the system becomes unstable.

Theorem 4: For stationary convection case:

(I) If $x > 2$, both finite Larmor radius and rotation have a stabilizing effect on the system. On the other hand if $x < 2$, finite Larmor radius has stabilizing (or destabilizing) effect and rotation has destabilizing (or stabilizing) effect if

$$(x-2) > (or\ <)\ \left(\frac{T_{A_1}}{U}\right)^{1/2}.$$

(II) In the presence of finite Larmor radius effect and rotation if

$$\left[\frac{1+x}{P} + \frac{Q_1}{\varepsilon}\right]^2 > (or\ <)\ \left\{\sqrt{U}(x-2) + \sqrt{T_{A_1}}\right\}^2 (1+x)$$

the medium permeability has a destabilizing (or stabilizing) and the magnetic field has a stabilizing (or destabilizing) effect on the system.

(III) In the absence of rotation, finite Larmor radius always has a stabilizing effect on the system whereas the medium permeability and the magnetic field may have stabilizing effect for some wave numbers and destabilizing effect for other wave numbers given by

$$U(x-2)^2(1+x) \geqq \left(\frac{1+x}{P} + \frac{Q_1}{\varepsilon}\right)^2.$$

Proof: When the instability sets in as stationary convection, the marginal state will be characterized by $\sigma = 0$. Putting $\sigma = 0$, the dispersion relation (28) reduces to

$$R_1 = \left(\frac{1+x}{x}\right)\left[\frac{1+x}{P} + \frac{Q_1}{\varepsilon}\right] + \frac{\left[U^{1/2}(x-2) + {T_{A_1}}^{1/2}\right]^2 (1+x)^2}{x\left[\frac{1+x}{P} + \frac{Q_1}{\varepsilon}\right]}, \tag{39}$$

which expresses the modified Rayleigh number R_1 as a function of the dimensionless wave number x and the parameters $Q_1, U\ P\ and\ T_{A_1}$. To study the effects of finite Larmor radius, rotation, medium permeability and magnetic field on R_1, we examine the nature of $dR_1/dU\ , dR_1/dT_{A_1},\ dR_1/dP\ and\ dR_1/dQ_1$ analytically.

(I) It follows from equation (39),

$$\frac{dR_1}{dU} = \frac{(x-2)(1+x)^2\left[(x-2)+\left(\frac{T_{A_1}}{U}\right)^{1/2}\right]}{x\left[\frac{1+x}{P}+\frac{Q_1}{\varepsilon}\right]}, \quad (40)$$

and

$$\frac{dR_1}{dT_{A_1}} = \frac{(1+x)^2\left(\frac{U}{T_{A_1}}\right)^{1/2}\left[(x-2)+\left(\frac{T_{A_1}}{U}\right)^{1/2}\right]}{x\left[\frac{1+x}{P}+\frac{Q_1}{\varepsilon}\right]}. \quad (41)$$

If $x > 2$, both finite Larmor radius and rotation have a stabilizing effect on the system.

If < 2 , finite Larmor radius has stabilizing (or destabilizing) effect and rotation has destabilizing (or stabilizing) effect if

$$(x-2) > (or <)\left(\frac{T_{A_1}}{U}\right)^{1/2}. \quad (42)$$

(II) Also equation (39) yields

$$\frac{dR_1}{dP} = -\frac{(1+x)}{xP^2}\left[\frac{\left(\frac{1+x}{P}+\frac{Q_1}{\varepsilon}\right)^2-\left\{\sqrt{U}(x-2)+\sqrt{T_{A_1}}\right\}^2}{\left(\frac{1+x}{P}+\frac{Q_1}{\varepsilon}\right)^2}\right], \quad (43)$$

and

$$\frac{dR_1}{dQ_1} = \left(\frac{1+x}{\varepsilon x}\right)\left[\frac{\left(\frac{1+x}{P}+\frac{Q_1}{\varepsilon}\right)^2-\left\{\sqrt{U}(x-2)+\sqrt{T_{A_1}}\right\}^2(1+x)}{\left(\frac{1+x}{P}+\frac{Q_1}{\varepsilon}\right)^2}\right], \quad (44)$$

In the equations (43) and (44) if

$$\left[\frac{1+x}{P}+\frac{Q_1}{\varepsilon}\right]^2 > \left\{\sqrt{U}(x-2)+\sqrt{T_{A_1}}\right\}^2(1+x), \quad (45)$$

then

$$\frac{dR_1}{dP} < 0 \; and \; \frac{dR_1}{dQ_1} > 0,$$

which exhibits the destabilizing effect of medium permeability and stabilizing effect of magnetic field respectively.

Again if

$$\left[\frac{1+x}{P}+\frac{Q_1}{\varepsilon}\right]^2 < \left\{\sqrt{U}(x-2)+\sqrt{T_{A_1}}\right\}^2(1+x), \quad (46)$$

then

$$\frac{dR_1}{dP} > 0 \; and \; \frac{dR_1}{dQ_1} < 0,$$

which shows the stabilizing effect of medium permeability and destabilizing effect of the magnetic field on the thermal instability of a plasma in porous media in the light of condition (46).

(III) In the absence of rotation,

$$\frac{dR_1}{dU} = \frac{(x-2)^2(1+x)^2}{x\left[\frac{1+x}{P}+\frac{Q_1}{\varepsilon}\right]} > 0, \quad (47)$$

$$\frac{dR_1}{dP} = -\frac{(1+x)^2}{xP^2}\frac{\left[\left(\frac{1+x}{P}+\frac{Q_1}{\varepsilon}\right)^2-U(x-2)^2(1+x)\right]}{\left(\frac{1+x}{P}+\frac{Q_1}{\varepsilon}\right)^2}, \quad (48)$$

and

$$\frac{dR_1}{dQ_1} = \left(\frac{1+x}{\varepsilon x}\right)\frac{\left[\left(\frac{1+x}{P}+\frac{Q_1}{\varepsilon}\right)^2-U(x-2)^2(1+x)\right]}{\left(\frac{1+x}{P}+\frac{Q_1}{\varepsilon}\right)^2}. \quad (49)$$

Now

$$\frac{dR_1}{dP} \gtrless 0 \; and \; \frac{dR_1}{dQ_1} \lessgtr 0$$

according as

$$U(x-2)^2(1+x) \gtrless \left(\frac{1+x}{P}+\frac{Q_1}{\varepsilon}\right)^2. \quad (50)$$

Thus in the absence of rotation, finite Larmor radius always has a stabilizing effect on the thermal instability of plasma whereas the

medium permeability and magnetic field may have stabilizing effect for some wave numbers and destabilizing effect for other wave numbers given by relation (50).

Theorem 5: The sufficient conditions for the non-existence of overstability are

$$\kappa < \left[\varepsilon + (1-\varepsilon)\frac{\rho_S C_S}{\rho_0 C}\right]\eta \ \ and$$

$$\kappa < \frac{\varepsilon^2\left[\varepsilon + (1-\varepsilon)\frac{\rho_S C_S}{\rho_0 C}\right]\nu}{P^2\left[\varepsilon P\left\{\sqrt{U}(x-2)+\sqrt{T_{A_1}}\right\}^2 - 2Q_1\right]}.$$

Proof: Here we discuss the possibility of whether instability may occur as overstability. Since for overstability, our interest is to determine the critical Rayleigh number for the onset of instability via a state of pure oscillations, it will suffice to find conditions for which equation (28) will admit solutions with σ_1 real.

Assuming σ_1 to be real and equating the real and imaginary parts of equation (28) and eliminating R_1 between them, we obtain

$$A_3 C_1^3 + A_2 C_1^2 + A_1 C_1 + A_0 = 0\,, \qquad (51)$$

where $C_1 = \sigma_1^2\,,\ b = 1 + x\ and$

$$A_3 = \frac{b p_2^4}{\varepsilon^2}\left(\frac{Ep_1}{P} + \frac{b}{\varepsilon}\right), \qquad (52)$$

$$A_0 = \frac{b^6}{\varepsilon P^2} + \left[\left(\frac{Ep_1}{P^3} + \frac{2Q_1}{\varepsilon^2 P}\right) - \left\{\frac{\sqrt{U}(b-3)-\sqrt{T_{A_1}}}{\varepsilon}\right\}^2\right] b^5 + \left[\frac{Q_1^2}{\varepsilon^3} + \frac{Q_1}{\varepsilon P^2}(3Ep_1 - p_2) + \left\{\sqrt{U}(b-3)+\sqrt{T_{A_1}}\right\}^2 \frac{Ep_1}{P}\right] b^4 + \left[\frac{Q_1^2}{\varepsilon^2 P}(3Ep_1 - 2p_2) + \left\{\sqrt{U}(b-3) + \sqrt{T_{A_1}}\right\}^2\left(\frac{p_2 Q_1}{\varepsilon} + \frac{Ep_1 Q_1}{\varepsilon}\right)\right] b^3 + \frac{Q_1^3}{\varepsilon^3}(Ep_1 - p_2) b^2. \qquad (53)$$

The values of coefficients $A_1\ and\ A_2$ are not written here because their expressions are very lengthy and also not needed in the discussion of overstability. Since σ_1 is real for overstability, the three values of $C_1(=\sigma_1^2)$ are positive. The product of the roots of (51) is $-A_0/A_3$ and if this is to be positive, then A_0 must be negative since from (52) A_3 is positive.

It is clear from (53) that A_0 is always positive if

$$Ep_1 > p_2\,, \quad and \quad \left(\frac{Ep_1}{P^3} + \frac{2Q_1}{\varepsilon^2 P}\right) > \frac{1}{\varepsilon}\left\{\sqrt{U}(b-3) + \sqrt{T_{A_1}}\right\}^2 \qquad (54)$$

which implies that

$$\kappa < \left[\varepsilon + (1-\varepsilon)\frac{\rho_S C_S}{\rho_0 C}\right]\eta \ \ and\ \kappa < \frac{\varepsilon^2\left[\varepsilon + (1-\varepsilon)\frac{\rho_S C_S}{\rho_0 C}\right]\nu}{P^2\left[\varepsilon P\left\{\sqrt{U}(x-2)+\sqrt{T_{A_1}}\right\}^2 - 2Q_1\right]}. \qquad (55)$$

The inequalities (55) are, therefore, the sufficient conditions for the non-existence of overstability, the violation of which does not necessarily imply the occurrence of overstability.

5 Conclusions

The thermal convection of a plasma in porous medium in the presence of finite Larmor radius effect, rotation and vertical magnetic field is considered in the present paper. The main conclusions from the analysis of this paper are as follows:

- It is found that rotation, finite Larmor radius and uniform magnetic field introduce oscillatory modes in the system which were non-existent in their absence.
- It is observed that the system is stable for $\frac{g\alpha\kappa}{\nu\beta} \le \frac{27\pi^4}{4}$ and under the condition $\frac{g\alpha\kappa}{\nu\beta} > \frac{27\pi^4}{4}$, the system becomes unstable.
- For the case of stationary convection, if $x > 2$, both finite Larmor radius and rotation have a stabilizing effect on the system. On the other hand if $x < 2$, finite Larmor radius has stabilizing (or destabilizing) effect and rotation has destabilizing (or stabilizing) effect if

$$(x-2) > (or\ <)$$

$$\left(\frac{T_{A_1}}{U}\right)^{1/2}.$$

In the presence of finite Larmor radius effect and rotation if

$$\left[\frac{1+x}{P}+\frac{Q_1}{\varepsilon}\right]^2 > (or\ <)$$
$$\left\{\sqrt{U}(x-2)+\sqrt{T_{A_1}}\right\}^2 (1+x)$$

the medium permeability has a destabilizing (or stabilizing) and the magnetic field has a stabilizing (or destabilizing) effect on the system.

- In the absence of rotation, finite Larmor radius always has a stabilizing effect on the system whereas the medium permeability and the magnetic field may have stabilizing effect for some wave numbers and destabilizing effect for other wave numbers given by

$$U(x-2)^2(1+x) \gtrless \left(\frac{1+x}{P}+\frac{Q_1}{\varepsilon}\right)^2.$$

- The case of overstability is also considered. The conditions

$$\kappa < \left[\varepsilon+(1-\varepsilon)\frac{\rho_S C_S}{\rho_0 C}\right]\eta \ \ and\ \kappa < \frac{\varepsilon^2\left[\varepsilon+(1-\varepsilon)\frac{\rho_S C_S}{\rho_0 C}\right]\nu}{P^2\left[\varepsilon P\left\{\sqrt{U}(x-2)+\sqrt{T_{A_1}}\right\}^2-2Q_1\right]}.$$

are the sufficient conditions for the non-existence of overstability, the violation of which does not necessarily imply the occurrence of overstability.

Summerhill, Shimla-171005, INDIA.

Abstract:- The thermal-convective instability of a stellar atmosphere in the presence of stable solute gradient in Stern's type configuration is studied in the presence of radiative transfer effect. A criterion for monotonic instability is obtained in terms of the source functions S. The criterion for monotonic instability is found to be unchanged in the presence of radiative transfer and rotation effects. The problem of thermosolutal-convective instability of a hydromagnetic composite medium is also studied to include the frictional effects with neutrals. The criterion derived for monotonic instability in terms of heat-loss function is found to be the same in the presence or absence of the collisional effects.

Key-Words:-Frictional effects, Thermosolutal-convective instability, Radiative transfer effect, Rotation,

1. Introduction

Defouw [1] has generalized the Schwarzschild criterion for convection to include departures from adiabatic motion and has shown that a thermally unstable atmosphere is also convectively unstable, irrespective of the atmospheric temperature gradient. The instability in which motions are driven by buoyancy forces of a thermally unstable atmosphere has been termed as "thermal convective instability". Defouw [1] has shown that an inviscid stellar atmosphere is unstable is unstable if

$$D = \frac{1}{C_P}\left(L_T - \rho\alpha L_\rho\right) + \kappa k^2 < 0, \qquad (1)$$

where L is the energy lost minus the energy gained per gram per second (the heat loss function) and ρ, α, κ, k, L_T, L_ρ denote respectively the density, the coefficient of thermal expansion, the coefficient of thermometric conductivity, the wave number of the perturbation, the partial derivative of L with respect to temperature T and the partial derivative of L with respect to density ρ, both evaluated in the equilibrium state. In general, the instability due to inequality (1) may be either oscillatory or monotonic. Defouw [1] has also shown that inequality (1) is a sufficient condition for monotonic instability in the presence of magnetic field and rotation on thermal convective instability.

Defouw [1] has also studied the effect of radiative transfer on the thermal-convective instability and has found that the source functions S which lead to thermal-convective instability are those for which $S_T - (\rho/T)S_\rho < 0$, the subscripts on S denote the partial derivatives of S with respect to T and ρ both evaluated in the equilibrium state.

A detailed account of thermal convection, under varying assumptions of hydrodynamics and hydromagnetics, has been given by Chandrasekhar [2]. Veronis [3] has considered the problem of thermohaline convection in a layer of fluid heated from below and subjected to a stable salinity gradient. The thermohaline convection in a horizontal layer of viscous fluid heated from below and salted from above has been studied by Nield [4]. In thermohaline-convective instability problem, buoyancy forces can arise not from density differences due to variations in temperature but also from those due to variations in solute concentrations. The conditions under which convective motions are important in stellar atmospheres are usually far

removed the consideration of a single component fluid and rigid boundaries and therefore it is desirable to consider one gas component acted on by solute concentration gradient and free boundaries. The thermosolutal-convective instability of a stellar atmosphere in the presence of suspended particles has been studied by Sharma and Singh [5]. The criteria for monotonic instability are derived and are found to hold good also in the presence of uniform rotation and uniform magnetic field on the thermosolutal-convective instability.

A partially ionized plasma represents a state which often exists in the Universe. There are several situations where the interaction between the ionized and neutral gas components becomes important in cosmic physics. As a reasonably simple approximation, the plasma may be idealized as a composite mixture of a hydromagnetic (ionized) component and a neutral component, the two interacting through mutual collisional (frictional) effects. Hans [6] made this simplified approximation and found that these collisions have a stabilizing effect on the Rayleigh-Taylor instability.Marcu and Ballai [7] have studied the thermosolutal linear stability of a composite two-component plasma in the presence of Coriolis forces, finite Larmor radius, taking into account the collisions between neutral and ionized particles. The thermosolutal instability appears due to a material convection (thermosolutal convection) in a two component fluid with different molecular diffusivities which contribute in an opposing sense to the locally vertical density gradient. Natural convection with Soret and radiation effects in a binary fluid saturating a horizontal porous layer under the influence of magnetic field has been investigated by Israel-Cookey and Amos [8]. Sheri et. al [9] has studied the transient radiative reactive thermosolutal magnetohydrodynamic convection in inclined MHD hall generator flow with dissipation and cross diffusion.

In the present paper we consider the thermosolutal-convective instability in Stern's type configuration of a stellar atmosphere (the thermal-convective instability in the presence of stable solute gradient) to include the radiative transfer effect. The effects of radiative transfer and rotation are also studied on the thermosolutal-convective instability. The effects of radiative transfer arise when self absorption is not negligible. As a partially ionized plasma represents a state which often exists in the Universe, the problem of thermosolutal-convective instability of a hydromagnetic composite medium is, therefore, studied to include the frictional effects with neutrals. Theseaspects form the subject matter of the present study.

2. Description of the Instability and Perturbation Equations

Consider an infinite horizontal fluid layer of thickness d heated from above and subjected to a stable solute concentration gradient so that the temperatures and solute concentrations at the bottom surface $z = 0$are T_0 and C_0 and at the upper surface $z = d$ are T_1 and C_1 respectively, z -axis being taken as vertical. This layer is acted on by a gravity force $\vec{g}(0,\ 0,\ -g)$. Then, following the Boussinesq approximation, which states that the inertial effects produced by density variation are negligible in comparison to its gravitational effects i.e. ρ can be taken as constant everywhere in the equations of motion except in the term with external force, consequently the equations governing the motion of the fluid assume the following form:

$$\frac{\partial \vec{v}}{\partial t} + (\vec{v}\ .\ \nabla)\vec{v} = -\frac{1}{\rho_0}\nabla p + \nu\,\nabla^2\vec{v} + \vec{g}\left(1 + \frac{\delta\rho}{\rho_0}\right), \tag{2}$$

$$\nabla.\vec{v} = 0\,, \tag{3}$$

$$\frac{\partial C}{\partial t} + (\vec{v}\ .\ \nabla)C = \kappa'\nabla^2 C\,, \tag{4}$$

$$\rho = \rho_0[1 - \alpha(T - T_0) + \alpha'(C - C_0)]. \tag{5}$$

The suffix zero refers to values at the reference level $z = 0$. Equations (2) – (4) express respectively the conservation of momentum,

mass and solute mass concentration. Equation (5) represents the equation of state. Here $\rho, p, T, C, \vec{v}(u, v, w), g, \alpha \; and \; \alpha'$ stand for density, pressure, temperature, solute concentration, velocity, gravitational acceleration, thermal coefficient of expansion and an analogous solvent coefficient, respectively. The kinematic viscosity, the thermal diffusivity κ and the solute diffusivity κ' are each assumed to be constant.

The steady state solution is

$$\vec{v} = 0, T = T_0 + \beta z, C = C_0 - \beta' z, \rho = \rho_0[1 - \alpha\beta z - \alpha'\beta' z'], \quad (6)$$

where

$$\beta = \frac{T_1 - T_0}{d}, and \; \beta' = \frac{C_0 - C_1}{d}$$

are the magnitudes of uniform temperature and concentration gradients.

We now consider a small perturbation on the steady state solution and let $\vec{v}, \delta\rho, \delta p, \theta$ and γ denote the perturbations in velocity, density, pressure, temperature and solute concentration respectively so that the change in density $\delta\rho$, caused by the perturbations $\theta \; and \; \gamma$ in temperature and concentration, is given by

$$\delta\rho = -\rho_0(\alpha\theta - \alpha'\gamma). \quad (7)$$

Equations (2) – (4) on linearization give

$$\frac{\partial \vec{v}}{\partial t} = -\frac{1}{\rho_0}\nabla\delta p + \nu\nabla^2\vec{v} - \vec{g}(\alpha\theta - \alpha'\gamma), \quad (8)$$

$$\nabla . \vec{v} = 0, \quad (9)$$

$$\frac{\partial \gamma}{\partial t} - \kappa'\nabla^2\gamma = \beta' w. \quad (10)$$

Now, the first law of thermodynamics may be written in the form

$$C_v\frac{dT}{dt} = -L + \frac{K}{\rho}\nabla^2 T + \frac{P}{\rho^2}\frac{d\rho}{dt}, \quad (11)$$

where $L, K, C_v, T, t \; and \; \rho$ denote respectively, the heat-loss function, the thermal conductivity, the specific heat at constant volume, the temperature, the time and the pressure.

Following Defouw [1], the linearized perturbation form of equation (11) is

$$\frac{\partial\theta}{\partial t} + \frac{1}{C_p}(L_T - \rho\alpha L_\rho)\theta - \kappa\nabla^2\theta = -\left(\beta + \frac{g}{C_P}\right)w. \quad (12)$$

The effects of radiative transfer arise when self-absorption is not negligible. In considering the heat-loss function $L(\rho, T)$ to be dependent only on the local values of density and temperature, it is assumed that the gas is optically thin. We shall study radiative transfer with the Eddington approximation which is accurate in both the optically thick and optically thin limits as pointed by Unno and Spiegel [10].

The heat equation for a grey gas, using this approximation, may be written as

$$\rho C_v\frac{dT}{dt} - \frac{p}{\rho}\frac{d\rho}{dt} = \nabla.\left[\frac{1}{3m\rho}\nabla\left\{\frac{1}{m\rho}\left(\rho C_v\frac{dT}{dt} - \frac{p}{\rho}\frac{d\rho}{dt}\right) + 4\pi S\right\}\right], \quad (13)$$

where m is the mass absorption coefficient and S is the source function.

Since the layer depth is small and the temperature gradient maintained is also small so that their product is very small in comparison with the temperature of the lower boundary, the temperature at an intermediate point may be approximately taken as the temperature of the lower boundary. The source function S and the mass absorption coefficient m may, therefore, be treated as independent of height in the equilibrium state. Then the linearized perturbation form of equation (12) may be obtained as

$$3m^2\rho^2\frac{\partial\theta}{\partial t} - \frac{4\pi m}{C_P}(S_T - \rho\alpha S_P)\nabla^2\theta - \frac{\partial}{\partial t}\nabla^2\theta = -\left(\beta + \frac{g}{C_P}\right)(3m^2\rho^2 w - \nabla^2 w), \quad (14)$$

where S_T and S_ρ denote respectively the partial derivatives of S with respect to T and ρ.

We consider the case in which the boundaries are free as well as perfect conductors of both heat and solute. The density changes arise principally from thermal effects. The case of two free boundaries is most appropriate for stellar atmospheres as pointed by Spiegel [11]. The boundary conditions appropriate for the problem are

$$w = {\partial^2 w}/{\partial z^2} = \theta = \gamma = 0.$$

3. The Dispersion Relation

We shall now analyze an arbitrary perturbation into complete set of normal modes by seeking solutions whose dependence on space and time coordinates is of the form

$$exp\left(ik_x x + ik_y y + nt\right) \sin k_z z\,, \qquad (15)$$

where n is the growth rate and $k_z = {s\pi}/{d}$, s being any integer and d is the thickness of the layer and $k = \left(k_x^2 + k_y^2 + k_z^2\right)^{1/2}$ is the wave number of the perturbation.

Equations (8) – (10) and (14) give

$$\frac{\partial}{\partial t}(\nabla^2 w) = g\left(\frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2}\right)(\alpha\theta - \alpha'\gamma) + \nu\nabla^4 w\,, \qquad (16)$$

$$\left(\frac{\partial}{\partial t} - \kappa'\nabla^2\right)\gamma = \beta' w\,, \qquad (17)$$

$$\left(\frac{\partial}{\partial t} + E\right)\theta = -\left(\beta + \frac{g}{C_P}\right)w\,, \qquad (18)$$

where

$$E = \frac{4\pi m\left(S_T - \rho\alpha S_\rho\right)}{C_P\left(1 + \frac{3m^2\rho^2}{k^2}\right)}\ . \qquad (19)$$

The system of equations (16) - (18) together with boundary conditions

$$w = {\partial^2 w}/{\partial z^2} = \theta = \gamma = 0.$$

constitutes a characteristics value problem for n, for given values of the parameters and a given state of system is stable, neutral or unstable according as n_r , the real part of n, is negative , zero or positive. Further, if $n_r = 0 \Rightarrow n_i = 0$ for all wave number k, then the principle of exchange of stabilities (PES) is valid otherwise we have overstability atleast when instability sets in as certain modes. The above system of equations can be solved by using linear stability analysis method.

Eliminating θ, γ from equations $(16) - (18)$ and using (16), we obtain the dispersion relation

$$n^3 + [E + k^2(\nu + \kappa')]n^2 + \left[k^2 E(\nu + \kappa') + \Gamma\left(\beta + \frac{g}{C_P}\right) + \nu\kappa' k^4 + \Gamma'\beta'\right]n + \left[\Gamma\left(\beta + \frac{g}{C_P}\right)\kappa' k^2 + (\nu\kappa' k^4 + \Gamma'\beta')E\right] = 0\,, \qquad (20)$$

where

$$\Gamma = g\alpha\frac{k_x^2 + k_y^2}{k^2}\ and\ \Gamma' = \frac{g\alpha'\left(k_x^2 + k_y^2\right)}{k^2}. \qquad (21)$$

4. Discussion and Further Extensions

Theorem 1: Acriterion that a stellar atmosphere in the presence of stable solute concentration gradient and radiative transfer effect is unstable if

$$S_T - \frac{\rho}{T}S_\rho < 0\ and\ |(\nu\kappa' k^4 + \Gamma'\beta')E| > \Gamma\left(\beta + \frac{g}{C_P}\right)\kappa' k^2\ .$$

Proof: Taking the dispersion relation (20), when

$$S_T - \frac{\rho}{T}S_\rho < 0\ and\ |(\nu\kappa' k^4 + \Gamma'\beta')E| > \Gamma\left(\beta + \frac{g}{C_P}\right)\kappa' k^2\ , \qquad (22)$$

The constant term in relation (20) is negative. Equation (20), therefore, involves one change of sign and hence contains one positive real root. The occurrence of positive root implies monotonic instability.

We thus obtain a criterion that a stellar atmosphere in the presence of stable solute concentration gradient and radiative transfer effect is unstable if

$$S_T - \frac{\rho}{T}S_\rho < 0 \; and \; |(\nu\kappa' k^4 + \Gamma'\beta')E| > \Gamma\left(\beta + \frac{g}{C_P}\right)\kappa' k^2 \; , \quad (23)$$

Hence the result.

Further Extension-1: The rotation induces a component of vorticity in the direction of rotation. The effects of radiative transfer arise when self-absorption is not negligible. It may be of some interest to examine the influence of radiative transfer and rotation on thermosolutal-convective instability of a stellar atmosphere.

Theorem 2: The criterion for monotonic instability (22) also holds good in the presence of radiative transfer and rotation effects on thermosolutal-convective instability in Stern's type configuration in a stellar atmosphere.

Proof: Here we consider an infinite horizontal fluid layer heated from above and solute concentrated from below and acted on by a uniform rotation $\vec{\Omega}(0,0,\Omega)$ and gravity force $\vec{g}(0,0,-g)$. The linearized perturbed equations of motion become

$$\frac{\partial \vec{v}}{\partial t} = -\frac{1}{\rho_0}\nabla\delta p + \nu\nabla^2\vec{v} - \vec{g}(\alpha\theta - \alpha'\gamma) + 2\left(\vec{v}\times\vec{\Omega}\right), \quad (24)$$

Equations (9), (10) and (14) remain unaltered.

Equations (9), (10), (14) and (24) give

$$\frac{\partial}{\partial t}(\nabla^2 w) = g\left(\frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2}\right)(\alpha\theta - \alpha'\gamma) + \nu\nabla^4 w - 2\Omega\frac{\partial\zeta}{\partial z} \; , \quad (25)$$

$$\frac{\partial\zeta}{\partial t} - \nu\nabla^2\zeta = 2\Omega\frac{\partial w}{\partial z} \; , \quad (26)$$

where

$$\zeta = \frac{\partial v}{\partial z} - \frac{\partial u}{\partial y}$$

denotes the z-component of vorticity, Equations (17) and (18) remain the same. Eliminating θ , ζ and γ from equations (17), (18), (25) and (26) and using expression (15), we obtain the dispersion relation

$$\begin{aligned} &n^4 + [E + k^2(2\nu + \kappa')]n^3 \\ &+ \left[\nu\kappa' k^4 + \Gamma'\beta' + Ek^2(\nu + \kappa') + \Gamma\left(\beta + \frac{g}{C_P}\right)\right. \\ &\left. + \nu k^2(E + k^2\overline{\nu + \kappa'}) + \frac{4\Omega^2 k_z^2}{k^2}\right]n^2 \\ &+ \left[(\nu\kappa' k^4 + \Gamma'\beta')E + \Gamma\left(\beta + \frac{g}{C_P}\right)k^2(\nu + \kappa')\right. \\ &+ \nu k^2\{\nu\kappa' k^4 + \Gamma'\beta' + k^2 E(\nu + \kappa')\} \\ &\left. + \frac{4\Omega^2 k_z^2}{k^2}(E + \kappa' k^2)\right]n \\ &+ \left[\nu k^2\left\{(\nu\kappa' k^4 + \Gamma'\beta')E + \kappa' k^2\Gamma\left(\beta + \frac{g}{C_P}\right)\right\}\right. \\ &\left. + 4\Omega^2 k_z^2\kappa' E\right] = 0. \end{aligned} \quad (27)$$

When (22) is satisfied, the constant term in equation (27) is negative. The product of the roots must be negative. Therefore at least one root of equation (27) is positive and one root is negative. The occurrence of positive root implies monotonic instability. The criterion for monotonic instability thus holds good in the presence of radiative transfer and rotation effects on thermosolutal-convective instability in a stellar atmosphere.

Further Extension-2: Further we study the effect of collisions on thermosolutal-convective instability of a composite medium. Quite frequently it happens that the plasma is not fully ionized and may instead be permeated with neutral atoms. The plasma may be idealized, therefore, following Hans [6], as a composite mixture of a hydromagnetic (ionized) component and a neutral component, the two interacting through mutual collisional (frictional) effects. A partially ionized plasma represents a

state which often exists in the universe. Hence it is of interest to investigate the influence of these frictional effects with neutrals on thermosolutal-convective instability of a composite medium.

Here we consider an infinite horizontal composite layer consisting of a finitely conducting hydromagnetic fluid of density ρ and a neutral gas of density ρ_d, acted on by a uniform vertical magnetic field $\vec{H}(0,0,H)$ and gravity force $\vec{g}(0,0,-g)$. This layer is heated from above and solute concentrated from below such that a steady temperature gradient $\beta\left(=dT/_{dz}\right)$ and a concentration gradient $\beta'\left(=-dC/_{dz}\right)$ are maintained. Regarding the model under consideration we observe that the number density of neutral particles is extremely smaller than the number density of ionized particles (Tanenbaum [12]). The pressure and buoyancy effects acting on neutral particles, therefore, have negligible influence (the volume fraction of the neutral particles being extremely small) whereas they are significant in the case of ionized component. In a partially ionized gas the magnetic field interacts with the charged component and is not directly affected by the neutral component (Parker [13]).

Now we prove the following Theorem :

Theorem 3: A criterion that the thermosolutal-convective instability of a composite stellar atmosphere in the presence of stable solute concentration gradient and collisional effects is unstable if

$$D < 0 \ and \ |(\nu\kappa' k^4 + \Gamma'\beta')D| > \Gamma\left(\beta + \frac{g}{C_P}\right)\kappa' k^2.$$

Proof: Let $\vec{h}(h_x, h_y, h_z)$, η, $\overrightarrow{v_d}$ and ν_C denote respectively the perturbation in magnetic field $\vec{H}$, the resistivity, the velocity of the neutral gas and the collision frequency between the two components of the composite medium. Then the linearized perturbation equations appropriate to the problem are

$$\frac{\partial \vec{v}}{\partial t} = -\frac{1}{\rho_0}\nabla\delta p + \nu\nabla^2\vec{v} + \frac{1}{4\pi\rho_0}\left(\nabla\times\vec{h}\right)\times\vec{H} + \vec{g}\frac{\delta\rho}{\rho_0} + \frac{\rho_d\nu_C}{\rho_0}(\overrightarrow{v_d} - \vec{v}), \quad (28)$$

$$\frac{\partial \overrightarrow{v_d}}{\partial t} = -\nu_C(\overrightarrow{v_d} - \vec{v}), \quad (29)$$

$$\frac{\partial \vec{h}}{\partial t} = \nabla\times\left(\vec{v}\times\vec{H}\right) + \eta\nabla^2\vec{h}, \quad (30)$$

$$\nabla.\vec{h} = 0, \quad (31)$$

together with equations (7), (9), (10) and (12). Equations (7), (9), (10), (12) and (28)-(31) give

$$\frac{\partial}{\partial t}\left(1 + \frac{\alpha_0\nu_C}{\frac{\partial}{\partial t} + \nu_C}\right)(\nabla^2 w) = g\left(\frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2}\right)(\alpha\theta - \alpha'\gamma) + \nu\nabla^4 w + \frac{H}{4\pi\rho_0}\nabla^2\frac{\partial h_z}{\partial z}, \quad (32)$$

$$\left(\frac{\partial}{\partial t} - \eta\nabla^2\right)h_z = H\frac{\partial w}{\partial z}, \quad (33)$$

$$\left(\frac{\partial}{\partial t} + D\right)\theta = -\left(\beta + \frac{g}{C_P}\right)w, \quad (34)$$

$$\left(\frac{\partial}{\partial t} - \kappa'\nabla^2\right)\gamma = \beta' w, \quad (35)$$

where $\alpha_0 = \rho_d/\rho_0$

Eliminating θ, γ and h_z from equations (32)-(35) and using expression (15), we obtain the dispersion relation

$$n^5 + A_4 n^4 + A_3 n^3 + A_2 n^2 + A_1 n + A_0 = 0, \quad (36)$$

where

$$A_4 = D + \nu_C(\alpha_0 + 1) + k^2(\nu + \eta + \kappa')$$

$$A_3 = \kappa'\eta k^4 + k^2 D(\eta + \kappa') + (\nu_C + \nu k^2 + \alpha_0 \nu_C)\{D + k^2(\eta + \kappa')\} + \nu k^2 \nu_C + \Gamma\left(\beta + \frac{g}{C_P}\right) + \Gamma'\beta' + k_z^2 V_A^2,$$

$$A_2 = \kappa'\eta k^4 D + (\nu_C + \nu k^2 + \alpha_0 \nu_C)\{\kappa'\eta k^4 + k^2 D(\eta + \kappa')\} + \nu k^2 \nu_C\{D + k^2(\eta + \kappa')\} + \Gamma\left(\beta + \frac{g}{C_P}\right)(\nu_C + \eta k^2 + \kappa' k^2) + \Gamma'\beta'(\nu_C + \eta k^2 + D) + k_z^2 V_A^2(\nu_C + \kappa' k^2 + D),$$

$$A_1 = \kappa'\eta k^4 D(\nu_C + \nu k^2 + \alpha_0 \nu_C) + \nu k^2 \nu_C\{\kappa'\eta k^4 + k^2 D(\eta + \kappa')\} + \Gamma\left(\beta + \frac{g}{C_P}\right)\{\eta k^2 \nu_C + \kappa' k^2(\nu_C + \eta k^2)\} + \Gamma'\beta'\{\eta k^2 \nu_C + D(\nu_C + \eta k^2)\} + k_z^2 V_A^2\{\kappa' k^2 \nu_C + D(\nu_C + \kappa' k^2)\},$$

$$A_0 = \eta k^2 \nu_C\left\{(\nu\kappa' k^4 + \Gamma'\beta')D + \Gamma\left(\beta + \frac{g}{C_P}\right)\kappa' k^2\right\} + k_z^2 V_A^2 D\kappa' k^2 \nu_C, \quad (37)$$

where

$$V_A^2 = \frac{H^2}{4\pi\rho_0}.$$

When

$$D < 0 \ \ and \ |(\nu\kappa' k^4 + \Gamma'\beta')D| > \Gamma\left(\beta + \frac{g}{C_P}\right)\kappa' k^2, \quad (38)$$

the constant term in equation (36) is negative. Equation (36), therefore, involves one change of sign and hence contains one positive real root. The occurrence of positive root implies monotonic instability.

We thus obtain a criterion that the thermosolutal-convective instability of a composite stellar atmosphere in the presence of stable solute concentration gradient and collisional effects is unstable if

$$D < 0 \ \ and \ |(\nu\kappa' k^4 + \Gamma'\beta')D| > \Gamma\left(\beta + \frac{g}{C_P}\right)\kappa' k^2.$$

The criterion for monotonic instability is the same in the presence or absence (Sharma and Sharma [14]) of the collisional effect on thermosolutal-convective instability of a composite stellar atmosphere.

Abstract: The effect of finite Larmor radius of the ions on thermal convection of a plasma is investigated. The case with vertical magnetic field is discussed. Following linear stability theory and normal mode analysis method, the dispersion relation is obtained. It is found that the presence of finite Larmor radius and magnetic field introduces oscillatory modes in the system which were, otherwise, non-existent in their absence. When the instability sets in as stationary convection, finite Larmor radius is found to have a stabilizing effect. Medium permeability has a destabilizing (or stabilizing) effect and the magnetic field has a stabilizing (or destabilizing) effect under certain conditions in the presence of finite Larmor radius effect whereas in the absence of finite Larmor radius effect, the medium permeability and the magnetic field have destabilizing and stabilizing effects, respectively. The sufficient conditions for the non-existence of overstability are also obtained.

Key-words: Finite Larmor radius effect, plasma, porous medium, thermal convection, vertical magnetic field

Received: February 19, 2021. Revised: August 5, 2021. Accepted: August 17, 2021. Published: August 31, 2021.

1 Introduction

The theoretical and experimental results on thermal convection in a fluid layer, under varying assumptions of hydrodynamics and hydromagnetics, have been discussed in a treatise by Chandrasekhar [1]. The effects of the finiteness of the ion Larmor radius which exhibits itself in the form of 'magnetic viscosity' in the fluid equations have been studied by many authors (Jukes [2]; Vandakurov [3]]) Sharma and Prakash [4] have studied the effect of finite Larmor radius on the thermal instability of a plasma. Melchior and Popowich [5] have considered the finite Larmor radius effect on the Kelvin-Helmholtz instability in a fully ionized plasma while that on Rayleigh-Taylor instability has been studied by Singh and Hans [6]. The effect of finite Larmor radius on the thermal instability of a plasma in the presence of a vertical magnetic field has been studied by Sharma [7].

The study of the breakdown of the stability of a layer of fluid subject to a vertical temperature gradient in porous medium and the possibility of convective flow is of considerable interest in recent years. The study of onset of convection in a porous medium has attracted considerable interest because of its natural occurrence and of its intrinsic importance in many industrial problems, particularly in petroleum-exploration, chemical and nuclear industries. The derivation of the basic equations of a layer of fluid heated from below in porous medium, using Boussinesq approximation, has been given by Joseph [8]. The study of a layer of fluid heated from below in porous media is motivated both theoretically and by its practical applications in engineering disciplines. Among the applications in engineering disciplines one can find the food process industry, chemical process industry, solidification and centrifugal casting of metals. The development of geothermal power resources has increased general interest in the properties of convection in porous medium. Lapwood [9] has studied the stability of convective flow in a porous medium

using Rayleigh's procedure. The Rayleigh instability of a thermal boundary layer in flow through a porous medium has been considered by Wooding [10].

The properties of ionized space and laboratory magnetic fluids (plasmas) have been intensively investigated theoretically and experimentally in the past sixty years. One of the key aspects studied in this context is the stability of plasma structures. Usually, instabilities can be divided into two categories: macro- and micro-instabilities. Macro-instabilities occur with low frequencies compared to the plasma and cyclotron frequency and they are studied within the framework of magnetohydrodynamics (MHD). Physicists have understood the behavior of macro-instabilities and they showed how to avoid the most destructive of them, but small-scale gradient driven micro-instabilities are still a serious obstacle for having a stable plasma for a large range of parameters. Micro-instabilities are described by models which include, e.g. finite Larmor radius (FLR) and collisionless dissipative effects in plasmas. Time and length scales of micro-instabilities are comparable to the turbulent length scales and the length scales of transport coefficients. In general, the FLR effect is neglected. However, when the Larmor radius becomes comparable to the hydromagnetic length of the problem (e.g. wavelength) or the gyration frequency of ions in the magnetic field is of the same order as the wave frequency, finiteness of the Larmor radius must be taken into account. Strictly speaking, the space and time scale for the breakdown of hydromagnetics are on the respective scales of ion gyration about the field, and the ion Larmor frequency. In the present paper, we explore the effect of FLR on the thermal instability of a plasma in porous medium. Finite Larmor radius effect on plasma instabilities has been the subject of many investigations. In many astrophysical plasma situations such as in solar corona, interstellar and interplanetary plasmas the assumption of zero Larmor radius is not valid. Roberts and Taylor [11] and Rosenbluth et al. [12] have shown the stabilizing influence of finite ion Larmor radius (FLR) effects on plasma instabilities. Hernegger [13] investigated the stabilizing effect of FLR on thermal instability and showed that thermal criterion is changed by FLR for wave propagation perpendicular to the magnetic field. Sharma [14] investigated the stabilizing effect of FLR on thermal instability of rotating plasma. Ariel [15] discussed the stabilizing effect of FLR on thermal instability of conducting plasma layer of finite thickness surrounded by a non-conducting matter. Vaghela and Chhajlani [16] studied the stabilizing effect of FLR on magneto-thermal stability of resistive plasma through a porous medium with thermal conduction. Bhatia and Chhonkar [17] investigated the stabilizing effect of FLR on the instability of a rotating layer of self-gravitating plasma incorporating the effects of viscosity and Hall current. Vyas and Chhajlani [18] pointed out the stabilizing effect of FLR on the thermal instability of magnetized rotating plasma incorporating the effects of viscosity, finite electrical conductivity, porosity and thermal conductivity. Kaothekar and Chhajlani [19] investigated the problem of Jeans instability of self-gravitating rotating radiative plasma with finite Larmor radius corrections. Thus FLR effect is an important factor in the discussion of thermal convection and other hydromagnetic instabilities. Keeping these in mind, an attempt is made to study the thermal convection of incompressible plasma in porous medium in the presence of finite Larmor radius effect in the present paper.

2 Formulation of the Problem and Perturbation Equations

Consider an infinite, horizontal, incompressible, viscous and electrically conducting plasma layer of depth d bounded by the planes $z = 0$ and $z = d$ in an isotropic and homogeneous medium of porosity ε and medium permeability k_1. This layer is heated from below such that a steady temperature gradient $\beta(= \left|{}^{dT}/_{dz}\right|)$ is maintained. Temperatures and densities at the bottom surface $z = 0$ are T_0 and ρ_0 and at the upper surface $z = d$ are T_1 and ρ_1 respectively. The system is acted on by a uniform vertical magnetic field $\vec{H}(0, 0, H)$ and gravity field $\vec{g}(0, 0, -g)$. Let $\rho, T, \alpha, \chi, g, \mu_e, \mu, \nu \left(= \frac{\mu}{\rho_0}\right), (u, v, w), \eta$ and $\vec{P}$ denote, respectively, the density, temperature, thermal coefficient of expansion, thermal diffusivity, gravitational

acceleration, magnetic permeability, viscosity, kinematic viscosity, electrical resistivity and stress tensor taking into account the finite Larmor radius effect. When the plasma flows through a porous medium, the gross effect is represented by Darcy's law. As a result, the resistance term $-\left(\frac{\mu}{k_1}\right)\vec{q}$ replaces the usual viscous term, here $\vec{q}$ stands for the filter velocity of the plasma. Then the equations expressing the conservation of momentum, mass and heat are

$$\frac{1}{\varepsilon}\left[\frac{\partial \vec{q}}{\partial t}+\frac{1}{\varepsilon}(\vec{q}.\nabla)\vec{q}\right]=-\frac{1}{\rho_0}\vec{P}+\vec{g}\left(1+\frac{\delta\rho}{\rho_0}\right)+\frac{\mu_e}{4\pi\rho_0}(\nabla\times\vec{\mathrm{H}})\times\vec{H}-\frac{\nu}{k_1}\vec{q}\,, \quad (1)$$

$$\nabla.\vec{q}=0\,, \quad (2)$$

$$E\frac{\partial T}{\partial t}+(\vec{q}.\nabla)T=\kappa\nabla^2 T, \quad (3)$$

where $E=\varepsilon+(1-\varepsilon)\frac{\rho_s C_s}{\rho_0 C}$s ; ρ_0, C are the density and heat capacity of the plasma and ρ_s, C_s are the density and the heat capacity of the solid matrix respectively.

The equation of the state is

$$\rho=\rho_0[1-\alpha(T-T_0)],$$

where the suffix zero refers to the values at the reference level $z=0$.

The Maxwell's equations yield

$$\varepsilon\frac{d\vec{H}}{dt}=(\vec{H}.\nabla)\vec{q}+\epsilon\eta\nabla^2\vec{H}\,, \quad (4)$$

$$\nabla.\vec{H}=0\,, \quad (5)$$

where $d/dt=\partial/\partial t+(1/\varepsilon)(\vec{q}.\nabla)$ stands for the convective derivative.

For the magnetic field along the $z-$axis, the stress tensor $\vec{\vec{P}}$, taking into account the finite ion gyration radius (Vandakurov, [3]), has the components

$$P_{xx}=p-\rho_0\nu_0\left(\frac{\partial u}{\partial y}+\frac{\partial v}{\partial x}\right),$$

$$P_{xy}=P_{yx}=\rho_0\nu_0\left(\frac{\partial u}{\partial x}-\frac{\partial v}{\partial y}\right),$$

$$P_{xz}=P_{zx}=-2\rho_0\nu_0\left(\frac{\partial v}{\partial z}+\frac{\partial w}{\partial y}\right), \quad (6)$$

$$P_{yy}=p+\rho_0\nu_0\left(\frac{\partial u}{\partial y}+\frac{\partial v}{\partial x}\right),$$

$$P_{yz}=P_{zy}=2\rho_0\nu_0\left(\frac{\partial w}{\partial x}+\frac{\partial u}{\partial z}\right), \quad P_{zz}=p\,,$$

where p is the scalar part of the pressure and $\rho_0\nu_0=Nk^*T/4\omega_H$, ω_H being the ion-gyration frequency, k^* is Boltzman constant, while N and T are number density and temperature of the ions, respectively.

The steady state solution is

$$\vec{q}=(0,\,0,\,0), T=T_0-\beta z, \quad \rho=\rho_0(1+\alpha\beta z), \quad (7)$$

where $\beta=\frac{T_0-T_1}{d}$ is the magnitude of uniform temperature gradient which is maintained and is positive as temperature decreases upwards.

Now we consider a small perturbation on the steady state and let $\delta\rho,\delta\vec{\vec{P}},\theta,\vec{q}(u,\,v,w)$ and $\vec{h}(h_x,\,h_y,\,h_z)$ denote, respectively, the perturbations in density, stress tensor, temperature, hydromagnetic fluid velocity (initially zero) and the magnetic field. The change in density $\delta\rho$, caused by the perturbations θ in temperature, is given by

$$\delta\rho=-\alpha\rho_0\theta\,. \quad (8)$$

Then the linearized hydromagnetic perturbation equations relevant to the problem are

$$\frac{1}{\varepsilon}\frac{\partial\vec{q}}{\partial t}=-\frac{1}{\rho_0}\nabla\delta\vec{\vec{P}}+\vec{g}\left(\frac{\delta\rho}{\rho_0}\right)+\frac{\mu_e}{4\pi\rho_0}(\nabla\times\vec{h})\times\vec{H}-\frac{\nu}{k_1}\vec{q}\,, \quad (9)$$

$$\nabla.\vec{q}=0\,, \quad (10)$$

$$E\frac{\partial\theta}{\partial t}=\beta w+\kappa\nabla^2\theta\,, \quad (11)$$

$$\varepsilon\frac{\partial\vec{h}}{\partial t}=(\vec{H}.\nabla)\vec{q}+\epsilon\eta\nabla^2\vec{h}\,, \quad (12)$$

$$\nabla.\vec{h}=0. \quad (13)$$

Within the framework of the Boussinesq approximation, equations (9) – (13) become

$$\left(\frac{\partial}{\partial t}+\frac{\nu\varepsilon}{k_1}\right)\nabla^2 = \varepsilon g\alpha\left(\frac{\partial^2}{\partial x^2}+\frac{\partial^2}{\partial y^2}\right)\theta + \frac{\mu_e H\varepsilon}{4\pi\rho_0}\frac{\partial}{\partial z}(\nabla^2 h_z) + \varepsilon\nu_0\left(\nabla^2 - 3\frac{\partial^2}{\partial z^2}\right)\frac{\partial\zeta}{\partial z}, \quad (14)$$

$$\left(\frac{\partial}{\partial t}+\frac{\nu\varepsilon}{k_1}\right)\zeta = \frac{\mu_e\varepsilon H}{4\pi\rho_0}\frac{\partial\xi}{\partial z} - \varepsilon\nu_0\left(\nabla^2 - 3\frac{\partial^2}{\partial z^2}\right)\frac{\partial w}{\partial z}, \quad (15)$$

$$\varepsilon\frac{\partial\xi}{\partial t} = H\frac{\partial\zeta}{\partial z} + \varepsilon\eta\nabla^2\xi, \quad (16)$$

$$\left[E\frac{\partial}{\partial t} - \kappa\nabla^2\right]\theta = \beta w, \quad (17)$$

$$\varepsilon\left[\frac{\partial}{\partial t} - \eta\nabla^2\right]h_z = H\frac{\partial w}{\partial z}, \quad (18)$$

where $\nabla^2 = {\partial^2}/{\partial x^2} + {\partial^2}/{\partial y^2} + {\partial^2}/{\partial z^2}$

and $\zeta = {\partial v}/{\partial x} - {\partial u}/{\partial y};\ \xi = {\partial h_y}/{\partial x} - {\partial h_x}/{\partial y}$

stand for the z-components of vorticity and current density, respectively.

3 Dispersion Relation

We decompose the disturbances into normal modes and assume that the perturbed quantities are of the form

$$[w, h_z, \zeta, \xi, \theta] = [W(z), K(z), Z(z), X(z), \Theta(z)]exp\left[ik_x x + ik_y y + nt\right], \quad (19)$$

where k_x and k_y are the wave numbers along the $x-$ and $y-$ directions, respectively, $k = \sqrt{k_x^2 + k_y^2}$ is the resultant wave number, and n is, in general, a complex constant.

Using expression (19), equations (14) - (18) in non-dimensional form transform to

$$\left(\frac{\sigma}{\varepsilon}+\frac{1}{P_l}\right)(D^2-a^2)W + \left(\frac{gd^2}{\nu}\right)a^2\alpha\Theta - \frac{\mu_e H d}{4\pi\rho_0\nu}(D^2-a^2)DK + \left(\frac{\nu_0 d}{\nu}\right)(2D^2+a^2)DZ = 0, \quad (20)$$

$$\left(\frac{\sigma}{\varepsilon}+\frac{1}{P_l}\right)Z = \left(\frac{\mu_e H d}{4\pi\rho_0\nu}\right)DX + \left(\frac{\nu_0}{\nu d}\right)(2D^2+a^2)DW, \quad (21)$$

$$[D^2 - a^2 - Ep_1\sigma]\Theta = -\left(\frac{\beta d^2}{\kappa}\right)W, \quad (22)$$

$$[D^2 - a^2 - p_2\sigma]K = -\left(\frac{Hd}{\varepsilon\eta}\right)DW, \quad (23)$$

$$[D^2 - a^2 - p_2\sigma]X = -\left(\frac{Hd}{\varepsilon\eta}\right)DZ, \quad (24)$$

where we have introduced new coordinates $(x^*, y^*, z^*) = \left({x}/{d}, {y}/{d}, {z}/{d}\right)$ in the new unit of length d and $D = {d}/{dz^*}$. For convenience, the asterisks are dropped hereafter. Also we have put $a = kd$ and $\sigma = {nd^2}/{\nu}$, $p_1 = {\nu}/{\kappa}$ is the Prandtl number, $p_2 = {\nu}/{\eta}$ is the magnetic Prandtl number and $P_l = {k_1}/{d^2}$ is the dimensionless medium permeability.

Here we consider the case where both boundaries are free as well as perfect conductors of heat, while the adjoining medium is electrically non-conducting. The case of two free boundaries is slightly artificial, except in stellar atmospheres (Spiegel [20]) and in certain geophysical situations where it is most appropriate. However, the case of two free boundaries allows us to obtain analytical solution without affecting the essential features of the problem. The appropriate boundary conditions, with respect to which equations (20) – (24) must be solved, are

$$W = D^2W = 0,\ DZ = 0, \Theta = 0, X = 0 = 0\ \ at\ z = 0\ and\ 1, \quad (25)$$

on a perfectly conducting boundary.

In the absence of any surface current, the tangential components of the magnetic field are continuous. Hence the boundary conditions, in addition to (25), are

$DK = 0$ on the boundaries. (26)

Using the above boundary conditions, it can be shown that all the even order derivatives of W must vanish for $z = 0\ and\ 1$ and hence the proper solution of W characterizing the lowest mode is

$$W = W_0 sin\, \pi z, \tag{27}$$

where W_0 is a constant.

Eliminating $Z, K, X\ and\ \Theta$ between equations (20) - (24) and substituting the proper solution (27) in the resultant equation, we obtain the dispersion relation

$$\begin{aligned} &R_1 x \\ &= (1+x)\left(\frac{i\sigma_1}{\varepsilon}+\frac{1}{P}\right)(1+x+iEp_1\sigma_1) \\ &+ Q_1\frac{(1+x)(1+x+iEp_1\sigma_1)}{\varepsilon(1+x+ip_2\sigma_1)} \\ &+\frac{U(x-2)^2(1+x+ip_2\sigma_1)(1+x+iEp_1\sigma_1)}{\left[(1+x+ip_2\sigma_1)\left(\frac{i\sigma_1}{\varepsilon}+\frac{1}{P}\right)+\frac{Q_1}{\varepsilon}\right]}, \end{aligned} \tag{28}$$

where

$$Q = \frac{\mu_e H^2 d^2}{4\pi\rho_0\nu\eta}, R = \frac{g\alpha\beta d^4}{\nu\kappa}\ ,\ U = \frac{\nu_0^2}{\nu^2},$$

stand for the Chandrasekhar number, the thermal Rayleigh number, a non-dimensional number accounting for the finite Larmor radius, respectively, and we have also put

$$x = \frac{a^2}{\pi^2},\ P = \pi^2 P_l,\ i\sigma_1 = \frac{\sigma}{\pi^2},\ Q_1 = \frac{Q}{\pi^2},\ R_1 = \frac{R}{\pi^4}\ \ and\ i\ \ = \sqrt{-1}\,.$$

4 Important Theorems and Discussion

Theorem 1: The system is stable or unstable.

Proof: Multiplying equation (20) by W^*, the complex conjugate of W, and using equations (21) - (24) together with the boundary conditions (25) and (26), we obtain

$$\begin{aligned} &\left(\frac{\sigma}{\varepsilon}+\frac{1}{P_l}\right)I_1 - \frac{g\alpha\kappa a^2}{\nu\beta}(I_2 + Ep_1\sigma^* I_3) \\ &+\frac{\mu_e\eta\varepsilon}{4\pi\rho_0\nu}(I_4 + p_2\sigma^* I_5) + d^2\left(\frac{\sigma^*}{\varepsilon}+\frac{1}{P_l}\right)I_6 \\ &+\frac{\mu_e\eta d^2\varepsilon}{4\pi\rho_0\nu}(I_7 + p_2\sigma I_8) \\ &= 0\,, \end{aligned} \tag{29}$$

where

$$I_1 = \int_0^1 (|DW|^2 + a^2|W|^2)\, dz,$$

$$I_2 = \int_0^1 (|D\Theta|^2 + a^2|\Theta|^2) dz,$$

$$I_3 = \int_0^1 (|\Theta|^2) dz,$$

$$I_4 = \int_0^1 (|D^2K|^2 + 2a^2|DK|^2 + a^4|K|^2) dz,$$

$$I_5 = \int_0^1 (|DK|^2 + a^2|K|^2) dz,$$

$$I_6 = \int_0^1 (|Z|^2) dz,$$

$$I_7 = \int_0^1 (|DX|^2 + a^2|X|^2) dz,$$

$$I_8 = \int_0^1 (|X|^2) dz. \tag{30}$$

and σ^* is the complex conjugate of σ. The integrals $I_1, \ldots\ldots\ldots\ldots I_8$ are all positive definite. Putting $\sigma = \sigma_r + i\sigma_i$ and equating the real and imaginary parts of equation (29), we obtain

$$\begin{aligned} &\left[\frac{I_1}{\varepsilon}+\frac{\mu_e\eta\varepsilon p_2}{4\pi\rho_0\nu}(I_5 + d^2 I_8) - \frac{g\alpha\kappa a^2}{\nu\beta}Ep_1 I_3 + \frac{d^2}{\varepsilon}I_6\right]\sigma_r = \\ &-\left[\frac{1}{P_l}I_1 + \frac{\mu_e\eta\varepsilon}{4\pi\rho_0\nu}(I_4 + d^2 I_7) - \frac{g\alpha\kappa a^2}{\nu\beta}I_2 + \frac{d^2}{P_l}I_6\right], \end{aligned} \tag{31}$$

and

$$\left[\frac{I_1}{\varepsilon}+\frac{g\alpha\kappa a^2}{\nu\beta}Ep_1I_3-\frac{\mu_e\eta\varepsilon p_2}{4\pi\rho_0\nu}(I_5-d^2I_8)-\frac{d^2}{\varepsilon}I_6\right]\sigma_i=0\,. \quad (32)$$

It is evident from equation (31) that σ_r may be positive or negative. The system is, therefore, stable or unstable.

Theorem 2: The modes may be oscillatory or non-oscillatory in contrast to case of no magnetic field, and in the absence of finite Larmor radius and stable solute gradient where modes are non-oscillatory.

Proof: Equation (32) yields that σ_i may be zero or non-zero, which means that the modes may be non-oscillatory or oscillatory. In the absence of finite Larmor radius and magnetic field, equation (32) reduces to

$$\sigma_i\left[\frac{I_1}{\varepsilon}+\frac{g\alpha\kappa a^2}{\nu\beta}Ep_1I_3\right]=0, \quad (33)$$

and the terms in brackets are positive definite. Thus $\sigma_i=0$, which means that oscillatory modes are not allowed and the principle of exchange of stabilities is valid. The oscillatory modes are introduced due to the presence of magnetic field and finite Larmor radius which were non-existent in their absence.

Theorem 3: The system is stable for $\frac{g\alpha\kappa}{\nu\beta}\leq\frac{27\pi^4}{4}$ and under the condition $\frac{g\alpha\kappa}{\nu\beta}>\frac{27\pi^4}{4}$, the system becomes unstable.

Proof: From equation (32), it is clear that σ_i is zero when the quantity multiplying it is not zero and arbitrary when this quantity is zero.

If $\sigma_i\neq 0$, then equation (31) gives

$$\frac{I_1}{\varepsilon}+\frac{\mu_e\eta d^2\varepsilon}{4\pi\rho_0\nu}p_2I_8=\frac{\mu_e\eta\varepsilon}{4\pi\rho_0\nu}p_2I_5+\frac{d^2}{\varepsilon}I_6-\frac{g\alpha\kappa a^2}{\nu\beta}Ep_1I_3$$

Substituting this in equation (30), we get

$$\frac{2\sigma_rI_1}{\varepsilon}+\frac{1}{P_l}I_1+\frac{\mu_e\eta\varepsilon}{4\pi\rho_0\nu}I_4+d^2\left(\frac{1}{P_l}\right)I_6+\frac{\mu_e\eta d^2\varepsilon}{4\pi\rho_0\nu}I_7+\frac{2\sigma_r\mu_e\eta d^2\varepsilon}{4\pi\rho_0\nu}p_2I_8=\frac{g\alpha\kappa a^2}{\nu\beta}I_2\,. \quad (34)$$

Equation (34) on using Rayleigh-Ritz inequality gives

$$\frac{(\pi^2+a^2)^3}{a^2}\int_0^1|W|^2\,dz+\frac{(\pi^2+a^2)}{a^2}\left\{\frac{2\sigma_r\mu_e\eta d^2\varepsilon}{4\pi\rho_0\nu}p_2I_8+\frac{\mu_e\eta d^2\varepsilon}{4\pi\rho_0\nu}I_7+d^2\left(\frac{1}{P_l}\right)I_6+\frac{\mu_e\eta\varepsilon}{4\pi\rho_0\nu}I_4+\frac{1}{P_;}I_1+\frac{2\sigma_r}{\varepsilon}I_1\right\}\leq\frac{g\alpha\kappa}{\beta\nu}\int_0^1|W|^2\,dz\ . \quad (35)$$

Therefore, it follows from equation (35) that

$$\left[\frac{27\pi^4}{4}-\frac{g\alpha\kappa}{\nu\beta}\right]\int_0^1|W|^2\,dz+\frac{(\pi^2+a^2)}{a^2}\left\{\frac{2\sigma_r\mu_e\eta d^2\varepsilon}{4\pi\rho_0\nu}p_2I_8+\frac{\mu_e\eta d^2\varepsilon}{4\pi\rho_0\nu}I_7+d^2\left(\frac{1}{P_l}\right)I_6+\frac{\mu_e\eta\varepsilon}{4\pi\rho_0\nu}I_4+\frac{1}{P_;}I_1+\frac{2\sigma_r}{\varepsilon}I_1\right\}\leq 0 \quad (36)$$

since minimum value of $\frac{(\pi^2+a^2)^3}{a^2}$ with respect to a^2 is $\frac{27\pi^4}{4}$.

Now, let $\sigma_r\geq 0$, we necessary have from (36) that

$$\frac{g\alpha\kappa}{\nu\beta}>\frac{27\pi^4}{4}\quad . \quad (37)$$

Hence, if

$$\frac{g\alpha\kappa}{\nu\beta}\leq\frac{27\pi^4}{4}\quad , \quad (38)$$

then $\sigma_r<0$. Therefore, the system is stable. Thus, under condition (38), the system is stable and under condition (37) the system becomes unstable.

Theorem 4: For stationary convection case:

(I) Finite Larmor radius has stabilizing effects on the system.

(II) In the absence of finite Larmor radius effect, the medium permeability and the magnetic field have destabilizing and stabilizing effects respectively.

(III) In the presence of finite Larmor radius effect if

$$\left[\frac{1+x}{P}+\frac{Q_1}{\varepsilon}\right]^2 > (or\ <) \\ U(x-2)^2(1+x)$$

the medium permeability has a destabilizing (or stabilizing) and the magnetic field has a stabilizing (or destabilizing) effect on the system.

Proof: When the instability sets in as stationary convection, the marginal state will be characterized by $\sigma = 0$. Putting $\sigma = 0$, the dispersion relation (28) reduces to

$$R_1 = \left(\frac{1+x}{x}\right)\left[\frac{1+x}{P}+\frac{Q_1}{\varepsilon}\right] + \frac{U(x-2)^2(1+x)^2}{x\left[\frac{1+x}{P}+\frac{Q_1}{\varepsilon}\right]}, \quad (39)$$

which expresses the modified Rayleigh number R_1 as a function of the dimensionless wave number x and the parameters $Q_1, U\ and\ P$. To study the effects of finite Larmor radius, medium permeability and magnetic field on R_1, we examine the nature of $dR_1/dU\ , dR_1/dP\ and\ dR_1/dQ_1$ analytically.

(I) It follows from equation (39),

$$\frac{dR_1}{dU} = \frac{(x-2)^2(1+x)^2}{x\left[\frac{1+x}{P}+\frac{Q_1}{\varepsilon}\right]} > 0, \quad (40)$$

which implies that finite Larmor radius has stabilizing effect on the system.

(II) Also equation (39) yields

$$\frac{dR_1}{dP} = -\frac{(1+x)}{xP^2}$$

$$\left[\frac{\left(\frac{1+x}{P}+\frac{Q_1}{\varepsilon}\right)^2 - U(x-2)^2}{\left(\frac{1+x}{P}+\frac{Q_1}{\varepsilon}\right)^2}\right], \quad (41)$$

and

$$\frac{dR_1}{dQ_1} = \left(\frac{1+x}{\varepsilon x}\right)$$

$$\left[\frac{\left(\frac{1+x}{P}+\frac{Q_1}{\varepsilon}\right)^2 - U(x-2)^2(1+x)}{\left(\frac{1+x}{P}+\frac{Q_1}{\varepsilon}\right)^2}\right], \quad (42)$$

If

$$\left[\frac{1+x}{P}+\frac{Q_1}{\varepsilon}\right]^2 < U(x-2)^2(1+x), \quad (43)$$

then

$$\frac{dR_1}{dP} > 0\ and\ \frac{dR_1}{dQ_1} < 0,$$

exhibiting the stabilizing effect of medium permeability and destabilizing effect of magnetic field respectively.

If

$$\left[\frac{1+x}{P}+\frac{Q_1}{\varepsilon}\right]^2 > U(x-2)^2(1+x), \quad (44)$$

then

$$\frac{dR_1}{dP} < 0\ and\ \frac{dR_1}{dQ_1} > 0,$$

meaning thereby the destabilizing effect of medium permeability and stabilizing effect of the magnetic field on the thermal instability of a plasma in porous media.

In the absence of finite Larmor radius effect, equation (41) reduces to

$$\frac{dR_1}{dP} = -\frac{(1+x)^2}{xP^2} < 0, \quad (45)$$

and

$$\frac{dR_1}{dQ_1} = \left(\frac{1+x}{\varepsilon x}\right) > 0. \quad (46)$$

The medium permeability and magnetic field thus have destabilizing and stabilizing effects respectively.

Theorem 5: The sufficient conditions for the non-existence of overstability are

$$\kappa < \left[\varepsilon + (1-\varepsilon)\frac{\rho_S C_S}{\rho_0 C}\right]\eta \ \ and\ \kappa < \frac{\left[\varepsilon + (1-\varepsilon)\frac{\rho_S C_S}{\rho_0 C}\right]\eta}{P^3\left[\left(\frac{\nu_0}{\nu}\right)^2 \varepsilon(b-3)^2 - \frac{\mu_e H^2 d^2}{2\varepsilon^2 \rho_0 \nu \eta \pi^3 P}\right]}.$$

Proof: Here we discuss the possibility of whether instability may occur as overstability. Since for overstability, our interest is to determine the critical Rayleigh number for the onset of instability via a state of pure oscillations, it will suffice to find conditions for which equation (28) will admit of solutions with σ_1 real.

Assuming that σ_1 is real and equating the real and imaginary parts of equation (28) and eliminating R_1 between them, we obtain

$$A_3 C_1^3 + A_2 C_1^2 + A_1 C_1 + A_0 = 0\,, \qquad (47)$$

where $C_1 = \sigma_1^2\,,\ b = 1 + x\ and$

$$A_3 = \frac{b p_2^4}{\varepsilon^2}\left(\frac{E p_1}{P} + \frac{b}{\varepsilon}\right), \qquad (48)$$

$$\begin{aligned} A_0 = \frac{b^6}{\varepsilon P^2} + \Bigg[&\left(\frac{E p_1}{P^3} + \frac{2Q_1}{\varepsilon^2 P}\right) - \frac{U(b-3)^2}{\varepsilon}\Bigg] b^5 \\ &+ \left[\frac{Q_1^2}{\varepsilon^3} + \frac{Q_1}{\varepsilon P^2}(3E p_1 - p_2) + U(b-3)^2 \frac{E p_1}{P}\right] b^4 \\ &+ \left[\frac{Q_1^2}{\varepsilon^2 P}(3E p_1 - 2p_2) + U(b-3)^2\left(\frac{p_2 Q_1}{\varepsilon} + \frac{E p_1 Q_1}{\varepsilon}\right)\right] b^3 \\ &+ \frac{Q_1^3}{\varepsilon^3}(E p_1 - p_2) b^2. \end{aligned} \qquad (49)$$

The coefficients $A_1 - A_2$ being quite lengthy and not needed in the discussion of overstability, have not been written here. Since σ_1 is real for overstability, the three values of $C_1 (= \sigma_1^2)$ are positive. The product of the roots of (47) is $-A_0/A_3$ and if this is to be positive, then A_0 must be negative since A_3 is positive.

It is clear from (49) that A_0 is always positive if

$$E p_1 > p_2\,, \quad and \quad \left(\frac{E p_1}{P^3} + \frac{2Q_1}{\varepsilon^2 P}\right) > \frac{U(b-3)^2}{\varepsilon}, \qquad (50)$$

which implies that

$$\kappa < \left[\varepsilon + (1-\varepsilon)\frac{\rho_S C_S}{\rho_0 C}\right]\eta \ \ and\ \kappa < \frac{\left[\varepsilon + (1-\varepsilon)\frac{\rho_S C_S}{\rho_0 C}\right]\eta}{P^3\left[\left(\frac{\nu_0}{\nu}\right)^2 \varepsilon(b-3)^2 - \frac{\mu_e H^2 d^2}{2\varepsilon^2 \rho_0 \nu \eta \pi^3 P}\right]} \qquad (51)$$

The inequalities (51) are, therefore, the sufficient conditions for the non-existence of overstability, the violation of which does not necessarily imply the occurrence of overstability.

5 Conclusions

The thermal convection of a plasma in porous medium in the presence of finite Larmor radius effect is considered in the present paper. The main conclusions from the analysis of this paper are as follows:

- It is found that the finite Larmor radius and magnetic field introduce oscillatory modes in the system which were non-existent in their absence.
- It is observed that the system is stable for $\frac{g\alpha\kappa}{\nu\beta} \le \frac{27\pi^4}{4}$ and under the condition $\frac{g\alpha\kappa}{\nu\beta} > \frac{27\pi^4}{4}$, the system becomes unstable.
- For the case of stationary convection, finite Larmor radius has stabilizing effect on the system.
- It is also observed for the case of stationary convection that in the presence of finite Larmor radius effect, the magnetic field has a stabilizing (or destabilizing) effect and the medium permeability has a destabilizing (or stabilizing) effect under certain conditions whereas in the absence of finite Larmor radius effect, the magnetic field and the medium

permeability have stabilizing and destabilizing effects, respectively.

- The case of overstability is also considered. The conditions

$$\kappa < \left[\varepsilon + (1-\varepsilon)\frac{\rho_S C_S}{\rho_0 C}\right]\eta \ \ and\ \kappa < \frac{\left[\varepsilon + (1-\varepsilon)\frac{\rho_S C_S}{\rho_0 C}\right]\eta}{P^3\left[\left(\frac{\nu_0}{\nu}\right)^2 \varepsilon(b-3)^2 - \frac{\mu_e H^2 d^2}{2\varepsilon^2 \rho_0 \nu \eta \pi^3 P}\right]}$$

are the sufficient conditions for the non-existence of overstability, the violation of which does not necessarily imply the occurrence of overstability.

Isolation and Idenficatiion of Vibrio Spp from Different Dye Industry Effluent in Salem Distric Tamilnadu

Authors : Dr. V. Kalaiselvi ; P. Umamagesh ; D. Ammu ; R. Latha

DOI : doi.org/10.47752/sjsr.310.129.132 (https://doi.org/10.47752/sjsr.310.129.132)

Abstract:

Studies were carried out on the Different type of vibrio spp, isolated from dye industry effluent. Among the 90 strains of vibrio spp isolated from effluents of textile industries, three showed optimize at different factors such as pH, Temperatue, salinity, carbone source, nitrogen source etc.

Effective Interfacial Tension Effect on Kelvin-Helmholtz Instability

Authors : Pardeep Kumar ; Hari Mohan

DOI : doi.org/10.47752/sjsr.310.122.128 (https://doi.org/10.47752/sjsr.310.122.128)

Abstract:

The instability of the plane interface between two uniform, superposed and streaming Walters' B' viscoelastic fluids through porous medium in the presence of effective interfacial tension is considered. The case of two uniform streaming fluids separated by a horizontal boundary is studied. It is observed, for the special case where the effective interfacial tension is ignored, that the system is stable or unstable for the potentially stable configuration which is in contrast to the case of Rivlin-Ericksen viscoelastic fluid or Newtonian fluid where the system is always stable for the potentially stable configuration. Moreover, if the perturbations in the direction of streaming are ignored, then the perturbations transverse to the direction of streaming are found to be unaffected by the presence of streaming, whereas for perturbations in all other directions there exists instability for a certain wave number range. 'Effective interfacial tension' is able to suppress this Kelvin-Helmholtz instability for small wavelength perturbations, the medium porosity reduces the stability range given in terms of a difference in streaming velocities.

Thermosolutal-convective Instability in Stern's Type Configuration

PARDEEP KUMAR[1,*] , HARI MOHAN[2]

[1,2]Department of Mathematics, ICDEOL, Himachal Pradesh University,

Summerhill, Shimla-171005, INDIA.

Abstract:- The thermal-convective instability of a stellar atmosphere in the presence of stable solute gradient in Stern's type configuration is studied in the presence of radiative transfer effect. A criterion for monotonic instability is obtained in terms of the source functions S. The criterion for monotonic instability is found to be unchanged in the presence of radiative transfer and rotation effects. The problem of thermosolutal-convective instability of a hydromagnetic composite medium is also studied to include the frictional effects with neutrals. The criterion derived for monotonic instability in terms of heat-loss function is found to be the same in the presence or absence of the collisional effects.

Key-Words:-Frictional effects, Thermosolutal-convective instability, Radiative transfer effect, Rotation,

Received: February 9, 2021. Revised: June 28, 2021. Accepted: July 10, 2021. Published: July 16, 2021.

1. Introduction

Defouw [1] has generalized the Schwarzschild criterion for convection to include departures from adiabatic motion and has shown that a thermally unstable atmosphere is also convectively unstable, irrespective of the atmospheric temperature gradient. The instability in which motions are driven by buoyancy forces of a thermally unstable atmosphere has been termed as "thermal convective instability". Defouw [1] has shown that an inviscid stellar atmosphere is unstable is unstable if

$$D = \frac{1}{C_P}\left(L_T - \rho\alpha L_\rho\right) + \kappa k^2 < 0, \qquad (1)$$

where L is the energy lost minus the energy gained per gram per second (the heat loss function) and ρ, α, κ, k, L_T, L_ρ denote respectively the density, the coefficient of thermal expansion, the coefficient of thermometric conductivity, the wave number of the perturbation, the partial derivative of L with respect to temperature T and the partial derivative of L with respect to density ρ, both evaluated in the equilibrium state. In general, the instability due to inequality (1) may be either oscillatory or monotonic. Defouw [1] has also shown that inequality (1) is a sufficient condition for monotonic instability in the presence of magnetic field and rotation on thermal convective instability.

Defouw [1] has also studied the effect of radiative transfer on the thermal-convective instability and has found that the source functions S which lead to thermal-convective instability are those for which $S_T - (\rho/T)S_\rho < 0$, the subscripts on S denote the partial derivatives of S with respect to T and ρ both evaluated in the equilibrium state.

A detailed account of thermal convection, under varying assumptions of hydrodynamics and hydromagnetics, has been given by Chandrasekhar [2]. Veronis [3] has considered the problem of thermohaline convection in a layer of fluid heated from below and subjected to a stable salinity gradient. The thermohaline convection in a horizontal layer of viscous fluid heated from below and salted from above has been studied by Nield [4]. In thermohaline-convective instability problem, buoyancy forces can arise not from density differences due to variations in temperature but also from those due to variations in solute concentrations. The conditions under which convective motions are important in stellar atmospheres are usually far

removed the consideration of a single component fluid and rigid boundaries and therefore it is desirable to consider one gas component acted on by solute concentration gradient and free boundaries. The thermosolutal-convective instability of a stellar atmosphere in the presence of suspended particles has been studied by Sharma and Singh [5]. The criteria for monotonic instability are derived and are found to hold good also in the presence of uniform rotation and uniform magnetic field on the thermosolutal-convective instability.

A partially ionized plasma represents a state which often exists in the Universe. There are several situations where the interaction between the ionized and neutral gas components becomes important in cosmic physics. As a reasonably simple approximation, the plasma may be idealized as a composite mixture of a hydromagnetic (ionized) component and a neutral component, the two interacting through mutual collisional (frictional) effects. Hans [6] made this simplified approximation and found that these collisions have a stabilizing effect on the Rayleigh-Taylor instability.Marcu and Ballai [7] have studied the thermosolutal linear stability of a composite two-component plasma in the presence of Coriolis forces, finite Larmor radius, taking into account the collisions between neutral and ionized particles. The thermosolutal instability appears due to a material convection (thermosolutal convection) in a two component fluid with different molecular diffusivities which contribute in an opposing sense to the locally vertical density gradient. Natural convection with Soret and radiation effects in a binary fluid saturating a horizontal porous layer under the influence of magnetic field has been investigated by Israel-Cookey and Amos [8]. Sheri et. al [9] has studied the transient radiative reactive thermosolutal magnetohydrodynamic convection in inclined MHD hall generator flow with dissipation and cross diffusion.

In the present paper we consider the thermosolutal-convective instability in Stern's type configuration of a stellar atmosphere (the thermal-convective instability in the presence of stable solute gradient) to include the radiative transfer effect. The effects of radiative transfer and rotation are also studied on the thermosolutal-convective instability. The effects of radiative transfer arise when self absorption is not negligible. As a partially ionized plasma represents a state which often exists in the Universe, the problem of thermosolutal-convective instability of a hydromagnetic composite medium is, therefore, studied to include the frictional effects with neutrals. Theseaspects form the subject matter of the present study.

2. Description of the Instability and Perturbation Equations

Consider an infinite horizontal fluid layer of thickness d heated from above and subjected to a stable solute concentration gradient so that the temperatures and solute concentrations at the bottom surface $z = 0$are T_0 and C_0 and at the upper surface $z = d$ are T_1 and C_1 respectively, z -axis being taken as vertical. This layer is acted on by a gravity force $\vec{g}(0,\ 0,\ -g)$. Then, following the Boussinesq approximation, which states that the inertial effects produced by density variation are negligible in comparison to its gravitational effects i.e. ρ can be taken as constant everywhere in the equations of motion except in the term with external force, consequently the equations governing the motion of the fluid assume the following form:

$$\frac{\partial \vec{v}}{\partial t} + (\vec{v}\ .\ \nabla)\vec{v} = -\frac{1}{\rho_0}\nabla p + \nu\,\nabla^2\vec{v} + \vec{g}\left(1 + \frac{\delta\rho}{\rho_0}\right), \tag{2}$$

$$\nabla.\vec{v} = 0\,, \tag{3}$$

$$\frac{\partial C}{\partial t} + (\vec{v}\ .\ \nabla)C = \kappa'\nabla^2 C\,, \tag{4}$$

$$\rho = \rho_0[1 - \alpha(T - T_0) + \alpha'(C - C_0)]. \tag{5}$$

The suffix zero refers to values at the reference level $z = 0$. Equations (2) – (4) express respectively the conservation of momentum,

mass and solute mass concentration. Equation (5) represents the equation of state. Here $\rho, p, T, C, \vec{v}(u, v, w), g, \alpha \; and \; \alpha'$ stand for density, pressure, temperature, solute concentration, velocity, gravitational acceleration, thermal coefficient of expansion and an analogous solvent coefficient, respectively. The kinematic viscosity, the thermal diffusivity κ and the solute diffusivity κ' are each assumed to be constant.

The steady state solution is

$$\vec{v} = 0, T = T_0 + \beta z, C = C_0 - \beta' z, \rho = \rho_0[1 - \alpha\beta z - \alpha'\beta' z'], \quad (6)$$

where

$$\beta = \frac{T_1 - T_0}{d}, and \; \beta' = \frac{C_0 - C_1}{d}$$

are the magnitudes of uniform temperature and concentration gradients.

We now consider a small perturbation on the steady state solution and let $\vec{v}, \delta\rho, \delta p, \theta$ and γ denote the perturbations in velocity, density, pressure, temperature and solute concentration respectively so that the change in density $\delta\rho$, caused by the perturbations $\theta \; and \; \gamma$ in temperature and concentration, is given by

$$\delta\rho = -\rho_0(\alpha\theta - \alpha'\gamma). \quad (7)$$

Equations (2) – (4) on linearization give

$$\frac{\partial \vec{v}}{\partial t} = -\frac{1}{\rho_0}\nabla\delta p + \nu\nabla^2\vec{v} - \vec{g}(\alpha\theta - \alpha'\gamma), \quad (8)$$

$$\nabla . \vec{v} = 0, \quad (9)$$

$$\frac{\partial \gamma}{\partial t} - \kappa'\nabla^2\gamma = \beta' w. \quad (10)$$

Now, the first law of thermodynamics may be written in the form

$$C_v\frac{dT}{dt} = -L + \frac{K}{\rho}\nabla^2 T + \frac{P}{\rho^2}\frac{d\rho}{dt}, \quad (11)$$

where $L, K, C_v, T, t \; and \; \rho$ denote respectively, the heat-loss function, the thermal conductivity, the specific heat at constant volume, the temperature, the time and the pressure.

Following Defouw [1], the linearized perturbation form of equation (11) is

$$\frac{\partial\theta}{\partial t} + \frac{1}{C_p}(L_T - \rho\alpha L_\rho)\theta - \kappa\nabla^2\theta = -\left(\beta + \frac{g}{C_P}\right)w. \quad (12)$$

The effects of radiative transfer arise when self-absorption is not negligible. In considering the heat-loss function $L(\rho, T)$ to be dependent only on the local values of density and temperature, it is assumed that the gas is optically thin. We shall study radiative transfer with the Eddington approximation which is accurate in both the optically thick and optically thin limits as pointed by Unno and Spiegel [10].

The heat equation for a grey gas, using this approximation, may be written as

$$\rho C_v\frac{dT}{dt} - \frac{p}{\rho}\frac{d\rho}{dt} = \nabla.\left[\frac{1}{3m\rho}\nabla\left\{\frac{1}{m\rho}\left(\rho C_v\frac{dT}{dt} - \frac{p}{\rho}\frac{d\rho}{dt}\right) + 4\pi S\right\}\right], \quad (13)$$

where m is the mass absorption coefficient and S is the source function.

Since the layer depth is small and the temperature gradient maintained is also small so that their product is very small in comparison with the temperature of the lower boundary, the temperature at an intermediate point may be approximately taken as the temperature of the lower boundary. The source function S and the mass absorption coefficient m may, therefore, be treated as independent of height in the equilibrium state. Then the linearized perturbation form of equation (12) may be obtained as

$$3m^2\rho^2\frac{\partial\theta}{\partial t} - \frac{4\pi m}{C_P}(S_T - \rho\alpha S_P)\nabla^2\theta - \frac{\partial}{\partial t}\nabla^2\theta = -\left(\beta + \frac{g}{C_P}\right)(3m^2\rho^2 w - \nabla^2 w), \quad (14)$$

where S_T and S_ρ denote respectively the partial derivatives of S with respect to T and ρ.

We consider the case in which the boundaries are free as well as perfect conductors of both heat and solute. The density changes arise principally from thermal effects. The case of two free boundaries is most appropriate for stellar atmospheres as pointed by Spiegel [11]. The boundary conditions appropriate for the problem are

$$w = {\partial^2 w}/{\partial z^2} = \theta = \gamma = 0.$$

3. The Dispersion Relation

We shall now analyze an arbitrary perturbation into complete set of normal modes by seeking solutions whose dependence on space and time coordinates is of the form

$$exp\left(ik_x x + ik_y y + nt\right) \sin k_z z\,, \qquad (15)$$

where n is the growth rate and $k_z = {s\pi}/{d}$, s being any integer and d is the thickness of the layer and $k = \left(k_x^2 + k_y^2 + k_z^2\right)^{1/2}$ is the wave number of the perturbation.

Equations (8) – (10) and (14) give

$$\frac{\partial}{\partial t}(\nabla^2 w) = g\left(\frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2}\right)(\alpha\theta - \alpha'\gamma) + \nu\nabla^4 w\,, \qquad (16)$$

$$\left(\frac{\partial}{\partial t} - \kappa'\nabla^2\right)\gamma = \beta' w\,, \qquad (17)$$

$$\left(\frac{\partial}{\partial t} + E\right)\theta = -\left(\beta + \frac{g}{C_P}\right)w\,, \qquad (18)$$

where

$$E = \frac{4\pi m\left(S_T - \rho\alpha S_\rho\right)}{C_P\left(1 + \frac{3m^2\rho^2}{k^2}\right)}\ . \qquad (19)$$

The system of equations (16) - (18) together with boundary conditions

$$w = {\partial^2 w}/{\partial z^2} = \theta = \gamma = 0.$$

constitutes a characteristics value problem for n, for given values of the parameters and a given state of system is stable, neutral or unstable according as n_r , the real part of n, is negative , zero or positive. Further, if $n_r = 0 \Rightarrow n_i = 0$ for all wave number k, then the principle of exchange of stabilities (PES) is valid otherwise we have overstability atleast when instability sets in as certain modes. The above system of equations can be solved by using linear stability analysis method.

Eliminating θ, γ from equations $(16) - (18)$ and using (16), we obtain the dispersion relation

$$n^3 + [E + k^2(\nu + \kappa')]n^2 + \left[k^2 E(\nu + \kappa') + \Gamma\left(\beta + \frac{g}{C_P}\right) + \nu\kappa' k^4 + \Gamma'\beta'\right]n + \left[\Gamma\left(\beta + \frac{g}{C_P}\right)\kappa' k^2 + (\nu\kappa' k^4 + \Gamma'\beta')E\right] = 0\,, \qquad (20)$$

where

$$\Gamma = g\alpha\frac{k_x^2 + k_y^2}{k^2}\ and\ \Gamma' = \frac{g\alpha'\left(k_x^2 + k_y^2\right)}{k^2}. \qquad (21)$$

4. Discussion and Further Extensions

Theorem 1: Acriterion that a stellar atmosphere in the presence of stable solute concentration gradient and radiative transfer effect is unstable if

$$S_T - \frac{\rho}{T}S_\rho < 0\ and\ |(\nu\kappa' k^4 + \Gamma'\beta')E| > \Gamma\left(\beta + \frac{g}{C_P}\right)\kappa' k^2\ .$$

Proof: Taking the dispersion relation (20), when

$$S_T - \frac{\rho}{T}S_\rho < 0\ and\ |(\nu\kappa' k^4 + \Gamma'\beta')E| > \Gamma\left(\beta + \frac{g}{C_P}\right)\kappa' k^2\ , \qquad (22)$$

The constant term in relation (20) is negative. Equation (20), therefore, involves one change of sign and hence contains one positive real root. The occurrence of positive root implies monotonic instability.

We thus obtain a criterion that a stellar atmosphere in the presence of stable solute concentration gradient and radiative transfer effect is unstable if

$$S_T - \frac{\rho}{T}S_\rho < 0 \; and \; |(\nu\kappa' k^4 + \Gamma'\beta')E| > \Gamma\left(\beta + \frac{g}{C_P}\right)\kappa' k^2 \; , \quad (23)$$

Hence the result.

Further Extension-1: The rotation induces a component of vorticity in the direction of rotation. The effects of radiative transfer arise when self-absorption is not negligible. It may be of some interest to examine the influence of radiative transfer and rotation on thermosolutal-convective instability of a stellar atmosphere.

Theorem 2: The criterion for monotonic instability (22) also holds good in the presence of radiative transfer and rotation effects on thermosolutal-convective instability in Stern's type configuration in a stellar atmosphere.

Proof: Here we consider an infinite horizontal fluid layer heated from above and solute concentrated from below and acted on by a uniform rotation $\vec{\Omega}(0,0,\Omega)$ and gravity force $\vec{g}(0,0,-g)$. The linearized perturbed equations of motion become

$$\frac{\partial \vec{v}}{\partial t} = -\frac{1}{\rho_0}\nabla\delta p + \nu\nabla^2\vec{v} - \vec{g}(\alpha\theta - \alpha'\gamma) + 2\left(\vec{v}\times\vec{\Omega}\right), \quad (24)$$

Equations (9), (10) and (14) remain unaltered.

Equations (9), (10), (14) and (24) give

$$\frac{\partial}{\partial t}(\nabla^2 w) = g\left(\frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2}\right)(\alpha\theta - \alpha'\gamma) + \nu\nabla^4 w - 2\Omega\frac{\partial\zeta}{\partial z} \; , \quad (25)$$

$$\frac{\partial\zeta}{\partial t} - \nu\nabla^2\zeta = 2\Omega\frac{\partial w}{\partial z} \; , \quad (26)$$

where

$$\zeta = \frac{\partial v}{\partial z} - \frac{\partial u}{\partial y}$$

denotes the z-component of vorticity, Equations (17) and (18) remain the same. Eliminating θ , ζ and γ from equations (17), (18), (25) and (26) and using expression (15), we obtain the dispersion relation

$$\begin{aligned} &n^4 + [E + k^2(2\nu + \kappa')]n^3 \\ &+ \left[\nu\kappa' k^4 + \Gamma'\beta' + Ek^2(\nu + \kappa') + \Gamma\left(\beta + \frac{g}{C_P}\right)\right. \\ &\left. + \nu k^2(E + k^2\overline{\nu + \kappa'}) + \frac{4\Omega^2 k_z^2}{k^2}\right]n^2 \\ &+ \left[(\nu\kappa' k^4 + \Gamma'\beta')E + \Gamma\left(\beta + \frac{g}{C_P}\right)k^2(\nu + \kappa')\right. \\ &+ \nu k^2\{\nu\kappa' k^4 + \Gamma'\beta' + k^2 E(\nu + \kappa')\} \\ &\left. + \frac{4\Omega^2 k_z^2}{k^2}(E + \kappa' k^2)\right]n \\ &+ \left[\nu k^2\left\{(\nu\kappa' k^4 + \Gamma'\beta')E + \kappa' k^2\Gamma\left(\beta + \frac{g}{C_P}\right)\right\}\right. \\ &\left. + 4\Omega^2 k_z^2\kappa' E\right] = 0. \end{aligned} \quad (27)$$

When (22) is satisfied, the constant term in equation (27) is negative. The product of the roots must be negative. Therefore at least one root of equation (27) is positive and one root is negative. The occurrence of positive root implies monotonic instability. The criterion for monotonic instability thus holds good in the presence of radiative transfer and rotation effects on thermosolutal-convective instability in a stellar atmosphere.

Further Extension-2: Further we study the effect of collisions on thermosolutal-convective instability of a composite medium. Quite frequently it happens that the plasma is not fully ionized and may instead be permeated with neutral atoms. The plasma may be idealized, therefore, following Hans [6], as a composite mixture of a hydromagnetic (ionized) component and a neutral component, the two interacting through mutual collisional (frictional) effects. A partially ionized plasma represents a

state which often exists in the universe. Hence it is of interest to investigate the influence of these frictional effects with neutrals on thermosolutal-convective instability of a composite medium.

Here we consider an infinite horizontal composite layer consisting of a finitely conducting hydromagnetic fluid of density ρ and a neutral gas of density ρ_d, acted on by a uniform vertical magnetic field $\vec{H}(0,0,H)$ and gravity force $\vec{g}(0,0,-g)$. This layer is heated from above and solute concentrated from below such that a steady temperature gradient $\beta\left(=dT/_{dz}\right)$ and a concentration gradient $\beta'\left(=-dC/_{dz}\right)$ are maintained. Regarding the model under consideration we observe that the number density of neutral particles is extremely smaller than the number density of ionized particles (Tanenbaum [12]). The pressure and buoyancy effects acting on neutral particles, therefore, have negligible influence (the volume fraction of the neutral particles being extremely small) whereas they are significant in the case of ionized component. In a partially ionized gas the magnetic field interacts with the charged component and is not directly affected by the neutral component (Parker [13]).

Now we prove the following Theorem :

Theorem 3: A criterion that the thermosolutal-convective instability of a composite stellar atmosphere in the presence of stable solute concentration gradient and collisional effects is unstable if

$$D < 0 \ and \ |(\nu\kappa' k^4 + \Gamma'\beta')D| > \Gamma\left(\beta + \frac{g}{C_P}\right)\kappa' k^2.$$

Proof: Let $\vec{h}(h_x, h_y, h_z)$, η, $\overrightarrow{v_d}$ and ν_C denote respectively the perturbation in magnetic field $\vec{H}$, the resistivity, the velocity of the neutral gas and the collision frequency between the two components of the composite medium. Then the linearized perturbation equations appropriate to the problem are

$$\frac{\partial \vec{v}}{\partial t} = -\frac{1}{\rho_0}\nabla\delta p + \nu\nabla^2\vec{v} + \frac{1}{4\pi\rho_0}\left(\nabla\times\vec{h}\right)\times\vec{H} + \vec{g}\frac{\delta\rho}{\rho_0} + \frac{\rho_d\nu_C}{\rho_0}(\overrightarrow{v_d} - \vec{v}), \quad (28)$$

$$\frac{\partial \overrightarrow{v_d}}{\partial t} = -\nu_C(\overrightarrow{v_d} - \vec{v}), \quad (29)$$

$$\frac{\partial \vec{h}}{\partial t} = \nabla\times\left(\vec{v}\times\vec{H}\right) + \eta\nabla^2\vec{h}, \quad (30)$$

$$\nabla.\vec{h} = 0, \quad (31)$$

together with equations (7), (9), (10) and (12). Equations (7), (9), (10), (12) and (28)-(31) give

$$\frac{\partial}{\partial t}\left(1 + \frac{\alpha_0\nu_C}{\frac{\partial}{\partial t} + \nu_C}\right)(\nabla^2 w) = g\left(\frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2}\right)(\alpha\theta - \alpha'\gamma) + \nu\nabla^4 w + \frac{H}{4\pi\rho_0}\nabla^2\frac{\partial h_z}{\partial z}, \quad (32)$$

$$\left(\frac{\partial}{\partial t} - \eta\nabla^2\right)h_z = H\frac{\partial w}{\partial z}, \quad (33)$$

$$\left(\frac{\partial}{\partial t} + D\right)\theta = -\left(\beta + \frac{g}{C_P}\right)w, \quad (34)$$

$$\left(\frac{\partial}{\partial t} - \kappa'\nabla^2\right)\gamma = \beta' w, \quad (35)$$

where $\alpha_0 = \rho_d/\rho_0$

Eliminating θ, γ and h_z from equations (32)-(35) and using expression (15), we obtain the dispersion relation

$$n^5 + A_4 n^4 + A_3 n^3 + A_2 n^2 + A_1 n + A_0 = 0, \quad (36)$$

where

$$A_4 = D + \nu_C(\alpha_0 + 1) + k^2(\nu + \eta + \kappa')$$

$$A_3 = \kappa'\eta k^4 + k^2 D(\eta + \kappa') + (\nu_C + \nu k^2 + \alpha_0 \nu_C)\{D + k^2(\eta + \kappa')\} + \nu k^2 \nu_C + \Gamma\left(\beta + \frac{g}{C_P}\right) + \Gamma'\beta' + k_z^2 V_A^2,$$

$$A_2 = \kappa'\eta k^4 D + (\nu_C + \nu k^2 + \alpha_0 \nu_C)\{\kappa'\eta k^4 + k^2 D(\eta + \kappa')\} + \nu k^2 \nu_C\{D + k^2(\eta + \kappa')\} + \Gamma\left(\beta + \frac{g}{C_P}\right)(\nu_C + \eta k^2 + \kappa' k^2) + \Gamma'\beta'(\nu_C + \eta k^2 + D) + k_z^2 V_A^2(\nu_C + \kappa' k^2 + D),$$

$$A_1 = \kappa'\eta k^4 D(\nu_C + \nu k^2 + \alpha_0 \nu_C) + \nu k^2 \nu_C\{\kappa'\eta k^4 + k^2 D(\eta + \kappa')\} + \Gamma\left(\beta + \frac{g}{C_P}\right)\{\eta k^2 \nu_C + \kappa' k^2(\nu_C + \eta k^2)\} + \Gamma'\beta'\{\eta k^2 \nu_C + D(\nu_C + \eta k^2)\} + k_z^2 V_A^2\{\kappa' k^2 \nu_C + D(\nu_C + \kappa' k^2)\},$$

$$A_0 = \eta k^2 \nu_C\left\{(\nu\kappa' k^4 + \Gamma'\beta')D + \Gamma\left(\beta + \frac{g}{C_P}\right)\kappa' k^2\right\} + k_z^2 V_A^2 D\kappa' k^2 \nu_C, \quad (37)$$

where

$$V_A^2 = \frac{H^2}{4\pi\rho_0}.$$

When

$$D < 0 \ \ and \ |(\nu\kappa' k^4 + \Gamma'\beta')D| > \Gamma\left(\beta + \frac{g}{C_P}\right)\kappa' k^2, \quad (38)$$

the constant term in equation (36) is negative. Equation (36), therefore, involves one change of sign and hence contains one positive real root. The occurrence of positive root implies monotonic instability.

We thus obtain a criterion that the thermosolutal-convective instability of a composite stellar atmosphere in the presence of stable solute concentration gradient and collisional effects is unstable if

$$D < 0 \ \ and \ |(\nu\kappa' k^4 + \Gamma'\beta')D| > \Gamma\left(\beta + \frac{g}{C_P}\right)\kappa' k^2.$$

The criterion for monotonic instability is the same in the presence or absence (Sharma and Sharma [14]) of the collisional effect on thermosolutal-convective instability of a composite stellar atmosphere.

FREEDOM OF WORSHIP TO WOMEN: WHITHER COMMITMENT

Dr. Veena Kumari,Assistant Professor,University Institute of Legal Studies,Himachal Pradesh University,Shimla

Abstract: Indian Constitution has provided the Right to Equality, Right against Discrimination, Right to Worship and many other fundamental and constitutional rights to the women at par with men. On papers, women enjoy equal status with men. But the reality is somewhat different. Sadly, they are not enjoying their rights fully. Reasons are many and one among those is the biological feature of their body i.e. menstruation. This feature of their body has been made a reason for discrimination by religious beliefs and myths. Because of this they are deprived of their rights and this happened in Sabarimala, where women of fertile age group were not allowed to enter the temple and perform prayers there. When this issue was first raised in Kerala High Court it upheld the restriction. But in 2018 Supreme Court of India lifted up the ban and allowed the women of every age group to enter the temple. It was not only a fight to women's rights in the Court but also a conflict between religion and Constitution arose in which Constitution won. But it has failed somewhere to change the mental set up of people as there were protests by the people including women against the judgment. Education and awareness are the weapons which can change the society and importance to women in religious works such as their appointments as priests should be promoted.

KEY WORDS: Fundamental Rights, Worship, Menstruation, sabrimala tample

Introduction

"If by strength is meant moral power, then woman is immeasurably man's superior."[1] She is great Goddess - a boon giver, she is Nature (prakriti) which makes this world worth living, and she is Shakti who kills demons. India is a country where woman is worshiped in the temples as Goddess and this is not enough to understand what a woman is. A woman is an essential and integral part of society without whom life is not possible. From household to education, sports, politics, science and technology they have done their best and contributed in the development of nation. No doubt many rights are given to them by Constitution of India and other laws of the country, and government has initiated many schemes for the up liftment and security of woman. On one hand there are many rights and opportunities given to women and on the other hand they are deprived of their rights sometimes on the name of society, sometimes in the name of religious practices and many other reasons. Why so? When man and woman both are equal then why woman's rights are sacrificed? Constitution of India, the supreme law of the land has given many rights to people of India and other individuals as well such as equality. Equality means everyone is equal in the eyes of law [2] and there should be no discrimination on the grounds of religion, race, caste, sex and place of birth[3] But sadly there are many religious practices or strong beliefs because of which they are deprived of their rights or we can say that they can't use them. The menstruating nature of a female body is one of the reasons of discrimination as during these days they are not allowed to worship, to enter temples, touch the holy books, do prayers and such type of activities which is an infringement of their right to equality, right to worship and right against discrimination, hence this practice is totally anti constitutional. Sadly this practice is prevailing in our society on large scale whether at homes or at temples. The women are taught from childhood not to practice any kind of activity related to worship during these

days. In Public places, there are wide spread customs prohibiting the women to enter the religious establishments. This issue of discrimination came into light in Subrimala Temple, where as per the custom it takes forty days of purification (vratam) to enter this temple, women of certain age group, which is the fertile age of a woman, were not allowed to enter the holy shrine. The reason was during forty days a woman of fertile age is supposed to bleed and hence she does not remain pure. This practice was utter discrimination of their right to pray because of the menstruation they undergo every month. This practice is not restricted to a particular region or religion but is widely spread across the countries. In musjids, women of all age are not allowed to participate in *namaaz.* Amongst Hindus, Women are not allowed to enter the religious places during their menstruation period. They are even compelled to live in separate accommodations and even compelled to live in the cattle sheds where separate place is not available. Women menstruation cycle which is a physiological process and totally natural has become an instrument of discrimination, which has not only affected the rights of the women but has also, affected their psychological, social and mental health. Judiciary has given many verdicts and states that woman and man both are equal and the Constitution of India has also given Right to Equality to all persons.[4] But sadly the practice differs from the Constitutional provisions.

Menstruation Taboo:

Menstruation taboo is a kind of social taboo, which is linked with menstruation. Menstruation is the normal bleeding that occurs to women as monthly cycles. It is totally a biological and natural process. But in some societies it is considered as unclean and impure. There are many myths related to menstruation cycle and these myths are the mothers of religious beliefs which are discriminatory to women. These religious and social practices have such an impact on the mental setup of the society to such an extent that it is considered to be a forbidden subject to be discussed in public. As a result there is lack of awareness in the society regarding psychological, mental and physical health of women during Menstruation. On the contrary, women are prohibited from entering the religious places, kitchen. In the conservative Indian Society, women are considered as untouchable and impure during this period. They are not allowed to enter the public religious places among Hindus, Muslims and Parsis. Outside public places of worship, there are deep rooted notions of women's impurity during menstruation. They are restricted from touching the religious books and objects, doing prayers, cooking and entering the kitchen. There is no need of any signboard to keep bleeding women out of these places. Girls are socialized into period norms from a very young age. Not only this, the menstruating nature of their bodies is the reason to deny their role as priests, pandits, qazis, imaams. Menstrual period is considered as a sin of the women for which atonement is required. Among Hindus, a specific fast (Chandan shashti vrat),which women takes once in a year as atonement for touching kitchen or entering worship places by mistake during menstrual cycle. In many parts of India, women are not allowed to sleep in the bed, enter the main house, touch the other family members of the family or eat spicy food[5] . They are forced to live in the cowsheds or huts made specifically for the purpose. The impact of such practices on the psychology of girls on the initial years of mensuretion is unimaginable. We can observe the heights of hypocrisy in our society on this issue. Where on one side a Goddess Kamakhya is worshiped by us and the Earth's menstruation is celebrated during the Ambabuchi Mela, an annual fertility festival held in June in Assam, on the other side menstruating woman is restricted from religious activities.

Constitutional and Legal Rights of Women

"*I measure the progress of a community by the degree of progress which women have achieved*."These great lines are given by Dr. B.R Ambedkar and by these lines we can understand that by the progress of women the whole community progresses. The rights given to women can be classified into two categories such as Constitutional rights and Legal rights. Constitutional rights are the rights which are enshrined in the Constitution of India and legal rights are those rights which are provided in various Acts of Parliament and State Legislature. Equality before law is well defined under the Article 14 of the Constitution which ensures that every citizen shall be protected by the laws of the country and State will not discriminate any of the Indian citizens on the basis of their gender, caste, creed, religion or even the place of birth. Recently in a judgment, Supreme Court of India held that the absolute exclusion of women from command assignments is against Article 14 of the Constitution and unjustified. Hence, the policy the women will be given only staff appointment was held to be unenforceable by the court." According to Constitution of India, the State shall not discriminate any citizen of India on the ground of religion, race, caste, sex and place of birth[6.] Article 15 secures the citizens of India from every sort of discrimination by State, on the grounds of religion, race, caste, sex

and place of birth. According to this Article not only State but private person also cannot discriminate anyone on the ground of religion, race, caste, sex and place of birth. Hence, this is a right provided to women against discrimination by Constitution of India. There shall not be any discrimination to women on the ground of being a woman. This right also guarantees the equal treatment of the women even in the religious activities. According to Article 15 (3) State is empowered to make any special provision for the development of women and children. The great example of this provision is reservation of seats for women in the local bodies and provision of free education to children. In ***Government of A.P v. P.B Vijaya kumar*** [7]The Supreme Court explaining the object of Article 15(3) observed that : "The insertion of clause (3) of Article 15 in relation to women is a recognition of the fact that for centuries, women of this country have been socially and economically handicapped. As a result, they are unable to participate in the socially and economic activities of the nation on a footing of equality. It is in order to eliminate this socio-economic backwardness of women and to empower them in a manner that would bring about effective equality between men and women that clause (3) is placed in Article 15. Its object is to strengthen and improve the status of women. "The other Important right provided to all the human beings is Right to life, which also includes right to live with dignity[8]. Women also have right to live with dignity .If a women is prohibited from entering a religious place; it is not only the violation of their right of dignity but also affects their Pschycology. Article 25 of the Indian Constitution guarantees the freedom of religion to all the citizens without any discrimination on the basis of cast, sex, religion etc. This Article provides the right to women to practice profess, propagate their religion without any discrimination. To enter in the religious premises can be considered as the part of this right. Apart from these rights, there are some fundamental duties, which are imposed the protection of dignity of women. However, the practices throughout India shows that this right is denied to women of different religions in the name of customs, religious practices etc .

Sabarimala Issue

Sabrimala temple is the temple of Lord Ayappa situated in the Sabri hills of Kerala in Sabrimala temple, there was a ban on the entry of women of menstruating age group (10 to 50 years) in the holy shrine. A verdict was given by Supreme Court in 2018 which lifted up the ban and allowed the women of every age group to enter the holy shrine. Huge protest was done against and for the verdict by the people. Sabrimala temple is one of the largest pilgrimages of the world and according to an estimate about 3.5 crore Hindu pilgrims visited the temple in 2017. Lord Ayyappan is the son of Shiva and Mohini [9] and is of celibate nature. His celibacy is the one reason on the ban of entry of women of 10 to 50 years of age group. The reason why this temple became so famous is that there was ban on the entry of women of menstruating nature. They were banned even from making the trek to the shrine .The justification which was given for this prohibition was that, the devotees who come to Sabrimala temple has to do the vratam of 40 days before entering the temple and worshiping there. It is believed that a woman of menstruating age group is unable to do vratam of 40 days period because of monthly bleeding. Because of this monthly bleeding they do not qualify to embark the pilgrimage. According to the rules of Kerala Hindu Places of Public Worship (Authorization of Entry) Rules 1965 the ban on the menstruating women was enforced.[10] In 1991 the High Court of Kerala upheld the ban on the women of menstruating age to enter the holy shrine[11]. Regarding the entry of women rules were framed under section 9 of the Temple Entry Act. Rule 6 (c) framed there under relates to entry of women. The restriction is only for entry of women at such time during which they are not by customs and usages allowed to enter temples. The Board issues notification every year informing the public about the prohibition regarding entry of women of age group of 10 to 50 years in the Sabrimala temple.

The whole issue of Sabarimala temple started when a petition was filed in the Supreme Court challenging the verdict of Kerala High Court which upheld the ban on the entry of women of menstruation age group in the Sabarimala temple [12]. The ban which was upheld by the Kerala High Court on the entry of women was against the right to equality and right to worship. The practice of the restriction on the women of menstruating age group to enter the temple was derogatory to the dignity of women. The Supreme Court observed that restrictions on women to enter the worshiping places are not only in sabarimala but in other places also. The Supreme Court held that the ban on the entry of women is against the Right of Equality and Right of Worship. This is the violation of the rights of women granted by the Constitution of India. It was further observed by the Court that everyone has right to freely profess, practice and propagate their religious beliefs as per the Constitution of India [13]. The practice prevailed there is an utter discrimination and the violation of the right to equality. On September 28,

2018 the Supreme Court of India gave its judgment on the Sabrimala issue. The Court held that the practice of non entry of women of menstruating age group in the temple is unconstitutional and discriminatory in nature. It is violation of the rights of women. The Court struck down the rule 3 (b) of the Kerala Hindu Places Of Public Worship Act by stating that it is totally unconstitutional as it allows the restriction on the entry of women in the temple if the restriction is based on the usages and customs prevailed there. The dissent opinions were given by the judges of the bench which included Chief justice Deepak Mishra, Justice Nariman, Justice Chandra chud and Justice Indu Malhotra.

After the judgment many female devotees of this age group tried to enter the temple but they were stopped in their way sometimes by the men and sometimes by women. They faced the great resistance and violence from the men and women. The protests and hartals by the people show that people were not happy with the verdict of Supreme Court. Where it was a step towards the concept of equality there on the other side some people were showing anger against the verdict. The change in the society was not accepted by some people and they did not want these types of practices to stop.

Sabrimala Review Petition:

The Supreme Court received almost 56 petitions for review of the judgement allowing the women to enter the temple. On November 14, 2019 a five judge bench referred the Sabarimala review petitions to a seven judge bench which was headed by Chief Justice of India Ranjan Gogoi. Justices Chandrachud and Nariman held that when a judgment is delivered, it is final and binds all. The Supreme Court did not changed its judgment regarding the entry of women in the temple and also added other issues related to women with this issue. In another case ***Dr. Noorjahan Safia Niaz v. Y.N Bhardwaj*** [14], there was a petition filed under Article 226 of Constitution by petitioners who were some social activists against the restriction on women's entry in Haji Ali Dargah before the High Court of Bombay. The case was filed because of gender discrimination and denial of entry of women in the sanctum sanctorum at Haji Ali Dargah. The Trust argued that women were denied to enter the dargaah because the entry involved various kinds of risks. The risks were such as : the visibility of their breasts when they offered the prayers, entry of women in their periods, and sexual harassment. The Court held that these points are totally illogical with respect to the ban on the entry and the restriction of women on entering the Dargaah is the contravention of articles 14, 15 and 25 guaranteed by the Constitution of India. This judgment became the precedent and ended the deadlock of superstition and religious barriers in India. The Court further held the State accountable for providing adequate protection to women at places of public worship.

Another incident of restriction of women to enter the temple refers to ***Shani Signapur*** temple. In Maharashtra, the popular temple of Shani Shignapur was also famous for the ban on the entry of women. For many years, social reformers and activists were criticizing the this ban there. But this came into the picture in January 2016 when a woman entered the temple by mistake and after that the temple was closed for purity. The idol situated in the temple was purified and in order to purification the idol was bathed with milk. This act downgraded the women and after that Trupati Desai, a social activist, with her organization 'Bhumta Brigade' lead 1000 women activists and entered the temple forcefully. This was a move against the gender bias rules prevailing there. In Maharashtra, the Maharashtra Temple Entry Act, 1956 has banned women from entering the temple. The Bombay High Court opened the ways of women's entry into the Shani temple and said that no rule could prevent women from entering the temple. It was further held by the Court that the law should be same for everybody irrespective of any consideration.

Conflict between Religion and Constitution:

When the historical judgment of Sabarimala issue was delivered by the Supreme Court of India some people were highly dissatisfied by the judgment while some were celebrating the victory of women. Many people protested against the judgment in order to protect their precious religious practices while other were appreciating the judgment. The protest was not limited only with men, but women were also protesting against the judgment. When the petition was filed in the court against the practice prevailed in the Sabarimala temple, then the conflict between religion and Constitution arose. The supreme law of the land provides women with right to equality, right to worship and religion is not allowed to snatch these rights from them. Rules based on biological characteristics will not muster Constitution. The reason for not

providing the women their right to worship in the temple was the celibacy of the deity and to impose man's celibacy on woman is to deny women rights and the Constitution doesn't recognize such rights. These practices are not only unconstitutional but also against the basic human rights of women.

Conclusion

The women are an integral part of the society without whom life is not possible. In India, the irony is that, although the different Goddesses are worshipped but women of a specific age are not allowed to enter in the temples. Freedom of religion is provided to all the citizens of the country, which include women also, but they cannot enter the various religious places. We live in a patriarchal system of society where only woman has to sacrifice her rights. Gender inequality is the root of various discriminatory practices which is prevailed against the women. The rights of women are being infringed because of various religious beliefs. Gender discrimination is prohibited by the Constitution of India under Article 15 and in case of any infringement of this right; relief can be claimed through the court. But t is not easy to litigate against every instance of such discrimination because these norms are being followed in almost every home without any complaint. A biological process has become a reason for the violation of constitutional rights of women. Menstruation is a physiological process which is considered as impure by the society. However, there is nothing like impurity in this process. The deep rooted notions of women impurity has taken the shape of denial of their roles as pandits, qazis, imams and other positions related to worship or temple. This fact was proved by Hon'ble Supreme Court in its verdict of Sabarimala temple issue. Not only in this verdict but there are some other decisions given by Court in which the emphasis was on the right to equality and worship. The Court stated the practice of restriction on the entry of women totally discriminatory and gender bias. In the verdict of *Dr Noorjahan Safia's* case, the court held that the exclusion of women from entering the sanctum sanctorum is illegal and illogical and in the verdict given by the Bombay High Court in Shani Shignapur temple's issue ,the court also stated the. In the name of religious beliefs the women are deprived of their rights..

UDHR and ICCPR are the two covenants which provides the freedom of religion. India is signatory to both. UDHR provides that the every individual is free to profess and practice his religion. However, ICCPR says that freedom of religion is not absolute but restricted. It is restricted for the public safety, morality etc. But no where it is written that it should restrict the entry of women in worship places.

In order to eradicate such [i]malpractices certain initiatives are required to be taken. Due to illiteracy and lack of exposure women are not aware about their constitutional and legal rights. Education is the only solution of this problem. Legal literacy camps should be organized by the government in which law graduates and persons having the knowledge of law should be appointed to inform women about their rights. Secondly, Menstruation taboo is the biggest problem women are facing these days. They feel ashamed while talking about it. A biological process has become a matter of shame. Women should be informed about this process and also that there is nothing like impurity in it. The education and awareness are the only weapons to change the mentality of people. Girls should be empowered with the menstrual knowledge and hygiene so that the concept of impurity should be removed. Thirdly, Moves like "Happy to Bleed" should be started by activists and supported by government

Outside some worship places there are boards on which it is written that menstrual women is not allowed inside the sanctum sanctorum. Such type of boards should be removed and where there it is found written, strict action should be taken. Lastly, the Government should appoint women as pandits, qazis, imams etc. In religious worship places in order to stop gender discrimination should be stopped in religious places whether to perform worship inside the temple or any other religious place should be the discretion of the person. No one should be allowed to stop someone from entering the worship place. It must be the choice of the person and one should respect it.

14 CALL (COMPUTER ASSISTED LANGUAGE LEARNING): A VIRTUAL LEARNING PLATFORM FOR LANGUAGE DRILLS

Dr. Gitanjali Thapar

Abstract

Learning is a never ending process and the present day digital era has eased out the process of learning through online resources. Under blended learning concepts an innovative step towards learning grammar is CALL (Computer Assisted Language Learning) which is a well developed and diversifying field which encompasses a conceptualised approach towards language learning .The multidisciplinary nature of CALL includes psychological theory of B.F. Skinner. The methods are useful for applied linguistics and second language acquisition. The present paper attempts to evaluate the paradigm shift from classroom teaching methods to the virtual methods of Computer Assisted Language Learning. CALL is a multidisciplinary field which involves various contents and methods of language drills. The language drills of B.F.Skinner's operant conditioning model of linguistic behaviour would also be discussed.

Keywords: *CALL, Blended Learning*

Framing of community dynamics by small-town journalists in Dharamshala, India

By Harikrishnan Bhaskaran, Sandeep Sharma, Pradeep Nair, Harsh Mishra

Abstract

Dharamshala is home to the Tibetan Government-in-Exile. Its small-town journalism landscape is unique due to specific forms of community journalism practice adopted by Indian and Tibetan journalists. The Tibetan press there faces a paradox: simultaneously "local and community specific" for Tibetans-in-exile, "refugee voices" for the international community, and "foreign journalism" for Indians. This framing study identified interpretive packages in news coverage of conflict and integration between Dharamshala communities, by examining stories from community news outlets. Indian Hindi journalists enact a "community booster" role by actively framing issues of conflict in favor of the community, while Tibetan journalists' approach was comparatively more balanced.

HISTORICAL PERSPECTIVE OF WOMEN EMPOWERMENT IN INDIA

Sunil Kumar

Women constitute half of the human race. But their position in society is ambiguous. They have been subjected to all forms of discrimination and in every institutional structure extending from family to state. The subordination of women could be measured by the levels of their disproportionate representation in various areas of life such as education, employment, politics, health etc. Empowerment has become a fashionable concept nowadays. Earlier the term was used by political scientists. They used it in a very restricted sense and considered it as political power or usually the power politically assigned to an institution by the Constitution or by administrative rules. Later on, the concept became a tradition of the social sciences. With the coming of globalization, empowerment is now being increasingly applied to the economically poor nations and the weaker and subaltern masses of people. Actually the idea of empowerment is drawn from the concept of human rights. Human Rights in this sense are broader.

Keywords: Women, Empowerment, Historical Perspective

Women constitute half of the human race. But their position in society is ambiguous. They have been subjected to all forms of discrimination and in every institutional structure extending from family to state. The subordination of women could be measured by the levels of their disproportionate representation in various areas of life such as education, employment, politics, health etc.

There is no chance for the welfare of the world unless the condition of women is improved. Swami Vivekananda had said, "it is not possible for a bird to fly on only one wing". The greatest champions of women's rights have been great men like Raja Ram Mohan Ray, Maharishi Karve, Ishwar Chandra Vidyasagar, Gandhiji and ironically those who have systematically exploited and degraded them have also been of a largely male dominated society. Women have always been treated as a weaker section of human species. They have had an inferior status in society. We hear about so many organizations and programmes, which are being planned to improve the status of women.

A generalised approach to calculate various transport observables for a linear array of series and parallel quantum dots

Sushila Devi, P K Ahluwalia & Shyam Chand

Pramana **94**, Article number: 60 (2020)

150 Accesses | **1** Citations | Metrics

Abstract

A systematic generalised approach to find transport observables for a linear array of different quantum dot (QD) systems has been discussed, using non-equilibrium Green function (NEGF) formalism, in the presence of on-dot Coulomb interaction and inter-dot tunnelling. The equation of motion (EOM) method has been used to derive expressions for Green functions (GFs) within the simplest mean-field approximation to tackle the Coulomb correlation term. Starting from the mathematical structures of GFs for single, double and triple quantum dot systems, the expressions for GFs and transport observables have been generalised for the quantum dot systems containing N number of quantum dots in series as well as parallel linear array of dots. Further, the formulae so obtained have been used for numerical calculations of transmission probability and the I–V characteristics of linear arrays of quantum dots in series as well as parallel configuration containing up to three dots. The results show that, with the increase in number of dots in the scattering region, transmission probability and electron current decrease in series case, while both quantities increase in parallel configuration of dots. The inter-dot tunnelling leads to the splitting of transmission peaks in double QD system in series case whereas, it induces Fano effect in triple QD system in parallel configuration.

Appendix A

1.1 A.1 Equations of motion for Green's functions of dots

(a) *For the single quantum dot*

$$\omega\langle\langle c_\sigma, c_\sigma^\dagger\rangle\rangle^r = 1 + \varepsilon\langle\langle c_\sigma, c_\sigma^\dagger\rangle\rangle^r + U\langle\langle n_{-\sigma}c_\sigma, c_\sigma^\dagger\rangle\rangle^r + V_k^{\mathrm{L}}\langle\langle a_{k\sigma}, c_\sigma^\dagger\rangle\rangle^r + V_p^{\mathrm{R}}\langle\langle b_{p\sigma}, c_\sigma^\dagger\rangle\rangle^r \quad \text{(A.1)}$$

Further,

$$\langle\langle a_{k\sigma}, c_{1\sigma}^\dagger\rangle\rangle^r = V_k^{\mathrm{L}*} g_k^r \langle\langle c_\sigma, c_\sigma^\dagger\rangle\rangle^r$$

and

$$\langle\langle b_{p\sigma}, c_{1\sigma}^\dagger\rangle\rangle^r = V_p^{\mathrm{R}*} g_k^r \langle\langle c_\sigma, c_\sigma^\dagger\rangle\rangle^r.$$

(b) *For the double quantum dot in series*

$$(\omega - \epsilon_1)\langle\langle c_{1\sigma}, c_{1\sigma}^\dagger\rangle\rangle^r = 1 + V_d\langle\langle c_{2\sigma}, c_{1\sigma}^\dagger\rangle\rangle^r + U_1\langle\langle c_{1\sigma}n_{1-\sigma}, c_{1\sigma}^\dagger\rangle\rangle^r + V_k^{\mathrm{L}}\langle\langle a_{k\sigma}, c_{1\sigma}^\dagger\rangle\rangle^r \quad \text{(A.2)}$$

$$(\omega - \epsilon_2)\langle\langle c_{2\sigma}, c_{2\sigma}^\dagger\rangle\rangle^r = 1 + V_d^*\langle\langle c_{1\sigma}, c_{2\sigma}^\dagger\rangle\rangle^r + U_2\langle\langle c_{2\sigma}n_{2-\sigma}, c_{2\sigma}^\dagger\rangle\rangle^r + V_p^{\mathrm{R}}\langle\langle b_{p\sigma}, c_{2\sigma}^\dagger\rangle\rangle^r \quad \text{(A.3)}$$

$$(\omega - \epsilon_2)\langle\langle c_{2\sigma}, c_{1\sigma}^\dagger\rangle\rangle^r = V_d^*\langle\langle c_{1\sigma}, c_{1\sigma}^\dagger\rangle\rangle^r + U_2\langle\langle c_{2\sigma}n_{2-\sigma}, c_{1\sigma}^\dagger\rangle\rangle^r + V_p^{\mathrm{R}}\langle\langle b_{p\sigma}, c_{2\sigma}^\dagger\rangle\rangle^r \quad \text{(A.4)}$$

$$(\omega - \epsilon_1)\langle\langle c_{1\sigma}, c_{2\sigma}^\dagger\rangle\rangle^r = V_d\langle\langle c_{2\sigma}, c_{2\sigma}^\dagger\rangle\rangle^r + U_1\langle\langle c_{1\sigma}n_{1-\sigma}, c_{2\sigma}^\dagger\rangle\rangle^r + V_k^{\mathrm{L}}\langle\langle a_{k\sigma}, c_{1\sigma}^\dagger\rangle\rangle^r.$$

Typesetting math: 100%

Here

$$\langle\langle a_{k\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r} = V_{k1}^{\mathrm{L}*} g_{k}^{r} \langle\langle c_{1\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r}$$

and

$$\langle\langle b_{p\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r} = V_{p2}^{\mathrm{R}*} g_{k}^{r} \langle\langle c_{2\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r}.$$

(c) *For the double quantum dot in parallel*

$$\begin{aligned}(\omega - \epsilon_1)\,\langle\langle c_{1\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r} &= 1 + V_d \langle\langle c_{2\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r} \\ &+ U_1 \langle\langle c_{1\sigma} n_{1-\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r} + V_{k1}^{\mathrm{L}} \langle\langle a_{k\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r} \\ &+ V_{p1}^{\mathrm{R}} \langle\langle b_{p\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r}\end{aligned}$$

(A.6)

$$\begin{aligned}(\omega - \epsilon_1 - n_1 U_1)\,\langle\langle c_{1\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r} &= 1 + V_d \langle\langle c_{2\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r} \\ &+ V_{k1}^{\mathrm{L}} \langle\langle a_{k\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r} + V_{p1}^{\mathrm{R}} \langle\langle b_{p\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r}\end{aligned}$$

(A.7)

$$\begin{aligned}&\left(\omega - \epsilon_1 - n_1 U_1 - i\frac{\Gamma_{11}}{2}\right) \langle\langle c_{1\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r} \\ &\quad = 1 + V_d \langle\langle c_{2\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r} + i\frac{\Gamma_{12}}{2} \langle\langle c_{2\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r}\end{aligned}$$

(A.8)

$$\begin{aligned}&\left(\omega - \epsilon_2 - n_2 U_2 - i\frac{\Gamma_{22}}{2}\right) \langle\langle c_{2\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r} \\ &\quad = V_d \langle\langle c_{1\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r} + i\frac{\Gamma_{21}}{2} \langle\langle c_{1\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r}\end{aligned}$$

(A.9)

$$\begin{aligned}&\left(\omega - \epsilon_2 - n_2 U_2 - i\frac{\Gamma_{22}}{2}\right) \langle\langle c_{2\sigma}, c_{2\sigma}^{\dagger}\rangle\rangle^{r} \\ &\quad = 1 + V_d \langle\langle c_{1\sigma}, c_{2\sigma}^{\dagger}\rangle\rangle^{r} + i\frac{\Gamma_{21}}{2} \langle\langle c_{1\sigma}, c_{2\sigma}^{\dagger}\rangle\rangle^{r}\end{aligned}$$

(A.10)

$$\begin{aligned}&(\omega - \epsilon_1 - n_1 U_1)\,\langle\langle c_{1\sigma}, c_{2\sigma}^{\dagger}\rangle\rangle^{r} \\ &\quad = 1 + V_d \langle\langle c_{2\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r} + V_{k1}^{\mathrm{L}} \langle\langle a_{k\sigma}, c_{2\sigma}^{\dagger}\rangle\rangle^{r} \\ &\qquad + V_{p1}^{\mathrm{R}} \langle\langle b_{p\sigma}, c_{2\sigma}^{\dagger}\rangle\rangle^{r}\end{aligned}$$

(A.11)

$$\begin{aligned}&\left(\omega - \epsilon_1 - n_1 U_1 - i\frac{\Gamma_{11}}{2}\right) \langle\langle c_{1\sigma}, c_{2\sigma}^{\dagger}\rangle\rangle^{r} \\ &\qquad = 1 + V_d \langle\langle c_{2\sigma}, c_{2\sigma}^{\dagger}\rangle\rangle^{r} + i\frac{\Gamma_{12}}{2} \langle\langle c_{2\sigma}, c_{2\sigma}^{\dagger}\rangle\rangle^{r}.\end{aligned}$$

(A.12)

The Green's functions $\langle\langle a_{k\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r}$ and $\langle\langle b_{p\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r}$ arise due to the

Typesetting math: 100%

tunnelling of electrons between dots and leads. The EOM for these gives the following Dyson equations:

$$\begin{aligned}\langle\langle a_{k\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r} =& V_{k1}^{\mathrm{L}*} g_{k}^{\mathrm{r}} \langle\langle c_{1\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r} \\ &+ V_{k2}^{\mathrm{L}*} g_{k}^{r} \langle\langle c_{2\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r} \\ \langle\langle b_{p\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r} =& V_{p1}^{\mathrm{R}*} g_{k}^{r} \langle\langle c_{1\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r} \\ &+ V_{p2}^{\mathrm{R}*} g_{k}^{r} \langle\langle c_{2\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r}.\end{aligned}$$

(d) *For the triple quantum dots in series*

$$\begin{aligned}(\omega-\epsilon_1)\langle\langle c_{1\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r} &= 1+V_d\langle\langle c_{2\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r} \\ &+U_1\langle\langle c_{1\sigma}n_{1-\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r}+V_k^{\mathrm{L}}\langle\langle a_{k\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r}\end{aligned}$$

(A.13)

$$\begin{aligned}(\omega-\epsilon_2)\langle\langle c_{2\sigma}, c_{2\sigma}^{\dagger}\rangle\rangle^{r} &= 1+V_d^{*}\langle\langle c_{1\sigma}, c_{2\sigma}^{\dagger}\rangle\rangle^{r} \\ &+V_d\langle\langle c_{3\sigma}, c_{2\sigma}^{\dagger}\rangle\rangle^{r}+U_2\langle\langle c_{2\sigma}n_{2-\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r}\end{aligned}$$

(A.14)

$$\begin{aligned}(\omega-\epsilon_3)\langle\langle c_{3\sigma}, c_{3\sigma}^{\dagger}\rangle\rangle^{r} &= 1+V_d^{*}\langle\langle c_{2\sigma}, c_{3\sigma}^{\dagger}\rangle\rangle^{r} \\ &+U_3\langle\langle c_{3\sigma}n_{3-\sigma}, c_{3\sigma}^{\dagger}\rangle\rangle^{r}+V_p^{\mathrm{R}}\langle\langle b_{p\sigma}, c_{3\sigma}^{\dagger}\rangle\rangle^{r}\end{aligned}$$

(A.15)

$$\begin{aligned}(\omega-\epsilon_1)\langle\langle c_{1\sigma}, c_{2\sigma}^{\dagger}\rangle\rangle^{r} &= V_d\langle\langle c_{2\sigma}, c_{2\sigma}^{\dagger}\rangle\rangle^{r} \\ &+U_1\langle\langle c_{1\sigma}n_{1-\sigma}, c_{2\sigma}^{\dagger}\rangle\rangle^{r}+V_k^{\mathrm{L}}\langle\langle a_{k\sigma}, c_{2\sigma}^{\dagger}\rangle\rangle^{r}\end{aligned}$$

(A.16)

$$\begin{aligned}(\omega-\epsilon_1)\langle\langle c_{1\sigma}, c_{3\sigma}^{\dagger}\rangle\rangle^{r} &= V_d\langle\langle c_{2\sigma}, c_{3\sigma}^{\dagger}\rangle\rangle^{r} \\ &+U_1\langle\langle c_{1\sigma}n_{1-\sigma}, c_{3\sigma}^{\dagger}\rangle\rangle^{r}+V_k^{\mathrm{L}}\langle\langle a_{k\sigma}, c_{3\sigma}^{\dagger}\rangle\rangle^{r}\end{aligned}$$

(A.17)

$$\begin{aligned}(\omega-\epsilon_2)\langle\langle c_{2\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r} &= V_d^{*}\langle\langle c_{1\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r} \\ &+V_d\langle\langle c_{3\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r}+U_2\langle\langle c_{2\sigma}n_{2-\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r}\end{aligned}$$

(A.18)

$$\begin{aligned}(\omega-\epsilon_2)\langle\langle c_{2\sigma}, c_{3\sigma}^{\dagger}\rangle\rangle^{r} &= V_{\mathrm{d}}^{*}\langle\langle c_{1\sigma}, c_{3\sigma}^{\dagger}\rangle\rangle^{r} \\ &+V_d\langle\langle c_{3\sigma}, c_{3\sigma}^{\dagger}\rangle\rangle^{r}+U_2\langle\langle c_{2\sigma}n_{2-\sigma}, c_{3\sigma}^{\dagger}\rangle\rangle^{r}\end{aligned}$$

(A.19)

$$\begin{aligned}(\omega-\epsilon_3)\langle\langle c_{3\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r} &= V_d^{*}\langle\langle c_{2\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r} \\ &+U_3\langle\langle c_{3\sigma}n_{3-\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r}+V_p^{\mathrm{R}}\langle\langle b_{p\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r}\end{aligned}$$

(A.20)

$$\begin{aligned}(\omega-\epsilon_3)\langle\langle c_{3\sigma}, c_{2\sigma}^{\dagger}\rangle\rangle^{r} &= V_d^{*}\langle\langle c_{2\sigma}, c_{2\sigma}^{\dagger}\rangle\rangle^{r} \\ &+U_3\langle\langle c_{3\sigma}n_{3-\sigma}, c_{2\sigma}^{\dagger}\rangle\rangle^{r}+V_p^{\mathrm{R}}\langle\langle b_{p\sigma}, c_{2\sigma}^{\dagger}\rangle\rangle^{r}.\end{aligned}$$

Typesetting math: 100%

The Dyson equations for lead-dot GFs in series combination are

$$\langle\langle a_{k\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r} = V_{k1}^{\mathrm{L}*} g_{k}^{r} \langle\langle c_{1\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r}$$

and

$$\langle\langle b_{p\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r} = V_{p3}^{\mathrm{R}*} g_{k}^{\mathrm{r}} \langle\langle c_{3\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r}.$$

(e) *For the triple quantum dots in parallel*

$$\begin{aligned}(\omega - \epsilon_1)\,\langle\langle c_{1\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r} &= 1 + V_d \langle\langle c_{2\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r} \\ &+ U_1 \langle\langle c_{1\sigma} n_{1-\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r} + V_{k1}^{\mathrm{L}} \langle\langle a_{k\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r} \\ &+ V_{p1}^{\mathrm{R}} \langle\langle b_{p\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r}\end{aligned}$$

(A.22)

$$\begin{aligned}(\omega - \epsilon_2)\,\langle\langle c_{2\sigma}, c_{2\sigma}^{\dagger}\rangle\rangle^{r} &= 1 + V_d^{*} \langle\langle c_{1\sigma}, c_{2\sigma}^{\dagger}\rangle\rangle^{r} \\ &+ V_d \langle\langle c_{3\sigma}, c_{2\sigma}^{\dagger}\rangle\rangle^{r} + V_{k2}^{\mathrm{L}} \langle\langle a_{k\sigma}, c_{2\sigma}^{\dagger}\rangle\rangle^{r} \\ &+ U_2 \langle\langle c_{2\sigma} n_{2-\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle^{r} + V_{p2}^{\mathrm{R}} \langle\langle b_{p\sigma}, c_{2\sigma}^{\dagger}\rangle\rangle^{r}\end{aligned}$$

(A.23)

$$\begin{aligned}(\omega - \epsilon_3)\,\langle\langle c_{3\sigma}, c_{3\sigma}^{\dagger}\rangle\rangle^{r} &= 1 + V_d^{*} \langle\langle c_{2\sigma}, c_{3\sigma}^{\dagger}\rangle\rangle^{r} \\ &+ U_3 \langle\langle c_{3\sigma} n_{3-\sigma}, c_{3\sigma}^{\dagger}\rangle\rangle^{r} + V_{k3}^{\mathrm{L}} \langle\langle a_{k\sigma}, c_{3\sigma}^{\dagger}\rangle\rangle^{r} \\ &+ V_{p3}^{\mathrm{R}} \langle\langle b_{p\sigma}, c_{3\sigma}^{\dagger}\rangle\rangle^{r}\end{aligned}$$

(A.28)

Typesetting math: 100%

$$(\omega-\epsilon_2)\langle\langle c_{2\sigma},c^\dagger_{3\sigma}\rangle\rangle^r = V_d^*\langle\langle c_{1\sigma},c^\dagger_{3\sigma}\rangle\rangle^r + V_d\langle\langle c_{3\sigma},c^\dagger_{3\sigma}\rangle\rangle^r + U_2\langle\langle c_{2\sigma}n_{2-\sigma},c^\dagger_{3\sigma}\rangle\rangle^r + V^{\mathrm{R}}_{p2}\langle\langle b_{p\sigma},c^\dagger_{3\sigma}\rangle\rangle^r + V^{\mathrm{L}}_{k2}\langle\langle a_{k\sigma},c^\dagger_{3\sigma}\rangle\rangle^r \quad \text{(A.29)}$$

$$(\omega-\epsilon_3)\langle\langle c_{3\sigma},c^\dagger_{2\sigma}\rangle\rangle^r = V_d^*\langle\langle c_{2\sigma},c^\dagger_{2\sigma}\rangle\rangle^r + U_3\langle\langle c_{3\sigma}n_{3-\sigma},c^\dagger_{2\sigma}\rangle\rangle^r + V^{\mathrm{L}}_{k3}\langle\langle a_{k\sigma},c^\dagger_{2\sigma}\rangle\rangle^r + V^{\mathrm{R}}_{p3}\langle\langle b_{p\sigma},c^\dagger_{2\sigma}\rangle\rangle^r \quad \text{(A.30)}$$

$$\left(\omega-\epsilon_1-n_1U_1-i\frac{\Gamma_{11}}{2}\right)\langle\langle c_{1\sigma},c^\dagger_{1\sigma}\rangle\rangle^r = 1+V_d\langle\langle c_{2\sigma},c^\dagger_{1\sigma}\rangle\rangle^r + i\frac{\Gamma_{12}}{2}\langle\langle c_{2\sigma},c^\dagger_{1\sigma}\rangle\rangle^r + i\frac{\Gamma_{13}}{2}\langle\langle c_{3\sigma},c^\dagger_{1\sigma}\rangle\rangle^r \quad \text{(A.31)}$$

$$\left(\omega-\epsilon_2-n_2U_2-i\frac{\Gamma_{22}}{2}\right)\langle\langle c_{2\sigma},c^\dagger_{1\sigma}\rangle\rangle^r = V_d\langle\langle c_{1\sigma},c^\dagger_{1\sigma}\rangle\rangle^r + i\frac{\Gamma_{21}}{2}\langle\langle c_{1\sigma},c^\dagger_{1\sigma}\rangle\rangle^r \quad \text{(A.32)}$$

$$\left(\omega-\epsilon_3-n_3U_3-i\frac{\Gamma_{33}}{2}\right)\langle\langle c_{3\sigma},c^\dagger_{3\sigma}\rangle\rangle^r = 1+V_d\langle\langle c_{2\sigma},c^\dagger_{3\sigma}\rangle\rangle^r + i\frac{\Gamma_{32}}{2}\langle\langle c_{2\sigma},c^\dagger_{3\sigma}\rangle\rangle^r. \quad \text{(A.33)}$$

The EOM for lead-dot coupling GFs are given by following Dyson equations:

$$\begin{aligned}\langle\langle a_{k\sigma},c^\dagger_{1\sigma}\rangle\rangle^r =& V^{\mathrm{L}*}_{k1}g^r_k\langle\langle c_{1\sigma},c^\dagger_{1\sigma}\rangle\rangle^r + V^{\mathrm{L}*}_{k2}g^r_k\langle\langle c_{2\sigma},c^\dagger_{1\sigma}\rangle\rangle^r + V^{\mathrm{L}*}_{k3}g^r_k\langle\langle c_{3\sigma},c^\dagger_{1\sigma}\rangle\rangle^r\\ \langle\langle b_{p\sigma},c^\dagger_{1\sigma}\rangle\rangle^r =& V^{\mathrm{R}*}_{p1}g^r_k\langle\langle c_{1\sigma},c^\dagger_{1\sigma}\rangle\rangle^r + V^{\mathrm{R}*}_{p2}g^r_k\langle\langle c_{2\sigma},c^\dagger_{1\sigma}\rangle\rangle^r + V^{\mathrm{R}*}_{p3}g^r_k\langle\langle c_{3\sigma},c^\dagger_{1\sigma}\rangle\rangle^r.\end{aligned}$$

The GFs of QDs in various configurations can be obtained by using the simplest mean-field approximation, such that GFs of the type $\langle\langle c_{i\sigma}n_{i-\sigma},c^\dagger_{j\sigma}\rangle\rangle^r \approx n_{i-\sigma}\langle\langle c_{i\sigma},c^\dagger_{j\sigma}\rangle\rangle^r$ and hierarchy of GFs in the above EOMs get closed to the final forms of the respective GFs.

Appendix B

1.1 B.1 Current

To discuss the method for deriving relation for the total current, we take

Typesetting math: 100%

the case of parallel double quantum dot system. The expression for the current due to the left lead is

$$I_{\mathrm{L}} = \frac{e}{h}\sum_{ki\sigma}\int\left(V_{ki}^{\mathrm{L}}\langle\langle a_{k\sigma}, c_{i\sigma}^{\dagger}\rangle\rangle_{\omega}^{<} - V_{ki}^{\mathrm{L}*}\langle\langle c_{k\sigma}, a_{i\sigma}^{\dagger}\rangle\rangle_{\omega}^{<}\right)\mathrm{d}\omega \quad (i=1,2).$$

(B.1)

Similarly, the current due to the right lead can be written as

$$I_{\mathrm{R}} = \frac{e}{h}\sum_{pi\sigma}\int\left(V_{pi}^{\mathrm{R}}\langle\langle b_{p\sigma}, c_{i\sigma}^{\dagger}\rangle\rangle_{\omega}^{<} - V_{pi}^{\mathrm{R}*}\langle\langle c_{k\sigma}, b_{i\sigma}^{\dagger}\rangle\rangle_{\omega}^{<}\right)\mathrm{d}\omega \quad (i=1,2).$$

(B.2)

The Dyson equations for the GFs appearing in these expressions are

$$\begin{aligned}
&\langle\langle a_{k\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle_{\omega}^{<}\\
&\quad = V_{k1}^{\mathrm{L}*}g_k^r\langle\langle c_{1\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle_{\omega}^{<} + V_{k1}^{\mathrm{L}*}g_k^{<}\langle\langle c_{1\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle_{\omega}^{a}\\
&\qquad + V_{k2}^{\mathrm{L}*}g_k^r\langle\langle c_{2\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle_{\omega}^{<} + V_{k2}^{\mathrm{L}*}g_k^{<}\langle\langle c_{2\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle_{\omega}^{a}\\
&\langle\langle a_{k\sigma}, c_{2\sigma}^{\dagger}\rangle\rangle_{\omega}^{<}\\
&\quad = V_{k2}^{\mathrm{L}*}g_k^r\langle\langle c_{2\sigma}, c_{2\sigma}^{\dagger}\rangle\rangle_{\omega}^{<} + V_{k2}^{\mathrm{L}*}g_k^{<}\langle\langle c_{2\sigma}, c_{2\sigma}^{\dagger}\rangle\rangle_{\omega}^{a}\\
&\qquad + V_{k1}^{\mathrm{L}*}g_k^r\langle\langle c_{1\sigma}, c_{2\sigma}^{\dagger}\rangle\rangle_{\omega}^{<} + V_{k1}^{\mathrm{L}*}g_k^{<}\langle\langle c_{1\sigma}, c_{2\sigma}^{\dagger}\rangle\rangle_{\omega}^{a}\\
&\langle\langle c_{1\sigma}, a_{k\sigma}^{\dagger}\rangle\rangle_{\omega}^{<}\\
&\quad = V_{k1}^{\mathrm{L}}g_k^{<}\langle\langle c_{1\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle_{\omega}^{r} + V_{k1}^{\mathrm{L}}g_k^{a}\langle\langle c_{1\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle_{\omega}^{<}\\
&\qquad + V_{k2}^{\mathrm{L}}g_k^{<}\langle\langle c_{2\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle_{\omega}^{r} + V_{k2}^{\mathrm{L}}g_k^{a}\langle\langle c_{2\sigma}, c_{1\sigma}^{\dagger}\rangle\rangle_{\omega}^{<}\\
&\langle\langle c_{2\sigma}, a_{k\sigma}^{\dagger}\rangle\rangle_{\omega}^{<}\\
&\quad = V_{k2}^{\mathrm{L}}g_k^{<}\langle\langle c_{2\sigma}, c_{2\sigma}^{\dagger}\rangle\rangle_{\omega}^{r} + V_{k2}^{\mathrm{L}}g_k^{a}\langle\langle c_{2\sigma}, c_{2\sigma}^{\dagger}\rangle\rangle_{\omega}^{<}\\
&\qquad + V_{k1}^{\mathrm{L}}g_k^{<}\langle\langle c_{1\sigma}, c_{2\sigma}^{\dagger}\rangle\rangle_{\omega}^{r} + V_{k1}^{\mathrm{L}}g_k^{a}\langle\langle c_{1\sigma}, c_{2\sigma}^{\dagger}\rangle\rangle_{\omega}^{<}\\
&I_{\mathrm{L}} = \frac{e}{h}\sum_{\sigma}\int i\mathrm{Tr}\left[\Gamma^{\mathrm{L}}G^{<} + f_{\mathrm{L}}\Gamma^{\mathrm{L}}(G^r - G^a)\right]\mathrm{d}\omega
\end{aligned}$$

(B.3)

$$I_{\mathrm{R}} = \frac{e}{h}\sum_{\sigma}\int i\mathrm{Tr}\left[\Gamma^{\mathrm{R}}G^{<} + f_{\mathrm{R}}\Gamma^{\mathrm{R}}(G^r - G^a)\right]\mathrm{d}\omega.$$

(B.4)

Further,

$$I = I_{\mathrm{L}} = -I_{\mathrm{R}} = \frac{I_{\mathrm{L}} - \mathrm{I}_{\mathrm{R}}}{2}.$$

The total current in the couple quantum dots is

$$\begin{aligned}
I = &\frac{ie}{2h}\sum_{\sigma}\int\mathrm{Tr}\left[\left(\Gamma^{\mathrm{L}} - \Gamma^{\mathrm{R}}\right)G^{<}\right.\\
&\left.+(\Gamma^{\mathrm{L}}f_{\mathrm{L}} - \Gamma^{\mathrm{R}}f_{\mathrm{R}})(G^r - G^a)\right]\mathrm{d}\omega.
\end{aligned}$$

(B.5)

Typesetting math: 100%

te case

$$\Gamma^{\mathrm{L}} = \lambda \Gamma^{\mathrm{R}} \quad \text{and} \quad x = \frac{1}{1+\lambda}.$$

The current can be written as $I = xI_{\mathrm{L}} - (1-x)I_{\mathrm{R}}$. Hence,

$$I = \frac{ie}{h} \sum_{\sigma} \int (f_{\mathrm{L}} - f_{\mathrm{R}}) \times \mathrm{Tr}\left[\left(\frac{\Gamma^{\mathrm{L}}\Gamma^{\mathrm{R}}}{\Gamma^{\mathrm{L}} - \Gamma^{\mathrm{R}}}\right)(G^r - G^a)\right] \mathrm{d}\omega. \tag{B.6}$$

Also, by making use of the identity $G^r - G^a = -i\left(\Gamma^{\mathrm{L}} - \Gamma^{\mathrm{R}}\right) G^r G^a$, the expression for the total current leads to the following well-known Landauer–Buttiker current formula:

$$I = \frac{e}{h} \sum_{\sigma} \int (f_{\mathrm{L}} - f_{\mathrm{R}}) \, \mathrm{Tr}\left(G^a \Gamma^{\mathrm{R}} G^r \Gamma^{\mathrm{L}}\right) \mathrm{d}\omega = \frac{e}{h} \sum_{\sigma} \int (f_{\mathrm{L}} - f_{\mathrm{R}}) \, T(\omega) \, \mathrm{d}\omega. \tag{B.7}$$

A Stanene quantum dot in triangular shape has been investigated within the Density Functional Theory. The effect of edge passivationwith hydrogen, fluorine and chlorine atoms on electronic and optical properties has been explored. We observed that HOMO-LUMO energy gap in functionalized structures varies from 0.33 eV to 0.27eV and magnetic moment variation from 2.52 μ_B to 1.98μ_B. In dielectric function, red shift is observed for halogens(-F, -Cl) passivation comparative to hydrogenation and plasmons lie in infrared region of frequency spectrum.

Topics

HOMO and LUMO, Density functional theory, First-principle calculations, Plasmons, Magnetic dipole moment, Optical properties, Quantum dots, Topological insulator, Hydrogenation process

Abstract

The present study investigates the behaviour of helical soil-nailed wall in a dry cohesionless medium under static and seismic conditions. Initially, results from laboratory pullout tests are used to develop a pullout capacity equation, which is subsequently used for stability analysis of helical soil-nailed wall. A detailed parametric study is conducted to evaluate the effect of angle of internal friction of soil, nail inclination, vertical spacing of nails, number of nails, helix size, number of helices, and the face angle on the stability of the soil-nailed wall. Results from the present method are compared and validated with similar existing methods available in the literature. The results suggest that for the given input parameters, the factor of safety (FoS) values from the present method are lower than the pseudo-static and pseudo-dynamic values. Further, the study clearly highlights the significance of input excitation frequency on the FoS of helical soil-nailed walls. In addition, the effects of strain-dependent dynamic properties (shear modulus and damping ratio) on the stability of helical soil-nailed walls are studied using the newly proposed equivalent linear analysis approach. The results computed from the proposed linear and equivalent linear analysis are also compared and discussed in detail.

Résumé

La présente étude examine le comportement des parois hélicoïdales clouées au sol dans un milieu sec et sans cohésion dans des conditions statiques et sismiques. Initialement, les résultats des tests d'arrachement en laboratoire sont utilisés pour développer l'équation de la capacité d'arrachement, qui est ensuite utilisée pour l'analyse de stabilité des parois hélicoïdales clouées au sol. Une étude paramétrique détaillée est menée pour évaluer l'effet de l'angle de frottement interne du sol, l'inclinaison des clous, l'espacement vertical des clous, le nombre de clous, la taille de l'hélice, le nombre d'hélices et l'angle du visage sur la stabilité du mur cloué au sol. Les résultats de la présente méthode sont comparés et validés avec les méthodes similaires existantes dans la littérature. Les résultats suggèrent que, pour les paramètres d'entrée donnés, les valeurs du facteur de sécurité (« FoS ») de la méthode actuelle sont inférieures aux valeurs pseudo-statiques et pseudo-dynamiques. En outre, l'étude souligne clairement l'importance de la fréquence d'excitation d'entrée sur le FoS des murs hélicoïdaux cloués au sol. En outre, l'effet des propriétés dynamiques dépendantes de la contrainte (module de cisaillement et rapport d'amortissement) sur la stabilité des murs cloués hélicoïdaux de sol est étudié à l'aide de la nouvelle méthode d'analyse linéaire équivalente proposée. Les résultats calculés à partir de l'analyse linéaire et de l'analyse linéaire équivalente proposée sont également comparés et discutés en détail. [Traduit par la Rédaction]

Abstract

Pullout and direct shear (DS) tests are most commonly used to measure the interface shear strength parameters required for soil–nail design. This paper investigates the effect of the surface roughness, and relative density (RD) and installation process on interface shear behaviour between the groutless soil nail and dry sand medium through laboratory pullout and DS interface tests. The test procedure and the interface shear results obtained from pullout tests are discussed and compared with that obtained from DS tests besides the existing literature. The study shows that in the pre-peak stage, the shear stress–displacement behaviour obtained from interface shear tests is similar to pullout tests and soil–soil DS tests. However, in the post-peak stage, the behaviour is similar to soil–soil DS tests but different from pullout tests. The interface shear stress behaviour of soil nail is significantly influenced by the installation process, RD of soil sample and surface roughness of the soil nail.

Abstract:

Silicon photonic devices used in the photonics industry over the past three decades have helped in realizing large-scale photonic integrated circuits. Silicon nitride (Si_3N_4) is another CMOS-compatible platform that provides several advantages such as low loss, high optical power tolerance, and broad spectral operation band from visible to infrared wavelengths. Recently, the combination of Si_3N_4 waveguide technology with silicon photonics and III-V materials has opened up new areas in on-chip applications. Researchers in the field are primarily focusing on its applications such as on-chip gas sensing, nonlinear optical signal processing, and label-free biosensors based on photonic integrated circuits. In this review paper, we discuss Si_3N_4 material-based platforms for a variety of applications with devices ranging from passive to active and hybrid photonic devices.

ABSTRACT

In the present study, a model is proposed for the sizing optimization of a hybrid renewable energy system (HRES) based on local resource assessment and demand side management (DSM). It involves resource estimation for both micro hydro and solar photovoltaic systems. The sizing optimization of the HRES with or without load shifting based DSM is carried out using PSO (particle swarm optimization) and BBO (biogeography-based optimization) techniques. The purpose of DSM is to reduce the peak hourly power consumption. The cycle charging dispatch strategy has been used for sizing optimization of HRES. A comparative analysis has been made for PSO and BBO algorithms, by keeping energy index ratio at 1. Based on demand side management, the cost of energy, net present cost, renewable fraction, and emissions of carbon dioxide from diesel generators are also calculated. The results show that HRES with diesel generator (DG) of (10 kW), solar photovoltaic system (SPV) of (0.3 kW), and batteries of (300 Ah) each are most cost effective in the present scenario. This HRES combination consists of 4 units of DGs, 184 units SPV, and 44 units battery possesses 95.31% of renewable fraction during load

Notes on contributors

Sanjay Kumar

Sanjay Kumar has 5 years of teaching experience at NITs and government institutes. His area of research includes Power System, Renewable Energy, Network Planning, Microgrid, Optimization, GIS and Machine Learning. He has published a number of research papers in various journals and conferences.

Tarlochan Kaur

Dr. (Mrs) Tarlochan Kaur received her B.E (Honours), M.E and Ph.D. degree in Electrical Engineering from PEC University of Technology, Chandigarh. Her area of research interest includes Electromagnetic Fields, Power systems and Renewable Energies, Power electronics. She has published research papers in various Journals, International and National conferences. She is currently working as Professor in Electrical Engineering Department at PEC University of Technology, Chandigarh.

Electronics Engineering from Birla Institute of Technology, Mesra, India in 2012 and PhD. from the Indian Institute of Technology, Roorkee, India in August 2017. He is currently working as a Faculty member at Dayalbagh Educational Institute, Agra. His research interests include integrated renewable energy system, power quality, power electronics applications in renewable energy, artificial intelligence techniques and optimization.

Vivek Sharma

Vivek Sharma has 9 years of teaching and research experience at various institutes. He is working as an assistant professor in the Electrical Engineering Department at NIT Jalandhar. His area of research includes Control System, Nonlinear Control, Observer design.

Deven Vatsal

Deven Vatsal received his B. Tech. from PTU and ME degree in Electrical Engineering from NIT Hamirpur in August 2011. He is currently pursuing his PhD from NIT Jalandhar. His research interests include integrated renewable energy, microgrid, condition and monitoring of electrical equipment and optimization.

Abstract

The outbreak of COVID 19 among community is a threat to society. The world is still looking for its vaccine in the market due to rapid growth in positive cases. The shutdown of essential service in global market due to COVID-19 has produced a threat to economic security and society growth. In present study, SEIR (Susceptible, Exposed, Infectious and Recovered) model using ode45 solver has been developed for prediction of number of COVID-19 cases that could possibly be there in India in next 227 days. The impact of COVID-19 cases with and without and preventive care has been predicted with proposed model. The effect of reproductive number (R) in respect to preventive care has also been analysed.

Highly sensitive and reusable Cu^{+2}/polyaniline/reduced graphene oxide nanocomposite ink-based non-enzymatic glucose sensor

Vijay Kumar Anand, Archana Bukke, Kapil Bhatt, Sandeep Kumar, Sandeep Sharma, Rakesh Goyal & G. S. Virdi

Applied Physics A **126**, Article number: 500 (2020)

497 Accesses | **12** Citations | Metrics

Abstract

The present work focuses on the preparation and characterizations of a highly sensitive, reusable, linear, anti-interferent, and low-cost Cu^{+2}/polyaniline (PANI)/reduced graphene oxide (rGO) nanocomposite ink-based non-enzymatic glucose (NEG) sensor. The synergistic properties of Cu^{+2}/PANI and rGO result in a large number of electrochemically active and stable sites which catalytically favored the glucose oxidation. The crystal structure and morphology of PANI, Cu^{+2}/PANI composite, and Cu^{+2}/PANI/rGO nanocomposite ink encouraged the usefulness of Cu^{+2}/PANI/rGO nanocomposite ink as an electrocatalyst in NEG detection. A NEG sensor was prepared by drop coating Cu^{+2}/PANI/rGO nanocomposite ink on a low-cost patterned FR4 electrode. The cyclic voltammetry and chronoamperometry tests were performed to estimate the electrochemical behavior of prepared Cu^{+2}/PANI/rGO/FR4 NEG sensor. The electrooxidation of glucose was achieved at an applied potential of 0.66 V. An anti-interferent Cu^{+2}/PANI/rGO/FR4 NEG sensor demonstrated a linear response in two different glucose concentration regimes 2.8–22.2 μM and 0–4 mM with current sensitivity of 4168.37 μA mM^{-1} cm^{-2} and 525.4 μA mM^{-1} cm^{-2}, respectively. The prepared sensor displayed a limit of detection (LOD) of 4.93 μM with a response time of < 5 s. The excellent performance parameters of the Cu^{+2}/PANI/rGO/FR4 NEG sensor recommend its relevance in human serum samples. These values of operating voltage, current sensitivity, linear range, LOD and anti-interference ability promise its usefulness in practical applications.

High-performance ultra-low leakage current graphene-based screen-printed field-effect transistor on paper substrate

Kapil Bhatt, Sandeep Kumar & C C Tripathi

Pramana **94**, Article number: 31 (2020)

429 Accesses | **10** Citations | Metrics

Abstract

Exploiting the advantages of additive patterning process over complex fabrication processes, herein we report the fabrication of field-effect transistor (FET) using the screen-printing method. The graphene conductive composite dielectric ink as the channel and the dielectric layer respectively was screen printed on cellulose paper substrate. The fabricated device shows the hole and electron mobility of 135 \(\hbox {cm}^{2}/\)V s and 98 \(\hbox {cm}^{2}/\)V s respectively with an ultra-low leakage current of \(\sim \)25 nA. The proposed technique can be used for large-scale roll-to-roll commercial manufacturing of disposable FET-based sensors such as temperature and IR sensors, health monitoring devices etc.

Impact of Triple Roll Milling Processing Parameters on Fluidic/Rheological and Electrical Properties of Aqueous Graphene Ink

Sandeep Kumar, Pramod Kumar, Kapil Bhatt, Shilpi Shrivastva, Amit Kumar, Ravinder Singh, Rajesh Punia, Chandra Charu Tripathi

First published: 17 December 2019 | https://doi.org/10.1002/adem.201901187 | Citations: 5

Abstract

Graphene ink is a potential candidate for the printing of electronic devices. Rheological studies of graphene inks are necessary to estimate and tune the behavior of ink during and after printing. Ink constituents and their fundamental properties play an important role in modifying the rheological behavior of ink. During the processing of ink, modification of these properties takes place. So, it is quite important to investigate the role of processing equipment on the ink constituents and correspondingly on the rheological behavior of ink and printed functional devices. Herein, graphene ink formulation through a triple roll mill (TRM) is presented. The particle size of graphene ink reduces substantially with both the speed of rollers and number of passes. Approximately 52% reduction in particle size is observed after five passes at the highest roller speed, and it further reduces up to 72% with an increase in the number of passes. Correspondingly, solvent loss, density, and viscosity of the inks are observed in respect of roller speed and number of passes. The impact of TRM parameters on ink constituents, rheology, and electrical properties of screen-printed resistors is discussed and explained in terms of simple analytical models.

Abstract:

With the advent of distributed generation (DG), the need for efficient power electronic converter is increasing as the incorporation of renewables with battery unit and loads rely heavily on them. This paper suggests an original structure of high-gain DC to DC converter named as “Two-Tier converter” with the reduction in voltage stress. The configuration is resultant of stacking two-stage of the classical boost converter. The voltage gain offered is high for even lower values of duty cycle as the relation of gain is quadratic. Also, the converter current at the input is continuous, and the load configuration offered is grounded. Analysis and operational modes of the proposed converters and effect of the effective series resistance of inductors on voltage gain are presented in detail. A comparative analysis of suggested and new high-gain converters is presented in detail. The suggested configuration is confirmed using detailed simulation studies.

I. Introduction

Distributed generation (DG) penetration at both low and medium (LV and MV) is increasing worldwide [1]. DG application has key potentials at reducing carbon emissions as it promotes renewables like solar modules, small turbines for wind energy, fuel cells, etc. [2]. Also, DG setup has generation close to the end-users that leads to reliability and power quality improvement of electric supply [3]. DG design and operation require new interfacing technologies primarily because of

intermittent nature and low level of the terminal voltage of renewable energy sources [4]. Need for efficient DC-DC converters having high voltage gain is one of them. The conventional boost, buck-boost converter configurations can provide a high voltage level at the output; however, efficiency is severely affected as duty ratio approaches unity mainly due to increased conduction losses of switches [5]. Thus, to increase the voltage gain ratio with improved performance and efficiency, several configurations suggested in the available theory [6]–[7]. The converter topologies with transformers achieve high voltage level, but they face low-efficiency issues due to the leakage inductance, which induces high voltage and thus, significant switching losses problems. Also, apart from industrial applications, transformer use in converters adds to the cost and size and reduces efficiency. Further, converters with coupled inductors were introduced that able to achieve a high voltage gain, but they suffer from the same leakage inductance issue and a large-size spike in current. Moreover, the additional clamping circuit, with filters circuitry associated with these converters, and which makes circuit complex and costly [7].

Abstract:

In DC microgrid, the combination of energy source, especially renewable with the unit for storage and utility load rely heavily upon the electronics power converters. This paper proposes a novel DC to DC converter called Quad-Switched-Inductor Double-Switch (QSI-DS) converter for microgrid voltage step-up applications. The non-isolated topology utilizes Quad-Switched-Inductors network to develop to proposed converter configuration to achieve high voltage gain. Two switches used to control the flow of energy from input to the output of the converter. Reduced voltage stress across the switches and high gain are the merits of the proposed converter in this work. Principle of operation for continuous, and discontinues modes of the suggested converter, also elaborated. Analysis for gain calculation, comparison with recently suggested converters is presented. The theoretical analysis and performance of the suggested topology of converter validated through Simulink model.

I. Introduction

Recently, the growing concerns over greenhouse gas emissions and reduction in fossil fuel reserves have led to increased interest and attention towards renewable energy sources. Renewable energy sources offer considerable promises of an efficient, reliable and environment-friendly electric system [1]. Solar photovoltaic (PV) is one that gaining popularity because of the abundance of solar

irradiation, its inexhaustible potential, its increasingly competitive cost and environmental benefits [2]. But the penetration of renewables as distributed generation sources at the distribution level causes issues like excessive voltage rise, increase in the fault level, power quality issues, etc. Recently, DC microgrid has progressed as a reliable mode of the power distribution network as it agreements a natural interface to DC energy sources, storage units for energy, and utility loads when compared to AC grid [3]. Fig. 1 depicts a schematic layout of 400 V microgrid (DC) consisting of solar PV as renewable energy sources, battery as an energy storage device and loads systems connected to a universal DC bus through DC-DC and DC-AC converters. Various configurations have been proposed in the literature for DC distribution systems [4]–[5]. The main issues lie at a low level and intermittent nature of the terminal voltage of PV modules. PV panels are connected in series to boost the output voltage, which consequences in a dip in efficiency increased cost and size of the system.

Metadata

Abstract:

To mitigate the voltage transfer gain issue of the classical power converters, an isolated boost converter can be a solution. However, it increases the power circuit dimension and expense due to the involvement of many coupled inductors and transformer. In this treatise, a 3Nx DC-DC converter is proposed for high voltage gain application. High voltage transfer gain is obtained by suggested converters and circuitry is derived from two multistage converters (one inverting and second non-inverting) by connecting them. In more specific, 3Nx power converter fusing the characteristics of 2Nx power converter and Nx DC-DC converter, where voltage multiplier and switched inductor cells are used to improve voltage gain. By doing this, the 3Nx power converter generates the voltage transfer gain 3N times higher than the simple boost power converter, where N is several stages in the suggested power converter. The magnitudes of DC voltage can be increased with more number of stages to make renewable energy resources appropriate at the user level. The operation, voltage gain derivation, comparison with recent converter, simulation study are given. The obtained results are closely matched with mathematical analysis and approve the operation of the 3Nx power converter.

I. Introduction

Recent years have seen the exponential development of renewable energies, including wind, solar,

Sign in to Continue Reading

mare, biomass etc. The abundance of energy produced means that among other highly agreed and most allowed sources [1]–[4], solar energy is the main source of energy output. The output voltages are relatively modest for clean sources, including photovoltaic (PV) arrays. However, a high voltage DC bus is required for the grid. Although these renewables have comparatively low voltage performance characteristics, they require substantial incremental voltage gains and high-quality DC-DC converters. The DC-DC boost converter provided the photovoltaic panel step-up voltage with the requisite value for the inverter to inject energy into the grid [5]–[6] to solve this serious issue. As seen in Fig. 1(a) the typical boost converter could achieve an infinite voltage conversion ratio according to theoretical. The simple converter is, however, an inefficient solution for high duty cycles, provided that the ESR series equal resistance, an issue with diode recovery, etc., limits the boost ratio and makes the transformer unstable [7]. The existence of passive components such as condensers and inductor, which do not discharge in such situations will be unstable. Cascade converters may be a workaround for high voltage gains, but the voltage and current of the converter switches are not homogeneous. It also increases the number and complexity of the semi-conducting switches by reducing the device performance [7]–[8]. Isolated converters help solve problems, but isolated converter topologies make the control circuit voluminous and expensive [7]–[10]. Several recent topologies were determined to reach high transfer gain without the transformer values or service cycles being overexploited.

Abstract:
Nowadays, power quality becomes an essential concern in the field of power system networks due to the use of sensitive devices. The problem associated with power quality is voltage sag, damage to power equipment, product quality degradations, voltage swell, etc. But one of the severe disturbances in the power system is the problem of voltage sag. To mitigating these disturbances, the use of custom power devices or FACTS devices with the help of power electronic devices is presented. Hence an economical and proficient power device called as the Series Compensator Circuit (SCC) is employed in power distribution networks. This device helps in injecting the voltage in synchronism with the standard system voltage to compensate the voltage influences in the situation of voltage disturbance. This article deals with modelling, methodology and simulation of a Series Compensator Circuit (SCC). A simulation is modelled using MATLAB/Simulink. The simulation results are presented, which validates the functionality and the concept effectively.

I. Introduction

Modern-day household and industrial appliances are too much sensitive to power quality irregularities. Factors like voltage magnitude, frequency and wave-shape primarily define the power quality. The IEEE standards categorize the irregularities of power quality into seven types based on

Accept & Close

waveshape as transients, interruptions, under-voltage or voltage sag, over-voltage or voltage swell, waveform distortion, voltage fluctuations, and frequency variations. The widely prevailing irregular state is voltage sag which majorly affects the sensitive loads. From IEEE 519–1992 and IEEE 1159–1995 standards it can be stated that, in the period of voltage sag, RMS voltage might fall from 10 to 90 per cent of rated voltage and able to withstand for the extent of 0.5 to 30 cycles [1]. Likewise, in the period of voltage swell, RMS voltage might increase from 10 to 80% of rated voltage and able to withstand, for an extent of 0.5 to 30 cycles [2]. The series connection of SCC in the power line ahead of the sensitive load guards the load against voltage instabilities [3].

Abstract | References | Citations | Supplementary Data | Suggestions

Breast cancer is one of the common malignant diseases in female all over the world. Microscopic investigation of tissues in breast is essential for analysis of breast cancer. For detection of breast cancer, pathologist uses various magnificent stages for obtaining accurate diagnosis of biopsy images which is time consuming. Development in digital imaging techniques has helped in assessment of pathology images using machine learning and computerized methods which could computerize a few of the pathology stages in the diagnosis of breast cancer. This kind of automation can be helpful in achieving quick and exact results reducing the observers' inconsistency, thus increasing the accuracy. In this work, a new method is proposed to categorize breast cancer histopathology images. The objective is to evaluate the robustness and accuracy of a classification system based on machine learning, to automatically identify invasive tumor on digitized images without extracting the features. Here, a new method is presented that employs machine learning classifiers for classification of invasive tumor on whole slide images. The accuracy of different classifiers varies from 80% to 85%, leaving scope for improvement. The aim is to gather different researchers in both machine learning and medical field to proceed toward this Computer Aided Diagnosis (CAD) system for classification of invasive ductal carcinoma (IDC).

Abstract

Combination of classical and statistical approaches to enhance the fermentation conditions and increase the yield of Lipopeptide(s) by Pseudomonas sp. OXDC12: its partial purification and determining antifungal property

Abstract

Around 200 different lipopeptides (LPs) have been identified to date, most of which are produced via *Bacillus* and *Pseudomonas* species. The clinical nature of the lipopeptide (LP) has led to a big surge in its research. They show antimicrobial and antitumor activities due to which mass-scale production and purification of LPs are beneficial. Response surface methodology (RSM) approach has emerged as an alternative in the field of computational biology for optimizing the reaction parameters using statistical models. In the present study, *Pseudomonas* sp. strain OXDC12 was used for production and partial purification of LPs using Thin Layer Chromatography (TLC). The main goal of the study was to increase the overall yield of LPs by optimizing the different variables in the fermentation broth. This was achieved using a combination of one factor at a time (OFAT) and response surface methodology (RSM) approaches. OFAT technique was used to optimize the necessary parameters and was followed by the creation of statistical models (RSM) to optimize the remaining variables. Maximum mycelial growth inhibition (%) against the fungus Mucor sp. was 61.3% for LP. Overall, the combination of both OFAT and RSM helped in increasing the LPs yield by 3 folds from 367mg/L to 1169mg/L.

Keywords: Fermentation; TLC; antifungal activity; optimization; purification; statistical evaluation.

Purification and characterization of actinidin from *Actinidia deliciosa* and its utilization in inactivation of α-amylase

Vivek Kumar Dhiman[1], Vivek Chauhan[1], Shamsher Singh Kanwar[1], Devendra Singh[2*] and Himanshu Pandey[3]

Abstract

Background: Actinidin is an anionic thiol-proteinase predominant and unique to Chinese gooseberry or kiwifruit, whose strong digestibility enables proteins or enzymes vulnerable to digestion. The arrangement of active cysteine–thiol residues (Cys22-Cys65, Cys56-Cys98, and Cys156-Cys206) stabilizes the catalytic unit, thus allowing an effective Inhibition of α-amylase protein on exposure to the highest concentrations of actinidin under optimum conditions. When starch-rich foods are consumed with kiwifruit, starch digestion may be slowed by the inactivation of α-amylase (digestive enzyme), specifically reducing the blood sugar levels by hindering starch digestion that is helpful in diabetes mellitus. Thus, the study aimed at actinidin purification, optimization for maximal activity, and its demonstration as a potential to degrade α-amylase.

Results: Protease showed a molecular mass of 27 kDa on SDS-PAGE analysis. One factor at a time method was applied for process optimization, increasing the actinidin yield up to 176.03 U/mg. The enzyme was stable at a wide pH range; however, it was most active and stable at pH 7.5. The enzyme possessed half-life at 35 °C of 5.5 h, at 40 °C of 4.5 h, at 45 °C of 2.5 h, and at 50 °C of 1 h. Lineweaver–Burk plot showed Michaelis–Menten constant (*Km*: 3.14 mg/ml) and maximal velocity (*Vmax*: 1.428 mmol/ml/min) using casein. The actinidin activity was enhanced with Ca^{2+} while it was inhibited by Cd^{2+} and Hg^{2+} ions. The α-amylase protein was successfully inactivated upon incubation with actinidin for 30 min; around ~ 85% of the α-amylase activity diminished. IC_{50} for inhibition of α-amylase was 2.54 mg/ml for crude actinidin and 1.86 mg/ml for purified actinidin.

Conclusions: Purified Actinidin showed a 1.28-fold increase in proteolytic activity. The proteinase showed an active pH range of 3.5–8.5 under varied buffer conditions and thermostability up to 50 °C. The results revealed a significant potential utility of actinidin to retard amylase as it effectively degraded the amylolytic enzyme under in vitro conditions and could be beneficial for lowering glycemic response to ingested starch. However, further in vitro as well as in vivo studies need to be conducted under gastrointestinal conditions to establish the hypothesis.

Keywords: Kiwifruit, *Actinidia deliciosa*, actinidin, SDS-PAGE, MALDI–TOF MS, Characterization, α-amylase

Background

Proteases have a key role in basic research because of their specificity to cleave peptide bonds used to elucidate protein sequence and structure. Commercially important proteases are obtained from a wide variety of living organisms (Baker et al. 1980). Kiwifruit belongs to the genus *Actinidia* and is a good source of actinidin protease. Actinidin is a plant-derived protease unique to *Actinidia sp.* It belongs to the cysteine or thiol protease

Highlights

- The purified RNase exhibited a very low (0.3 mM) and high V_{max} (9.2 μmol/mg/min)
- The enzyme was stable over wide range of pH and temperature

Optimization of culture conditions for extracellular cholesterol oxidase production from *Castellaniella* sp. for cholesterol conversion to 4-cholesten-3-one

Devi Sunita, Chauhan Vivek and Kanwar Shamsher S.*
Department of Biotechnology, Himachal Pradesh University, Summer Hill, Shimla-171 005, INDIA
*kanwarss2000@yahoo.com

Abstract

Cholesterol oxidase (CHOx) production by a new isolate characterized as Castellaniella sp. was studied in different fermentation conditions. The effects of various medium components and physicochemical conditions included production profile, inoculum size, inoculum age, carbon source, nitrogen source (organic and inorganic), surfactants, pH and temperature on extracellular CHOx production.

The maximum CHOx production was observed after 62 h of production time with 8.0%, v/v inoculum size with optimized fermentation medium containing cholesterol (0.1%, w/v), yeast extract (0.5%, w/v) and Triton X-100 (0.2%, v/v). The optimum pH and temperature for maximum CHOx production were found to be 8.0 and 35°C respectively. The classical "one-factor-at-a-time" approach increased CHOx activity of Castellaniella sp. from 0.067 U/ml to 0.396 U/ml, indicating 5.9-fold enhancement. Cholesterol biotransformation of 73± 3.0% to 4-cholesten-3-one was achieved by using enzyme solution/ n-decane biphasic system after 3 h of reaction by using 0.2% (w/v) cholesterol. The bioconversion was confirmed by TLC, HPLC and FTIR analysis of synthesized 4-cholesten-3-one.

Keywords: Cholesterol oxidase, 4-cholesten-3-one, bioconversion, *Castellaniella* sp.

Introduction

Enzymes are natural macromolecular catalysts and today the use of enzymes is unlimited. Highly efficient biocatalysts enzymes are explored for industrial-scale catalysis due to instead of 4-cholesten-3-one (CEO).[9] CHOx is strictly of bacterial origin and is not produced in plant or animal systems.[16] The most common and versatile CHOx producers are bacteria of gram-positive origin including *Arthrobacter*[5], *Bacillus* spp.[21], *Bordetella*[23], *Brevibacterium*[14], *Corynebacterium*[32], *Rhodococcus*[18] and *Streptomyces*.[11] The actinomycetes group is most common producer of CHOx. Few gram-negative bacteria including *Burkholderia*[7], *Chromobacterium*[9] and *Pseudomonas* sp.[15] are also reported for producing CHOx.

Screening and isolating new CHOx producing microorganisms are considered very important due to a range of applications that the enzyme holds and keeping it in focus, the enzyme has been isolated and purified from various microbial sources.[9] One of the well-established applications of CHOx is its use in the enzymatic assay carried out to detect and quantify the amount of cholesterol in food, serum and various other clinical samples.[27] The CHOx has also been stated to show promising results as an effective insecticidal and larvicidal agent.[30] CHOx can also play an important role as a biocatalyst for the production of a large range of valuable steroid intermediates such as 4-androstene-3, 17-dione (AD) and 1, 4-androstadiene-3,17-dione (ADD), which serve as starting materials in the synthesis of many anabolic drugs and steroid hormones.[15]

Cholest-4-en-3-one formed by catalysis of cholesterol by CHOx is an important synthetic intermediate in many steroid transformations and is found to be effective against obesity, liver disease and keratinization.[36] A previous study evaluated the functional effect of 4-cholesten-3-one in human cells and it was found that 4-cholesten-3-one generated after cholesterol oxidation restrained cell migration.[28]

Phytochemical characterization of Caraway *(Carum carvi)* seed extract and its use as a potent medicinal agent

Chauhan Vivek, Devi Sunita, Sharma Sonaxi and Kanwar Shamsher S.*
Department of Biotechnology, Himachal Pradesh University, Summer Hill, 171005, INDIA
*kanwarss2000@yahoo.com

Abstract
Carum carvi (Caraway) is a member of Apiaceae family which originated in Asia. Due to its economic importance, it is widely cultivated. Caraway is the only annual species, commonly present in arable land, moist meadows and on low lands to mountains. Caraway has different applications in pharmaceutical and food industries. Phytochemical screening of different medicinal plants is helpful in identifying new sources of industrially and therapeutically important compounds.

In this study, Caraway obtained from forest surrounding the village Goherman, Lahaul and Spiti, Himachal Pradesh (India) was used. Seed extract of caraway extracted in methanol (MSE) and distilled water (WSE) was used for phytochemical analysis to determine the constituents of caraway seeds. Further, caraway seeds extract was checked for antibacterial activity [Staphylococcus aureus (ATCC 6538), Salmonella typhimurium (NCTC 74), Escherichia coli (ATCC 25922) and Staphylococcus epidermidis (ATCC 12228)], antioxidant activity and acid neutralizing activity. After analysing the results, it can be said that caraway seeds possess many medicinal properties and it can be used in enhancing human health.

Keywords: Phytochemical characterization, TLC analysis, antimicrobial, antacid, antioxidant.

Introduction
Carum carvi (Caraway) a member of Apiaceae family which originated in Asia.[26] Caraway is the only annual species out of 25 species in Carum genus. It is commonly present in arable land, moist meadows and on low lands to mountains. Caraway has high economic value due to its applications in pharmaceutical and food industries. Caraway is extensively used in many food products on account of its pleasant flavour and preservative properties and also has a high medicinal value as its fruits can be used to cure pneumonia and indigestion and can be used as carminative, appetizer and galactagogue.[26,36] which in turn increase the appetite and results in digestive stimulation.[8]

About 5000 years ago, first evidence of caraway was found in Middle Eastern Asia.[27] Today, it is known to be cultivated in many countries like Russia, Holland, Poland, the Netherlands, Hungary, Denmark, Romania, Bulgaria, Morocco, Syria, the USA, Turkey and India. In India, the species is available in wild in the high-altitude regions of Jammu and Kashmir (Zanskar, Ladakh and Lungna), Himachal Pradesh (Lahaul and Spiti, Pangi-Bharmour and Kinnaur) and is cultivated in hills (as summer crop) and in plains (Northern India) as annual winter crop.[9]

Caraway seeds are rich source of dietary fibre and about 100 g of seeds can fulfil daily recommended intake (38%) of fibre. A pungent, anise-like aroma and flavour of caraway fruit is an attribute of essential oils mostly anethole, limonene and carvone. Due to abundance of essential oils caraway is frequently added to sauerkraut. Caraway fruits are used as remedy against pneumonia, indigestion and as appetizer and carminative in different traditional systems. The roots of this plant also serve as a food source and are cooked as vegetable like parsnips or carrots. In addition, leaves of caraway are consumed as herbs similar to parsley[44]. On account of this diverse spectrum of caraway applications, an attempt was made to study caraway seeds and test them for their medical benefits.

Material and Methods
Collection of sample: Collection of a sample (Caraway) was done from forest surrounding the village Goherman (32°.37.47. N; 76°.52.37. E), Lahaul and Spiti, Himachal Pradesh (India).

Moisture content estimation: The moisture content of Caraway seeds was determined according to the Standard method of AOAC (1999). The sample was weighed and placed in a hot-air oven maintained at 37± 1ºC for 4 days. The material was then cooled to room temperature using a desiccator and the weight loss in percentage was reported as moisture content of the seeds.

Preparation of Caraway Seeds extract(s): Dried plant seeds were washed under running tap water, air dried and

Process optimization for extracellular production of RNase by alginate-entrapped cells of *Bacillus* sp. RB-3

Vivek Chauhan[1], Priyanka Thakur[1], Rakesh Kumar[1], Vivek Kumar Dhiman[1] and Shamsher S. Kanwar[1]*
[1]Department of Biotechnology, Himachal Pradesh University, Summer Hill, Shimla-171 005, India.

Abstract
RNase, an endoribonuclease is a key enzyme that plays an indispensable role in gene expression and regulation in all organisms. Its active action either leads to the inevitable rapid destruction of transcripts or reveals their roles in RNase processing. In the present study, alginate-entrapped cells of a *Bacillus* strain were used for the production of an extracellular RNase by optimization of the fermentation process in a batch culture system. The alginate-entrapped bacterial cells after process optimization resulted in a 2.2-fold increase in RNase in the fermentation broth. The addition of glucose (1%; w/v), peptone (1.5%; w/v) and sodium nitrate (1.0%; w/v) in the production broth (pH 9.0) at 35°C for 24 h under continuous shaking (160 rpm) provided a yield 6.59± 0.028 U/ml of RNase by *Bacillus* sp. RB-3. During repetitive use of alginate-entrapped bacterial cells, the maximum RNase was recorded at 2ndcycle (6.71±0.035 U/ml) of fermentation under optimized process. Although, a further, reuse of alginate-entrapped bacterial cells exhibited a gradual decline in the RNase yield, yet ~47% of RNase could be achieved in the fermentation broth thereafter.
Keywords: RNase; alginate; immobilization; fermentation; batch system; process optimization.

1. Introduction

Bacterial RNase E, an endoribonuclease plays a key role in gene expression and regulation in organisms. Its active action either leads to the inevitable rapid destruction of transcripts or reveals their participation in RNase processing [1]. This enzyme also helps to control the quality of the synthesized rRNAs. RNase E activity can be controlled and modulated using signals provided *via* regulatory RNAs that guide the enzyme towards specific silencing transcripts [2]. Interestingly, an ancient human civilization could be traced with the use of enzyme-mediated processes. There is now significant research and development in the field of industrial enzymes that contributes to the development of both a variety of products and processes [3]. Also, enzymes are used to increase the efficiency of a variety of existing bioprocesses to improve yield of the product. Evidently, almost 4,000 enzymes are known, and 200 of them are commercially used [4]. Extracellular RNase circulates in the human blood plasma. Occasionally, it displays variations in concentration/patterns, during infection, trauma and in cancer [5]. There is a very large variety of RNA molecules in blood plasma. The circulating fragments of RNA molecules contain mitochondrial RNA, ribosomal RNA (rRNA), transfer RNA (t-RNA) and messenger RNA (m-RNA) fragments, and small non-coding RNA (snoRNA) fragments [6]. A new form of antiviral ribonuclease, secreted into the medium against TB mosaic virus, was observed in *Bacillus cereus* ZH14 strain [7]. Many ribonucleases could inhibit the replication of viruses in cells *in vitro* and laboratory animals, but their antiviral molecular mechanisms remained unclear. The cytotoxic activity of RNase against tumor cells made it valuable for therapeutic use, one such extracellular bacterial ribonucleases studied is RNase produced by *Bacillus pumilus* [8]. Besides, RNases can also lead to activation of tumor-derived macrophages either being triggered into the M1 phenotyl with well-established antitumor immune response control functions, or M2-macrophages, which can reduce tumor development, metastasis, and angiogenesis [9]. Several pieces of evidence were reported for RNases as conventional immune response components that form a perspective agent for the production of new antiviral therapy [10]. Microbial RNases have a strong cytotoxic nature and they degrade the cellular RNA within cell systems into oligonucleotides and mononucleotides. The cytotoxic effects of RNases involve the destruction of RNA molecules which triggers protein synthesis leading to blockage in malignant cells and inducing apoptosis [11]. Many RNases could prevent the replication and reproduction of viruses in infected cell cultures and laboratory animals, but their antiviral molecular mechanisms remain unknown [12].

Interestingly, it has been observed that entire cells and cell-components might be immobilized to function as multi-enzyme structures. The enzymes which are either available in tiny amounts or are costly are often chosen for immobilization on an appropriate matrix [13]. Cell immobilization has also been a favored method for enzymes that rely on the special arrangement of the membrane. The methods used for cell immobilization are almost the same as those used with acceptable adaptations for the immobilization of enzymes. Surface fitting and trapping are done using the gelling materials and membranes [14]. The physical isolation of cell or cellular organelles using the immobile system allows for a simple medium exchange for metabolic or nutritional regeneration purposes in these cell systems [15]. Cell immobilization is distinct from cell entrapment, since it imprisons, immobilizes as well as absorbs them into supportive materials [14]. Entrapment of enzymes/

Purification and identification of a surfactin biosurfactant and engine oil degradation by *Bacillus velezensis* KLP2016

Khem Raj Meena[1,5*], Rajni Dhiman[2,5], Kailash Singh[3], Sachin Kumar[4], Abhishek Sharma[5], Shamsher S. Kanwar[5], Rittick Mondal[6], Sandip Das[7], Octavio L. Franco[8,9*] and Amit Kumar Mandal[6,10*]

Abstract

Engine oil used in automobiles is a threat to soil and water due to the recalcitrant properties of its hydrocarbons. It pollutes surrounding environment which affects both flora and fauna. Microbes can degrade hydrocarbons containing engine oil and utilize it as a substrate for their growth. Our results demonstrated that cell-free broth of *Bacillus velezensis* KLP2016 (Gram + ve, endospore forming; Accession number KY214239) recorded an emulsification index (E_{24}%) from 52.3% to 65.7% against different organic solvents, such as benzene, pentane, cyclohexane, xylene, *n*-hexane, toluene and engine oil. The surface tension of the cell-free broth of *B. velezensis* grown in Luria–Bertani broth at 35 °C decreased from 55 to 40 mN m^{-1}at critical micelle concentration 17.2 µg/mL. The active biosurfactant molecule of cell-free broth of *Bacillus velezensis* KLP2016 was purified by Diethylaminoethyl-cellulose and size exclusion chromatography, followed by HPLC (RT = 1.130), UV–vis spectrophotometry (210 nm) and thin layer chromatography (R_f = 0.90). The molecular weight of purified biosurfactant was found to be ~ 1.0 kDa, based on Electron Spray Ionization-MS. A concentration of 1980 × 10^{-2} parts per million of CO_2 was trapped in a KOH solution after 15 days of incubation in Luria–Bertani broth containing 1% engine oil. Our results suggest that bacterium *Bacillus velezensis* KLP2016 may promise a new dimension to solving the engine oil pollution problem in near future.

Keywords: *Bacillus velezensis*, Biosurfactant, CO_2 estimation, Engine oil, Surfactin

Introduction

Environmental pollution is currently one of the most serious global issues. Engine oil used in automobiles is hazardous and toxic to the soil. Used engine oil that is spilled or wrongly discarded may enter storm water runoff and eventually enter into water bodies affecting adversely the environmental health of receiving water bodies [1]. Oil spills into the sea is an emerging issue, harming marine flora and fauna [2]. To protect the flora and fauna of the water bodies, treatment of engine oil (main polluting agent) is usually required.

Various treatment procedure involving both chemical and physical methods, like dissolving, precipitation or absorption, using a range and combination of processes to remove non-hydrocarbons, impurities and other constituents that may severely affect the performance properties of finished products or reduce the efficiency of the conversion processes. Methods comprise separation or removal of aromatics and naphthenes, including impurities and undesirable contaminants. Before processing Sweetening compounds and acids are used to desulphurize crude oil. Other treatment methods include chemical

Application of Lipase Purified from *Aspergillus fumigatus* in the Syntheses of Ethyl Acetate and Ethyl Lactate

Akshita Mehta, Chetna Grover, Kamal Kumar Bhardwaj, and Reena Gupta*

Department of Biotechnology, Himachal Pradesh University, Summer Hill Shimla (H.P.) 171 005, INDIA

Abstract: Microbial lipases are used for the synthesis of various short chain esters such as octyl acetate, methyl salicylate, ethyl acetate and ethyl lactate. In this study, a purified lipase of *Aspergillus fumigatus* was utilized for the synthesis of two esters i.e. ethyl acetate and ethyl lactate. The purified lipase from *Aspergillus fumigatus* performed esterification of ethanol and acetic acid (at a molar ratio of 1:1) when incubated at 40℃ under shaking (130 min^{-1}) for 12 h resulting in the formation of ethyl acetate (89%). In case of ethyl lactate maximum esterification (87.32%) was achieved when ethanol and lactic acid (500:100 mM) was used in heptane resulting in the synthesis of ethyl lactate at 40℃ under shaking (120 rpm) after 12 h of reaction time. These esters of short chain carboxylic acid and alcohols belong to the highly important natural aroma compounds and are used as green solvents in food and pharmaceutical industry.

Key words: ethyl acetate, ethyl lactate, *Aspergillus fumigatus*, esterification, lipase

1 Introduction

Lipases (triacylglycerol ester hydrolases E.C. 3.1.1.3) are ubiquitous enzymes that catalyse the breakdown of fats and oils with subsequent release of free fatty acid, diacylglycerol, monoacylglycerol and glycerol[1-4]. They are found in animals, plants, fungi and bacteria and are of considerable physiological significance and industrial potential[5]. However, the most suitable sources for lipase production are the microorganisms which can produce high quality lipases in lower cost and shorter time[6]. Fungi are more preferred sources of lipases because of their stability at different temperature and pH[7]. Purification of enzymes allows successful determination of their primary amino acid sequence and three-dimensional structure. Purified lipase preparations are needed in industries employing the enzymes for the biocatalytic production of food additives (flavour modifying enzymes), industrial reagents (glyceride hydrolyzing enzyme), stain removing agents (detergent additives), digestive drugs, diagnostic enzymes in medical applications, nutraceuticals, surfactants and additives in cosmetics[8-10].

Esters of short chain carboxylic acid and alcohols belong to the highly important natural aroma compounds. The production of natural aroma compounds by fermentation and enzymatic reactions in aqueous[11], organic solvent[12, 13] or novel environmentally friendly solvent media[14] has become a widely-studied field of research in the last few years. Ethyl acetate is used in the nail polish remover and in decaffeinating tea, coffee and cigarettes. It is also used in the perfumes because it evaporates quickly leaving the scent on the skin. It is found as a solvent in the cosmetic products. It is widely used as an extraction agent, intermediate in the pharmaceuticals. Ethyl acetate is an effective poison for use in entomology as its vapours are a respiratory tract irritant which can kill the insects quickly. It is also used as a carrier solvent for herbicides.

Ethyl lactate finds industrial applications in specialty coatings, inks, cleaners because of its high performance and versatility. Due to its low toxicity, ethyl lactate is a popular choice across many different scenarios. Ethyl lactate is a flavouring agent present in cabbage, peas, vinegar, bread, roasted chicken, butter, blackberry, pineapple, raspberry and various wines and spirits[15]. Ethyl lactate also known as lactic acid ethyl ester, is a monobasic ester formed from lactic acid and ethanol, commonly used as a solvent[16-18]. As a "green" solubilizing agent, ethyl lactate has many advantages compared with other organic-based solubilizing agents.

With the great recent interest for natural products, the flavour industry is more and more interested in the use of

Influence of Culture Conditions on the Production of Extracellular Esterase from *Bacillus licheniformis* and Its Characterization

Kamal Kumar Bhardwaj, Akshita Mehta, Lalit Thakur, and Reena Gupta*

Department of Biotechnology, Himachal Pradesh University, Summer Hill Shimla-171005, INDIA

Abstract: Esterases catalyze the hydrolysis of ester bonds in fatty acid esters with short-chain acyl groups. In the present study, thirty-seven bacterial isolates were isolated from soil contaminated with waste cooking oil, dairy waste etc. from Shimla and Solan district of H.P. Out of 37 isolates, the isolate RL-1, which gave maximum activity, was identified as *Bacillus licheniformis* MH061919. The optimization of various production parameters resulted in maximum activity at inoculum age of 24 h and inoculum size of 1.5% (v/v). Esterase gave considerable activity in production medium containing sodium chloride (0.5 % w/v), galactose (1%, w/v), coconut oil (2.0%, v/v) and beef extract (0.3%, w/v) at a temperature of 45℃ and pH 8.5. The enzyme production was enhanced by 3-fold after optimization of production parameters. Further, on optimizing reaction conditions, enzyme gave maximum activity at a temperature of 45℃ and pH 8.5. The para-nitrophenyl acetate (*p*-NPA) was found to be optimum substrate and metal ions and detergents have inhibitory effect on esterase activity.

Key words: esterase, coconut oil, *p*-NPA, *Bacillus licheniformis*, metal ions

1 Introduction

Microorganisms inhabit all possible locations from those offering ideal conditions for growth and reproduction to those representing extreme environments. Microbial lipolytic enzymes are more useful than those of other origins because of their high yields and ease of genetic manipulation[1]. Compared with chemical catalysis, enzyme-catalyzed reactions are generally more selective and run under environment friendly conditions with lower energy cost[2]. Microbial esterases are resistant to organic solvents, which makes them important catalysts in organic syntheses and especially for enantioselective or steroselective hydrolysis of esters[3]. Lipolytic enzymes including lipases and esterases are one of the most important groups of biocatalysts applied in many industries such as food, detergent, chemicals, cosmetic, biodiesel and pharmaceuticals[4].

Esterases (E.C. 3.1.1.1) belong to hydrolases class of enzymes which catalyze the cleavage and synthesis of ester bonds[5]. Esterases have broad substrate specificity, high chemo-, regio-, enantio-selectivity and non-aqueous catalytic properties[6]. Lipases and esterases can be distinguished on the basis of their substrate specificity, as esterasescatalyze the hydrolysis of carboxylic ester bonds of short chain fatty acids (<10 carbon atoms), with tributyrin as the standard substrate. However, true lipases have marked preference for long chain fatty acids (>10 carbon atoms) as substrates[6-10]. Esterases can catalyze esterification, interesterification and transesterification reactions in non-aqueous media without using cofactors[11-13]. They can also catalyse the ester synthesis and trans-esterification in water free or water-restricted medium[14, 15].

Esterases have a wide range of industrial applications. Microbial esterases perform some useful reactionslike the synthesis of short-chain esters, alcohol, lactones, and phenolic compounds, which contribute to the typical flavour of food[15, 16]. Esterases hydrolyse ester bonds and act on a wide variety of natural and xenobiotic compounds which makes them quite useful enzymes in bioremediation[17]. Marine esterases play an important role in marine organic carbon degradation and cycling[18].

There is a great urge to explore novel esterases from diverse microbial sources for potential industrial applications. However, the growing demand for esterases can be satisfied by developing the suitable production strategies. The present paper focused on isolation of esterase producing microorganism and optimization of enzyme production

Purification and Properties of an Esterase from *Bacillus licheniformis* and it's Application in Synthesis of Octyl Acetate

Kamal K. Bhardwaj[1], Adarsh Dogra[1], Smita Kapoor[1], Akshita Mehta[1] and Reena Gupta[1,*]

[1]*Department of Biotechnology, Himachal Pradesh University, Summer Hill, Shimla-171005, India*

Abstract:

Background:

Esterase plays a major role in the degradation of natural materials, industrial pollutants and also provides an immense contribution to the eco-friendly approaches in various industrial applications.

Objective:

In the present study, extracellular esterase from bacterial isolate *Bacillus licheniformis* was purified, characterized and used in the synthesis of octyl acetate.

Methods:

Purification of esterase from *Bacillus licheniformis* was achieved using Sephadex G-75 column chromatography. Gas chromatography was used to analyze the octyl acetate synthesis.

Results:

The enzyme was salted out using ammonium sulphate precipitation and 60-70% saturation gave maximum specific activity of the enzyme during precipitation. A purification fold of 6.46 and yield of 9.69% was achieved when esterase from *Bacillus licheniformis* was purified using Sephadex G-75 column chromatography. Native as well as SDS-PAGE analysis gave a single band of 42 kDa. This showed that the enzyme was purified to homogeneity and it was a monomer with molecular weight of 42 kDa. Biochemical characterization of the enzyme revealed that it had optimum temperature of 45°C in 0.1 M Tris-HCl buffer of pH 8.0. On optimizing different parameters, such as molar ratio of reactants, incubation time, temperature, and amount of protein, the % yield of octyl acetate was found to be 77.3%.

Conclusion:

In this work, simple method was used to purify esterase and the enzyme was further used in producing esters/products of commercial value within a reasonably short period of 12 h with a maximum yield of 77.3%.

Keywords: Esterase, *Bacillus licheniformis*, Octyl acetate, *p*-NPA, Sephadex G-75, Tris-HCl.

1. INTRODUCTION

Enzymes are biocatalysts that play an important role in metabolic and biochemical reactions [1, 2]. The demand for enzymes in the global market is projected to rise at a fast pace in recent years [3]. Micro-organisms are the primary source of enzymes because they are cultured in large quantities in a short span of time and genetic manipulations can be done on bacterial cells to enhance enzyme production [4]. In addition, the microbial enzymes have been paid more attention due to their active and stable nature as compared to enzymes from plants and animals [5]. Lipolytic enzymes, such as esterases, lipases and phospholipases, constitute a class of enzymes that catalyze the hydrolysis of a wide variety of substrates such as acylglycerols, fatty acid esters, or peptides [6 - 8].

Esterases (EC 3.1.1.1) represent a diverse group of hydrolases catalyzing the cleavage and formation of ester bonds. Esterases can catalyze esterification, interesterification, and transesterification, reactions in non-aqueous media without

Abstract

Esterases act on a wide variety of natural and xenobiotic compounds which makes them quite useful enzymes in bioremediation. In the present study, fifty-seven bacterial isolates were isolated from soil rich in oil or diesel (automobile workshop), contaminated with plastic wastes, sweet shop waste, garden soil, dairy soil and other soil samples in and around Hamirpur, Shimla and Solan districts of Himachal Pradesh, India. Out of these, the isolate EST-4, which gave maximum esterase activity, was identified as *Serratia* sp. (NCBI Accession No.: MH538970). Esterase gave considerable activity in PM5 medium containing g/l peptone (10.0, w/v), NaCl (5.0, w/v), beef extract (10.0, w/v), yeast extract (2.0, w/v) and cotton seed oil (1.0%, v/v). Further optimization of various production parameters resulted in maximum production at inoculum age of 18 h, inoculum size 1.0% (v/v), temperature 40 °C and pH 8.5. The presence of 1.0% (w/v) maltose, 4.0% (v/v) cotton seed oil and 2.0% (w/v) peptone in the medium enhanced esterase production when compared with other carbohydrate, lipid and nitrogen sources respectively. The enzyme production was enhanced by 2.12-fold after optimization of production parameters.

Keywords: Esterase; Cotton seed oil; *p*-NPA; *Serratia* sp.; Peptone; Maltose.

1. Introduction

Enzymes are the biocatalysts that play important role in metabolic and biochemical reactions.[1,2] They are ubiquitous in nature and are found in plants, animals and microorganisms.[3,4] The demand of enzymes in the global market is projected to rise at fast pace in recent years.[5] Lipolytic enzymes are highly diversified in their industrial applications. Esterases (E.C. 3.1.1.1, Carboxyl ester hydrolases) belong to hydrolase class of enzymes which catalyze the cleavage and synthesis of ester bonds.[6] They bring about the hydrolysis and synthesis of acyl glycerides and other fatty acids esters.[7,8] Esterases are enzymes that catalyze the hydrolysis of various types of both endogenous and exogenous esters.[9]

Microbial esterases are resistant to organic solvents, which makes them important catalysts in organic syntheses and especially for enantioselective and/or stereoselective hydrolysis of esters.[10] Microbial esterases are of considerable interest because their cost of production is low and they are also convenient to manipulate.[11] Esterase producing bacteria have been found in diverse habitats such as soil contaminated with oil, dairy waste, industrial wastes, oil seed and decaying food, compost heaps, coal tips and hot spring.[12,13] Esterases can catalyze esterification, interesterification and transesterification reactions in non aqueous media without using cofactors.[14,15] Particularly they catalyze the hydrolysis of esters composed of short-chain fatty acids.[16]

Carboxyl esterases can also be distinguished from lipases by their substrate spectra, using *p*-nitrophenyl palmitate (cleaved by lipases) vs. *p*-nitrophenyl butyrate (cleaved by esterases and sometimes by lipases).[4,17] The industrial applications of esterases provide an immense contribution to the eco-friendly approaches towards nature and also in food, textile industries, as additives in detergents, agrochemical (herbicides, insecticides) industries and bioremediation.[18,19] Esterases also play a major role in the degradation of natural materials and industrial pollutants, viz., cereal wastes, plastics and other toxic chemicals. They are useful in the synthesis of optically pure compounds, antioxidants, flavoring agents and perfumes.[20,21] A highly active cross-linked enzyme aggregates from a novel thermostable esterase estUT1 of the bacteria *Ureibacillus thermosphaericus* have been used for the removal of malathion from waste water.[22] Polyurethane esterase from *Comamonas acidovorans* degrades low molecular weight polylactic acid made up of poly diethylene adipate by cleaving the ester bond between polymers.[17] Due to numerous biotechnological applications, researchers have made attempts to isolate esterase producing micro-organisms.[23]

The present work is focused on screening of esterase-producing microorganisms and isolation of *Serratia* sp. The optimization of various production conditions such as carbohydrates, lipid and nitrogen sources was studied, with focus on the role of carbohydrates on the esterase activity. This is one of the few reports on the production of extracellular esterase from *Serratia* sp.

2. Materials and Methods

2.1 Chemicals

The chemicals used were tributyrin, *p*-nitrophenyl acetate (*p*-NPA), *p*-nitrophenol (*p*-NP), isopropanol, Tris buffer, maltose, galactose, glucose, lactose, beef extract and peptone. All the chemicals used were of analytical grade and high purity either procured from Sigma Aldrich (U.S.A) or HIMEDIA (Mumbai, India).

2.2 Methods

2.2.1 Sample collection

Samples were collected from various locations such as soil rich in oil or diesel (automobile workshop), contaminated with plastic wastes, sweet shop waste, garden soil, dairy soil and other soil samples in and

Polyhydroxyalkanoate and its efficient production: an eco-friendly approach towards development

Rutika Sehgal[1] · Reena Gupta[1]

Received: 13 August 2020 / Accepted: 9 November 2020 / Published online: 24 November 2020
© King Abdulaziz City for Science and Technology 2020

Abstract
Polyhydroxyalkanoate (PHA) is the most promising solution to major ecological problem of plastic accumulation. The biodegradable and biocompatible properties of PHA make it highly demanding in the biomedical and agricultural field. The limited market share of PHA industries despite having tremendous demand as concerned with environment has led to knock the doors of scientific research for finding ways for the economic production of PHA. Therefore, new methods of its production have been applied such as using a wide variety of feedstock like organic wastes and modifying PHA synthesizing enzyme at molecular level. Modifying metabolic pathways for PHA production using new emerging techniques like CRISPR/Cas9 technology has simplified the process spending less amount of time. Using green solvents under pressurized conditions, ionic liquids, supercritical solvents, hypotonic cell disintegration for release of PHA granules, switchable anionic surfactants and even digestion of non-PHA biomass by animals are some novel strategies for PHA recovery which play an important role in sustainable production of PHA. Hence, this review provides a view of recent applications, significance of PHA and new methods used for its production which are missing in the available literature.

Keywords Applications · Biodegradable plastic · Biosynthesis of PHA · Economic production · Molecular approach

Introduction

The consistent accumulation of conventional synthetic plastic in environment has compelled us to think that there is an urgent need to replace it with biodegradable plastics. Polyhydroxyalkanoate (PHA) is the most promising solution to this major ecological problem. The properties of PHA make it close to plastics hence PHA bioplastic makes a good alternate which is biodegradable and biocompatible. Chemically, PHAs are in vivo polymerized polyoxoesters of hydroxyalkanoates (Sowinski et al. 2010) which are produced by microorganisms when there is carbon rich and nutrient (nitrogen, phosphorous, magnesium or sulfur) limiting condition for their energy and carbon storage (Koller 2018a, b). PHAs are produced in the form of water insoluble granules within the cytoplasm of the cell. PHA help microorganisms to survive under environmental stress conditions, and it is the key mechanism for their survival (Saharan et al. 2014). During starvation, the presence of PHA protects the cellular components such as RNA and proteins (Vinet and Zhedanov 2010) and it also plays an important role in sporulation. It has potential protective mechanisms for bacterial cells when they are exposed to freezing and thawing (Obruca et al. 2016), osmotic shocks, oxidative pressure, desiccation, H_2O_2 supply, heavy metals and UV exposures (Obruca et al. 2020).

PHA was first discovered by Lemoigne in 1925 from *Bacillus megaterium* (Chee et al. 2010) in poly(3-hydroxybutyrate) (PHB) form. Other forms of PHA were discovered afterwards. In 1974, Wallen and Rohwedder (1974) extracted 3-hydroxyvalerate along with 3-Hydroxybutyrates and some higher molecular weight components from activated sewage sludge. Short chain length hydroxyacids of 11 different types were reported by Findlay and White (1983) from marine sediment extracts, also 3-Hydroxyheptanoate (3HHp) was detected in *B. megaterium* in same year. Since then the number of PHA being discovered is increasing, and nearly 150

Abstract

Garlic (Allium sativum) is recognized for its potential to treat and prevent various diseases including cardiovascular problems, common cold, bacterial and fungal infections. Garlic is bestowed with an array of organosulphur compounds rich in phytochemicals which act as antioxidant agents. Present study was undertaken for qualitative as well as quantitative analysis of phytochemical constituents of Allium sativum.

The 2,2-diphenyl-1-picrylhydrazyl (DPPH) radical scavenging activity of methanol and chloroform extracts of garlic was found to be better than other extracts used in the study. These extracts showed good antibacterial activity against selected pathogenic bacterial cultures including Pseudomonas, Bacillus, Shigella and Salmonella. Sliver nanoparticles were also synthesized with the aid of garlic extract and were characterized by X-Ray diffraction. Synthesized silver nanoparticles showed good antibacterial activity against all Salmonella followed by Bacillus, Shigella and Pseudomonas.

Keywords: *Allium sativum*, Phytochemicals, Antioxidant, Antimicrobial, Silver nanoparticles.

Introduction

Allium is a genus of perennial bulbulous plants that produces chemical compounds which are a characteristic of onion or garlic flavour and aroma.[1] *Allium sativum* commonly known as garlic, is a member of Alliaceae family.[2] When crushed, *Allium sativum* yields allicin and phytonicide which serve as antimicrobial compounds.[3] It also contains other compounds including allinin, ajoene, diallylsulfide, B-vitamins, proteins and many phytochemicals.[4] Phytochemicals are the bioactive compounds found in plants that work with nutrients and dietary fibres to protect human against diseases.[5]

Many phytochemicals have antioxidant activity and reduce the risk of many diseases. The biological synthesis of silver nanoparticles emerges as an eco-friendly and exciting approach in the field of nanotechnology.[6] Silver nanoparticles (AgNPs) have been known to have inhibitory and bactericidal effects.[7,8] Use of biological organisms, plant extracts or plant biomass for the synthesis of silver nanoparticles serves as an alternative to the chemical and physical methods which are expensive and hazardous to the environment.[15] The present study demonstrated *in-vitro* evaluation of antimicrobial properties of different solvent extracts of garlic and the synthesized silver nanoparticles.

Material and Methods

Plant material and preparation of extract: *Allium sativum* (garlic) cloves were collected from local market of Shimla, Himachal Pradesh. Bulbs of *Allium sativum* were first washed with tap water followed by distilled water and ground to fine paste using mortar and pestle. 50 g each was soaked in 100 ml of different solvents i.e. distilled water, methanol, chloroform and dimethyl sulfoxide for 24 hours.[9] The extracts were then transferred to four different plates and kept at 40-60℃ to evaporate the solvents. Powdered form was obtained after 24-72 hours.[10]

Phytochemical analysis: The qualitative phytochemical analysis was carried out to detect the presence of different phytoconstituents including carbohydrates, tannins, flavonoids, amino acids, saponins and cardiac glycosides according to the standard method described by Arora and Kaur[11] and Gayathri and Kiruba[8]. General reactions revealed the presence or absence of these compounds.

Quantitative analysis of different solvent extracts of *Allium sativum*: To determine the amount of a substance per unit volume or unit weight, quantitative assay was performed. Crude samples prepared in different solvents were used for the determination of amino acid concentration.

Thin Layer Chromatography: The thin layer chromatography (TLC) was used to determine the retention factor (R_f) value of separated compounds. Aliquots of the extract and standard were applied on the TLC plate. The plate was placed in a glass beaker containing n-butanol:acetic acid:distilled water in ratio of 2:2:6 as a mobile phase.[12]

Anti-oxidant assay: DPPH free radical scavenging activity assay was performed by slightly modified method of Veluman.[13]

Assessment of Antibacterial Activity: Antibacterial activity of different solvent extracts was tested against *Pseudomonas*, *Shigella*, *Salmonella* and *Bacillus* by using well diffusion method according to Clinical and Laboratory Standards Institute (CLSI) protocol.

Minimum Inhibitory Concentration (MIC) against selected pathogenic cultures: MIC was performed by using the method of Teh et al.[14]

Abstract

In this study, malathion and chlorpyrifos degrading bacteria were isolated from agricultural soil samples taken from the Himachal region in India. A total of 52 organisms were isolated which were further screened for their efficiency for chlorpyrifos and malathion degradation. Screening was done by checking the growth on Nutrient Agar, Mineral Salt Medium and MacConkey agar plates containing chlorpyrifos and malathion; 37 isolates showed growth in these. Biomass assay and minimum inhibitory concentration (MIC) determination were carried out for the selection of most efficient bacterial isolates. Out of the seven isolates which showed good biomass assay and MIC, only three isolates (PDM-2, PDM-15 and PDM-20) were selected for further studies. These were characterized by various biochemical tests, Gram staining, indole test, methyl red test, Voges-Proskauer test, citrate utilization test and carbohydrate fermentation test. Out of three isolates, PDM-15 showed good resistance against the antibiotics such as erythromycin, chloramphenicol, ampicillin and penicillin and identified as *Kocuria assamensis*. Degradation of 71.3% of chlorpyrifos and 85% of malathion was observed by the gas chromatography. Therefore, the *Kocuria assamensis* can be used in the bioremediation of pesticide-contaminated soil.

Abstract
In the present study, an extracellular esterase from *Serratia* sp. was purified 24.46 fold using an initial ammonium sulphate precipitation step (optimized concentration of 30–40%), followed by Diethylaminoethyl cellulose (DEAE-cellulose) chromatography and size exclusion Sephadex G-200 column chromatography steps. The molecular weight of the esterase using native polyacrylamide gel electrophoresis (PAGE) was determined to be 236 kDa and by using sodium dodecyl sulphate polyacrylamide gel electrophoresis (SDS-PAGE) was found to be 60 kDa suggesting that the enzyme was a tetramer of 4 subunits. The purified esterase was able to catalyze the hydrolysis of *p*-nitrophenyl esters, especially *p*-nitrophenyl acetate. Maximum esterase activity was achieved in 0.15 M Tris–HCl buffer of pH 8.5 at 50 °C after 10 min. The enzyme was stable for at least 8 h at 4 and 35 °C but the half-life was determined to be 4.5 h at 50 °C and 3 h at 60 °C. The esterase activity was inhibited by detergents (1 mM) (Triton X-100, Tween 60, Tween 80, ethylenediamine tetraacetic acid and SDS) except Tween 20. The esterase activity was inhibited by organic solvents (1 mM) such as ethanol, methanol, acetone, acetonitrile and was stable in the presence of glycerol, isopropanol but the organic solvent dimethyl sulfoxide (DMSO) significantly ($p < 0.05$) enhanced esterase activity. The matrix-assisted laser desorption ionization-time of flight mass spectrometry showed that the enzyme exhibited similarity with the pimeloyl-[acyl carrier protein] methyl ester esterase of *Serratia marcescens*.

Keywords Diethylaminoethyl cellulose · Tris–HCl buffer · *p*-NPA · SDS-PAGE · Esterase · Matrix-assisted laser desorption ionization-time of flight mass spectrometry

Introduction

Esterases play a dominant role in lipid metabolism in plants, animals, and microbes (Castro et al. 2018). A large number of microbes are known to produce esterases and include *Micropolyspora faeni, Bacillus pumilis, E. coli, B. subtilis, Pseudomonas fluorescens, Halobacillus* sp. strain LY5, *Bacillus subtilis* NRRL, *Vibrio fischeri, Streptomyces lividans* 66, *Bacillus licheniformis.* Esterases are of considerable interest as they have large numbers of industrial applications, can be produced relatively quickly due to the fast microbial growth rates and can be cheaply produced due to the ease of culturing microbes on cheap medium (Kulkarni et al. 2013; Liu et al. 2020).

reenagupta_2001@yahoo.com

[1] Department of Biotechnology, Himachal Pradesh University, Summer Hill, Shimla 171005, India

Under natural conditions, esterases catalyze the hydrolysis of ester bonds at the interface between an insoluble substrate phase and the aqueous phase in which the enzyme is dissolved. Under certain experimental conditions, such as in the absence of water, they are capable of reversing the reaction. These enzymes have good chemo-, regio-, and/or enatio-selectivity (Gupta et al. 2012). Esterase plays a major role in the degradation of natural materials and industrial pollutants, viz., cereal wastes, plastics, and other xenobiotic compounds (Bhardwaj et al. 2020; Wei et al. 2020). The enzyme has the potential for the synthesis of flavor esters (Bhardwaj et al. 2017; Zwane et al. 2017; Maester et al. 2020), optically pure compounds, antioxidants and perfumes (Panda and Gowrishankar 2005).

Esterases have diverse applications in biotechnology as additives in laundry detergents and as stereo-specific biocatalysts in pharmaceutical production (Panda and Gowrishankar 2005). Esterases differ in their substrate specificity and can be used in various medical applications (Kumari et al. 2021). However, most industrial processes often

Insights into bioactive compounds and *in vitro* antioxidant, antibacterial and cytotoxic potential of *Solanum lycopersicum*

Abstract
Solanum lycopersicum (tomato) is a widely cultivated vegetable crop worldwide and its consumption is increasing day by day. The only edible part of tomato plant is its fruit. Therefore, the residual tomato plant parts are considered as waste after fruit collection. Present study aimed to detect the phytochemical, antioxidant, antibacterial and cytotoxic activities of *Solanum lycopersicum*. Phytochemical analysis of *Solanum lycopersicum* peel and pulp revealed the presence of tannins, flavonoids, amino acids and reducing sugars. DPPH (2,2-diphenyl-1-picrylhydrazyl) radical assay showed that methanol and DMSO extracts of *Solanum lycopersicum* peel and pulp were strong antioxidants. Methanol extract of *Solanum lycopersicum* peel was active against *S. flexnari, B. cereus* and *P. aeruginosa* with MIC values of 0.03 mg/100µl, 0.03 mg/100µl and 0.01 mg/100µl, respectively. *B. cereus* was also inhibited by distilled water extract of *Solanum lycopersicum* peel having MIC value of 0.03 mg/100µl. Chloroform extract of *Solanum lycopersicum* pulp was most active against *S. typhi* with MIC value of 0.03 mg/100µl. The effect of cytotoxicity of *Solanum lycopersicum* peel and pulp on RD cell line was evaluated through micro-culture tetrazolium assay (MTT) and the results showed a reduction in cell viability of RD cell line. Methanol extract of *Solanum lycopersicum* peel reduced the cell viability of RD cell line at 10 mg/µl, 20 mg/µl concentrations to 49.1%, 19.8%, respectively and the pulp extract reduced the cell growth to 44.8%, 15.7% at 10 mg/µl and 20 mg/µl concentrations, respectively.

Keywords: *Solanum lycopersicum,* bioactive, antioxidant, cytotoxic, antimicrobial

1.Introduction

Solanum lycopersicum (tomato) is a versatile fruit that is consumed fresh as well as in the form of processed products. Substantial quantities of tomatoes are processed into juices and purees, which generate wastes. The remaining plant materials are typically used as an unbalanced food for feeding livestock (mainly cattle), without any apparent economic benefit for the tomato producers. Consumption of tomatoes, tomato products and isolated bioactive tomato ingredients is reported to be associated with lowered risk of hypertension, heart disease, diabetes, cardiovascular disease and cancer [1]. *Solanum lycopersicum* belongs to the plant family solanaceae and genus *solanum* and it is spread throughout the world. It is used as juice, soup, puree, ketchup or paste and is known to be beneficial for the heart. It contains the carotene lycopene, one of the most powerful natural antioxidants. Lycopene has also been shown to improve the skin's ability to protect against harmful UV rays [2]. In addition to its flavor properties, *Solanum lycopersicum* is reported to possess numerous beneficial nutritional and bioactive components that may also benefit human health. These include the nutrients vitamin A, vitamin C, iron, and potassium. *Solanum lycopersicum* is also an excellent source of free radical-scavenging, bone healthy vitamin K, vitamin B6 and folate.

In addition, *Solanum lycopersicum* is a good source of heart-healthy magnesium, niacin, vitamin E, vitamin B1 and phosphorus [3,4]. Consumption of tomatoes, tomato products and isolated bioactive tomato ingredients is reported to be associated with lowered risk of hypertension, heart disease, diabetes, cardiovascular disease and cancer. Cancer is a major health problem, with significant associated death and disability and it is second leading cause of death in developed countries [2]. Globally, cancer is a major public health burden, accounting for one in eight deaths overall more than AIDS, tuberculosis and malaria combined. The world health organization (WHO) reports that 1.1 million people die of lung cancer each year. Epidemiological studies have suggested that lycopene decreases the risk of several types of human malignancies, such as breast and lung cancer [4]. These considerations suggest that edible tomato contains antibacterial, antioxidant, anticancer and phytochemical properties which may have multiple benefits [3].

2. Materials and Methods

2.1 Plant material and preparation of extract

The plant material used in present study was collected from local market of Shimla, Himachal Pradesh. Tomatoes were first washed with tap water followed by distilled water and then peeled. Peeled tomatoes and pulp were ground to fine paste using mixer grinder. 50 g each was soaked in 100 ml of different solvents *i.e.* methanol, chloroform, dimethyl sulfoxide (DMSO) and distilled water for 24-48 hrs. The extracts were then filtered using Whatmann No. 1 filter paper. The resulting extracts were collected in falcon tubes for further use.

Review Paper:

Insights into pathophysiology, immune response and treatment of novel CoVID-19

Abstract

The beginning of year 2020 has brought with it mass destruction of mankind in form of novel coronavirus, named as CoVID-19. Declared as pandemic by World Health Organization (WHO), CoVID-19 has its origin in bats and pangolin from which it was probably transferred to human. Subsequent human to human transmission has been seen by respiratory droplets, fomites and oral-fecal route. The disease has caused widespread deaths in America, China, France and Italy followed by many European and Asian countries. CoVID-19 targets the human lungs and multiplies in alveoli using host machinery. Interstitial edema and alveolar edema at later stages cause alveoli collapse and difficulty in breathing. Severe cases may pave to systemic inflammatory response that has fatal response in body.

Unfortunately, researchers are still struggling for potential vaccine or promising drug to combat the disease. WHO has issued guidelines suggesting regular hand washing, social distancing, wearing masks and quarantination as the best ways to prevent infection. This review gives an overview of the novel CoVID-19, conditions and immune response of human body related with it.

Keywords: CoVID-19, coronavirus, pathophysiological, immune response, treatment.

Introduction

The early December 2019 marked the beginning of the widespread outbreak of coronavirus (CoVID-19) or the Severe Acute Respiratory Syndrome Virus-2 (SARS-CoV-2) in Wuhan city of Hubei province of China[69].The Huanan seafood wholesale market was suspected to be associated with this outbreak of coronavirus and hence this market was ceased by Wuhan public health authorities. The researchers of China isolated the SARS-CoV-2 from infected patients and characterized it by using next generation sequencing and real time reverse transcription polymerase chain reaction[83].

It has spread expeditiously infecting a wide range of people globally. On 31st January 2020, World Health Organization declared it as Public Health Emergency of International Concern (PHEIC) following widespread infections. On 11th of March 2020, it was declared as a pandemic[80].

Novel SARS-CoV-2 belongs to the family coronaviridae, subfamily coronavirinae and genus betacoronavirus[17]. Table 1 shows a list of coronaviruses that infect humans.

Until the spread of Severe Acute Respiratory Syndrome in 2002, coronaviruses were known to cause mild respiratory and gastrointestinal infections only[11, 50]. But over last two decades, mankind has faced severe high fatality rates caused by (SARS)-CoV, Middle East Respiratory Syndrome (MERS)-CoV and SARS-CoV-2 betacoronaviruses showing their potential to dwell in interspecies host and causing widespread infections[5,79]. Coronaviruses are spherical in shape and derive their name from their crown like appearances due to the presence of structural spike proteins (S). Diameter of a typical SARS-CoV-2 varies between 60 nm to 140 nm[41].

The genetic material consisting of 30 kb single stranded positive sense RNA (3'-poly-A tail and 5'-cap) is enveloped inside structural proteins namely envelop proteins, membrane (M) and spike proteins[6]. The virus uses the spike proteins to bind to the type II pneumocyte cells in the upper respiratory tract by specific receptors called as angiotensin converting enzyme-2 (ACE-2)[81].

Table 1
List of coronaviruses that infect humans

Genus	Varieties causing disease in humans
Alphacoronaviruses	• Human coronavirus 229E (HCov-229E)
Betacoronaviruses	• Human coronavirus NL63 (HCoV-NL63, New Haven coronavirus) • Human coronavirus OC43 (HCov-OC43) • Middle East Respiratory Syndrome-related coronavirus (MERS-CoV or HCoV-OC43) • Severe Acute Respiratory Syndrome coronavirus (SARS-CoV-1, which causes SARS) • Severe Acute Respiratory Syndrome Coronavirus 2 (SARS-CoV-2, which causes CoVID-19)

Central composite design

ABSTRACT

Objective: The aim of present study was to determine the effect of interaction among different production variables on esterase production from *Serratia* sp. EST-4.
Method: The optimum and combined effect of independent parameters were determined using Plackett-Burman and Central Composite Design (CCD) (Design Expert 11).
Results: The effect of six parameters-cotton seed oil, peptone and maltose concentrations, pH, temperature and inoculum volume for production of esterase was determined by Plackett-Burman design. Four factors *i.e.* inoculum size, pH, peptone concentration and cotton seed oil concentration had significant effect on yield of esterase as suggested by the Pareto chart. Under optimized conditions, (inoculum size (1.0%, v/v), pH (8.0), peptone concentration (1.5%, w/v) and cotton seed oil concentration (4.0%, v/v)), the maximum esterase production was 9.77 U/ml. Analysis of variance (ANOVA) of the Central Composite Design (CCD)-based experiment exhibited the model F-value of 44.24 and P-value of <0.0001 which implies that model was significant and adequate to represent the system.
Conclusion: Inoculum size 1.0%, v/v, pH 8.0, concentration of peptone 1.5%, w/v and concentration of cotton seed oil 4.0%, v/v had positive effect on esterase production and provided 1.52-fold increase in esterase production than that obtained by optimizing one factor at one time.

1. Introduction

Microorganisms are main source of enzymes, because they can be manipulated genetically to increase the production of enzyme and are cultured on large scale in short time (Anbu et al., 2017; Sarkar et al., 2020). Phospholipases, lipases and esterases are lipolytic enzymes and belong to hydrolase class of enzymes that hydrolyze various substrates such as triacylglycerides, esters or peptides (Miranda et al., 2015,; Bhardwaj et al., 2017; Wang et al., 2018). Esterases are important group of hydrolases which catalyze different reactions such as esterification, interesterification and *trans*-esterification in water free or water-restricted mediumwithout using metal ions (Godinhoet al.,2011; Duarte et al., 2016). Esterases are widely used in the remediation of pyrethroid, ester-containing carbamate and organophosphate pesticides and are environment-friendly choice for the removal of recalcitrant compounds (Bhatt et al., 2020a; Bhatt et al., 2021). In general, all esterases contain the consensus sequence Glycine-X1-Serine-X2-Glycine as the catalytic moiety. (López-López et al., 2014; Ding et al., 2018; Bhardwaj et al., 2020).

The production of new esterases from different microbial sources is great compulsion for various biotechnological applications which requires cost effective production and stability of biocatalyst under extreme conditions (Maesteret al., 2020; Adiguzel, 2020). However, suitable production strategies must be developed to meet the growing demand of esterases. The optimization of enzyme production by varying one factor at a time does not consider the combined effect of all parameters, is laborious and cannot gave assurance of the optimum level of each parameter conditions (Lotfy et al., 2007; Hye et al., 2008; Kammoun et al., 2008; Gadhe et al., 2011; Tijani et al., 2011). On the other hand, Response Surface Methodology (RSM) can provide reliable optimization results as it helps in studying the effect of several variables at a time at different degrees to evaluate the combined effect of more than one parameters (Benzina et al., 2012; Yasmeen et al., 2013).

Abstract

Esterase belongs to hydrolase class of enzyme which catalyses the breakdown and creation of the ester bond. Due to its properties like regio-selectivity, stereo-specificity and stability in organic solvents, esterase is widely used in industrial processes. Esterases have applications in food industry, paper industry, notably in degradation of plastics and pesticides and for the synthesis of optically pure compounds. One of the toughest tasks is upholding the structural stability of enzyme for the duration of any biochemical reaction. Immobilization provides solution for this problem. Immobilization is the restraining of enzyme to a support. With the recent advances in technology, the use of new approach like nanoparticles, magnetic nanoparticles and cross-linked enzyme aggregates (CLEAs) is preferred by researchers. Nanoparticles provide better stability, multi-functionality and higher surface area for immobilization. Current review comprises of various methods used in immobilization of esterase and applications of esterase.

CLONING AND SEQUENCING OF POTATO *trnI* AND *trnA* PLASTID DNA FRAGMENTS FOR DEVELOPING HOMOLOGOUS PLASTID TRANSFORMATION VECTOR

Neelam Kaushik*[1], Arvind Kumar Bhatt [2], Swarup Kumar Chakrabarti[1]

[1]*Division of Crop Improvement, Central Potato Research Institute, Shimla, India*

[2]*Department of Biotechnology, HPU, Summer Hill, Shimla, India*

ABSTRACT

For developing plastid transformation vector, based on homologous targeting regions of potato (*Solanum tuberosum* L.), the *trnI* and *trnA* intergenic regions of the plastome from the commercial potato cultivar Kufri Bahar was PCR amplified, cloned and sequenced. Isolation and cloning of potato *trnI* and *trnA* cpDNA fragments into pDrive cloning vector yielded plasmid pD*trnI* and pD*trnA* with cpDNA fragments of approximately 800 bp and 1000bp, respectively. Sequence alignment using Clustal W revealed 98% sequence homology with the corresponding fragment of *Nicotiana tabacum* L. (GenBank Accession no. Z00044). The most remarkable difference was 9 bp insertion from 647-655 in potato plastome that was missing in tobacco. Similarly, sequence alignment of potato *trnA* region showed 100% identity to the respective fragment of *Nicotiana tabacum* L., except an insertion of 102 nucleotides from 700-801. The observed differences in the sequence homology between potato and tobacco plastome might be responsible for lower transformation efficiency in potato using tobacco-based vector. The presence of unique restriction enzyme sites within the intergenic region of both fragments will make possible the construction of potato specific plastid transformation vector. The cloned *trnI*/*trnA* region of the potato plastome will contribute towards designing plastid transformation vector with better transformation efficiency.

Keywords: Chloroplast DNA, Plastid transformation, Plastome, Potato, Tobacco.

1. INTRODUCTION

The plastid genome is an attractive target for genetic engineering in higher plants which offers several unique advantages over nuclear transformation including maternal inheritance of transgene, no position effect as the genes of interest are introduced into the plastome via homologous recombination and high level of foreign protein expression [1-3]. Plastid transformation in higher plant was first successfully reported in tobacco using mutant plastid 16S ribosomal RNA gene for selection of transformants [4]. Plastid transformation has been reported in many other higher plants such as *Arabidopsis thaliana* L. [5], potato [6-9], rapeseed [10], rice [11,12], tomato [13-14], soybean [15], carrot [16], cotton [17], wheat [18], eggplant [19,20] and many more. Recently plastid transformation has been reported in bitter melon [21], medicinal plant (*Artemisia annua* L.) [22] and licorice weed (*Scoparia dulcisi* L.) [23]. However, plastid transformation is routinely reported in tobacco and the efficiency of transformation is much lower in other plants than in tobacco [24]. Due to this success and specially because *Arabidopsis*, potato and tomato were transformed with homeologous vectors (not species-specific vectors), the plastid genomes of important crop species have received increasing attention with the possibility to develop chloroplast transformation systems to introduce agronomically important traits for plant improvement into the chloroplast genome [25] .

The chloroplast genome generally has a highly conserved organization among different plant species, having two identical copies of a 20 to 30 kb inverted repeat region (IRA and IRB) separating a large single copy (LSC) region and a small single copy (SSC) region [26]. Stability of plastid transformation depends on the integration of foreign gene into the plastid genome by homologous recombination of flanking sequences used in plastid transformation vectors. Hence the introduced gene must be flanked by sequences homologous to the plastid genome.

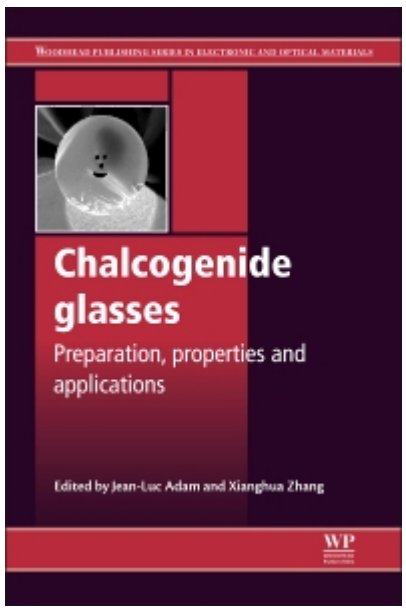
Abstract
Xylan, second most abundant natural polysaccharide after cellulose, has tremendous applications in various industrial processes. There are several xylan degrading catalysts available, but, still, there is continuous quest among the scientific community to search for new hyperactive xylanases. In the present study, the catalytic potential of xylanase from *Bacillus* sp. XPB-11 was improved using various mutagens. 5-Bromo-Uracil proved to be the best mutagen resulting in stable and hyperactive mutant BU-7 that showed maximum xylanase activity, i.e., 154.16 ± 2.23 U/mg protein. Further, optimizing the various parameters resulted in 20% enhancement and overall twofold increase in the xylanase activity of mutant, i.e.188.24 ± 1.80 U/mg protein. This hyperactive mutant released 26.8 ± 2.17 mg/ml of C-5 sugar from microwave + 0.5 N NaOH pretreated pine needle waste biomass that on fermentation using *Kluyveromyces marxianus* MTCC 1498 produced 5.34 g/l of bioethanol with 3.89% yield and 93.5% purity. The hyperactive xylanase from *Bacillus* sp. XPB-11 mutant BU-7, developed in the present study to release C-5 sugar from pine needle waste biomass and its subsequent biotransformation into bioethanol, is of commercial significance to utilize one of the problematic waste biomass from Himalayan Region for its conversion into second-generation biofuel i.e. bioethanol.

Keywords Xylanase · Mutagenesis · Pine needle hydrolysate · *Kluyveromyces marxianus* · Fermentation · Bioethanol

1 Introduction



Lignocellulose is one of the most abundant biomass available in nature. It mainly consists of cellulose (33–51%), hemicellulose (19–34%), and lignin (20–30%) [1]. Hemicellulose particularly contains xylan which has tremendous industrial applications and can be converted to various useful products including biofuel, nutraceuticals, and other value-added products once converted to xylose by xylanolytic [2]. Several cellulase-free xylanases are well characterized and reported which differ in chemical structures and functions based upon the organisms from which these are derived [3–5]. To meet the demands of various industries, R & D efforts have been focused on the studies related to enzyme stability under different processing conditions, such as pH, temperature, inhibitory ions, and the yield of the enzyme, in addition to its ability to hydrolyze the substrate and improving the enzyme activity [6, 7]. Although number of xylanolytic enzymes from various wild type strains have been studied with typcial characteristics but still many of them lack the desired features to meet the demand of industries. Moreover, industrial applications need prolonged stability, high efficiency and productivity on a sustainable basis at a low cost. This requires isolation, screening of hyper enzyme-producing strains, their improvement along with development of efficient industrial processes for various biotechnological applications [8]. Genetic manipulations through mutagenesis, genetic engineering, and recombinant DNA technology play an important role in the large-scale production of xylanases with desired features, but enzyme yield has been a problem most of the time [9, 10]. These hyperactive xylanases could also play an important role in releasing C-5 sugar from lignocellulosic biomass which can

Description

The unique properties and functionalities of chalcogenide glasses make them promising materials for photonic applications. Chalcogenide glasses are transparent from the visible to the near infrared region and can be moulded into lenses or drawn into fibres. They have useful commercial applications as components for lenses for infrared cameras, and chalcogenide glass fibres and optical components are used in waveguides for use with lasers, for optical switching, chemical and temperature sensing and phase change memories. Chalcogenide glasses comprehensively reviews the latest technological advances in this field and the industrial applications of the technology.Part one outlines the preparation methods and properties of chalcogenide glasses, including the thermal properties, structure, and optical properties, before going on to discuss mean coordination and topological constraints in chalcogenide network glasses, and the photo-induced phenomena in chalcogenide glasses. This section also covers the ionic conductivity and physical aging of chalcogenide glasses, deposition techniques for chalcogenide thin films, and transparent chalcogenide glass-ceramics. Part two explores the applications of chalcogenide glasses. Topics discussed include rare-earth-doped chalcogenide glass for lasers and amplifiers, the applications of chalcogenide glasses for infrared sensing, microstructured optical fibres for infrared applications, and chalcogenide glass waveguide devices for all-optical signal processing. This section also discusses the control of light on the nanoscale with chalcogenide thin films, chalcogenide glass resists for lithography, and chalcogenide for phase change optical and electrical memories. The book concludes with an overview of chalcogenide glasses as electrolytes for batteries.Chalcogenide glasses comprehensively reviews the latest technological advances and applications of chalcogenide glasses, and is an essential text for academics, materials scientists and electrical engineers working in the photonics and optoelectronics industry.

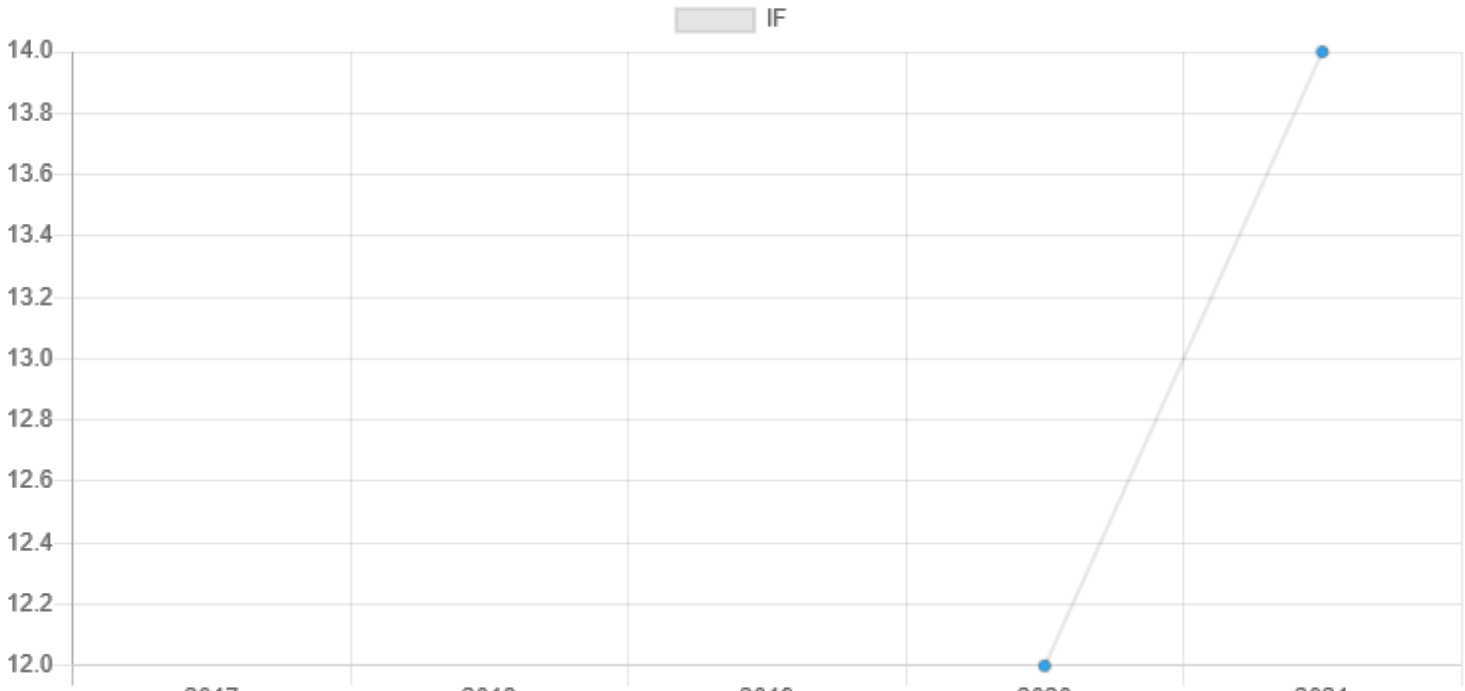
Impact Factor

Impact factor (IF) is a scientometric factor based on the yearly average number of citations on articles published by a particular journal in the last two years. A journal impact factor is frequently used as a proxy for the relative importance of a journal within its field. Find out more: What is a good impact factor? (https://www.scijournal.org/articles/good-impact-factor)

III. Other Science Influence Indicators

Any impact factor or scientometric indicator alone will not give you the full picture of a science journal. There are also other factors such as H-Index, Self-Citation Ratio, SJR, SNIP, etc. Researchers may also consider the practical aspect of a journal such as publication fees, acceptance rate, review speed. (Learn More (https://www.scijournal.org/articles/))



Journal of Ovonic Research H-Index

The h-index is an author-level metric that attempts to measure both the productivity and citation impact of the publications of a scientist or scholar. The index is based on the set of the scientist's most cited papers and the number of citations that they have received in other publications

Abstract

In this paper, we report the enhanced electrochemical characteristic performance of porous gel polymer electrolyte, due to dispersion of sodium aluminate ($NaAlO_2$) active fillers in it. The salt solution consisting of, sodium perchlorate ($NaClO_4$) dissolved in binary mixture of ethylene carbonate and propylene carbonate (EC:PC) was entrapped in poly(vinylidinefluoride-co-hexafluoropropylene) (PVdF-HFP) polymer matrix to obtain the micro-porous sodium ion conducting gel polymer electrolyte films by using the phase inversion technique. Small loading of the active $NaAlO_2$ fillers in gel polymer electrolyte results in significantly improved ionic conductivity (σ_{max}=0.68 mS cm^{-1} at room temperature), Na^+ ion transference number (t_{Na+}~ 0.45) and electrochemical stability window (ESW ~ 4.1 V). Dielectric studies have been performed to explore the ion dynamics in the electrolyte system. The Na-S prototype battery delivers maximum discharge capacities of ~ 210, 139 and 51 mA h g^{-1} at drain currents of 0.10, 0.25 and 0.50 mA cm^{-2}, respectively. The optimized electrolyte composition with high liquid retention, conductivity and transport properties can be utilized for upcoming sodium batteries operating at room temperature.

Introduction

Gel polymer electrolytes (GPEs) have been extensively studied in last decade as a potential electrode separator for batteries and supercapacitors [1,2]. These electrolytes are flexible, free-standing and carry good ionic conductivity (> 0.1 mS cm^{-1}) with sufficient electrochemical stability window like liquid electrolytes. These are liquid-rich systems carrying higher content of liquid electrolyte (LE), a molar solution of specific salt in less/non-volatile and high dielectric constant solvent such as ethyl carbonate (EC), propylene carbonate (PC) and diethyl carbonate (DEC) and various room temperature ionic liquids, immobilized in a solid polymer skeleton. The high ionic conductivity of these electrolyte systems makes them catchy option for supercapacitor application. However, for the applications like rechargeable batteries, where the transport of cations is important, these electrolytes appears not that much attractive. Poly(vinylidinefluoride-co-hexafluoropropylene) (PVdF-HFP) is one of the most studied polymers for GPEs preparation [1,2]. One molecule of this polymer has eight fluorine atoms attached with it. Since, the fluorine is highly electronegative in nature, therefore the transport of Na^+ ion in the vicinity of fluorine atoms is hindered.

In order to deal with this issue, the dispersion of nano/micro-size ceramic fillers in the GPEs is an effective approach. These fillers (neutral and acidic) show Lewis acid-base reactions with the salt and form hydrogen bonding with the anion of the salt and, consequently, set more free cations in the electrolyte [3]. Additionally, these fillers settle in the microstructures of the polymer skeleton and break its crystalline orientation, which plays an important role in improving the ionic mobility and hence ionic conductivity of the GPEs. The thermal and mechanical stability of the GPEs may also be enhanced upon dispersion of ceramic filler. Various GPEs with fillers, like Al_2O_3, SiO_2, ZrO_2, TiO_2, have been reported in last few years for battery applications with superior cationic transference numbers [1,4].

There is another category of fillers, called active fillers, which have specific cation in their structure inherently, such as $LiTi_2(PO_4)_3$ [5], $LiAlO_2$ [6] and NASSICON structured $Li_{1.3}Al_{0.3}Ti_{1.7}(PO_4)_3$ [7] for lithium ion conducting electrolytes, $NaAlO_2$ [8], NASICON structured $Na_3Zr_2Si_2PO_{12}$ [9] for sodium ion conducting electrolytes, MgO [10] and $MgAl_2O_4$ [11] for magnesium ion conducting

electrolytes. These active fillers are inherently ion conducting for favorable cation and form ionic dipoles with high dipole movement in the polymer electrolyte system and hence promote cationic kinetics in the electrolyte system. These fillers have been observed not only to enhance the ionic conductivity but also the cation transport number along with other electrochemical properties. Kim et al. [9] used the $Na_3Zr_2Si_2PO_{12}$ filler, which is inherently a sodium ion conducting material and may suppress the anion mobility in the electrolyte system. They reported NASICON structured $Na_3Zr_2Si_2PO_{12}$ dispersed in PVdF–HFP + 1 M $NaCF_3SO_3$ in TEGDME (LE) electrolyte system. The above electrolyte delivered high ionic conductivity of 0.12 mS cm^{-1} at 0 °C, with exceptionally high cation (Na^+) transference number (t_{Na+}) ~ 0.92 and electrochemical stability window of 5 V. Recently, Pareek et al. [12] reported significant enhancement in Li^+ ion transference number from ~ 0.20 to maximum 0.73 with ionic conductivity jump from 2.35×10^{-6} to 5.76×10^{-5} S cm^{-1} on dispersion of Li-active NASICON-structured $LiSnZr(PO_4)_3$ ceramic filler in PVDF + LiTFSI polymer electrolyte system. Hashmi and his co-workers demonstrated the effective role of active fillers,Na aluminate ($NaAlO_2$) and Mg aluminate ($MgAl_2O_4$), in comparison to the passive Al_2O_3fillers, in the sodium and magnesium ion conducting GPEs, respectively [8,11]. They obtained significant jump in the cationic transference numbers when active fillers were used. Not only cation transport number but active fillers introduce more amorphicity in the polymer chains and also improve thermal stability of the electrolyte system [10]. In general, GPEs are prepared by conventional solution casting technique. In recent years, another approach is being in trend called phase inversion technique for GPE preparation [[13], [14], [15], [16], [17], [18], [19]]. In this technique, a porous polymer film is first prepared, via techniques like electrospinning, use of non-solvents etc, and then activated in specific LE to obtain porous gel polymer electrolyte (PGPE). These electrolytes are easy to prepare, cost effective and mechanically more stable than conventional solution casted gel polymer electrolytes. Yadav et al. [20] have reported a simple and quick method of obtaining porous polymer films just by exposing the polymer solution in steam at elevated temperature. The same group prepared PGPE system comprising ZrO_2 dispersed PVdF-HFP. They obtained maximum ionic conductivity of 0.60 mS cm^{-1} with slightly reduced electrochemical stability window of 3 V [21]. Verma et al. [22] reported the effect of passive TiO_2 nanoparticles on the physical and electrochemical properties of PGPE obtained by the same method. They obtained good ionic conductivity of 1.30 mS cm^{-1} with cationic (Na^+) transference number ~ 0.31 with electrochemical stability window of 3.50 V.

In the present paper, an attempt to enhance electrochemical properties of PVdF-HFP/$NaClO_4$ + EC-PC PGPE is demonstrated using $NaAlO_2$ active fillers. The $NaAlO_2$/PVdF-HFP composite porous films were obtained by phase inversion technique. Ionic conductivity, electrochemical stability window, Na^+ ion transference number (t_{Na+}) and dielectric studies for porous gel polymer electrolytes dispersed with and without $NaAlO_2$ active fillers are presented and explained. A proto-type room temperature (RT) Na-S battery has been assembled and tested for OCV and discharge capacity using the optimized composition of PGPE.

Section snippets

Materials

PVdF-HFP (average M_w 400,000), Sodium aluminate ($NaAlO_2$) powder, Sodium perchlorate ($NaClO_4$) (≥ 98 %), ethylene carbonate (EC) (98 %), propylene carbonate (PC) (99.7 %) and elemental Sulfur (S) were purchased from sigma Aldrich, USA. The solvent dimethyl formamide (DMF) (AR grade) was purchased from SD Fine Chem, India. Activated carbon (AC) was purchased from YEC-8, Fuzhou Carbon Co., China.…

Preparation of PGPEs

The PGPEs were prepared by the phase inversion technique as reported by Yadav et al. [16]. Initially,…

Results and discussions

The variation of porosity and the LE uptake, calculated using Eqs. 1 and 2, of the porous $NaAlO_2$/PVdF-HFP/EC-PC/$NaClO_4$ films with various $NaAlO_2$ contents are drawn in Fig. 2. The porosity of the films is directly connected to their LE uptake which can be clearly seen from the figure. The porosity and LE uptake of the PVdF-HFP film are obtained 69 % and 311 %, respectively this is well in corroboration with earlier reports. On dispersion of $NaAlO_2$ fillers, both these factors, porosity and LE…

Conclusions

PGPE films are prepared using phase inversion techniques and the effect of Na-active $NaAlO_2$ fillers on performance enhancement of porous gel polymer electrolyte has been investigated using electrochemical and dielectric studies. The filler particles enhance the retention of sodium salt solution within gel polymer electrolyte matrix and thus the ionic conductivity of the PGPE significantly increases from 0.22 mS cm^{-1} to maximum 0.68 mS cm^{-1} for optimized composition with 0.50 wt.% $NaAlO_2$. The Na^+…

A Facile Route to Synthesis of Ferromagnetic and Antiferromagnetic Phases of Iron Oxide Nanoparticles by Controlled Heat Treatment of Ferritin

Sunil Kumar, Anjali Thakur, Saral K. Gupta, Parasmani Rajput & Amarjeet Singh

Journal of Superconductivity and Novel Magnetism **33**, 3841–3852 (2020)

259 Accesses | **3** Citations | Metrics

Abstract

Magnetic nanoparticles of ferromagnetic and antiferromagnetic phases were synthesized from controlled heat treatment of dry ferritin powder in a bottom-up approach. Heat treatment paves the way for synthesis of Fe_2O_3 solid phase from iron molecular complexes stored in the cavity of ferritin; the strong increase (~ 150 times) in saturation magnetization is a sign of the presence of ferromagnetic exchange coupling which exists only in solid phase. In this experimental study, vibrating sample magnetometer (VSM) was used to study magnetic induction. X-ray diffraction (XRD) and scanning electron microscopy (SEM) were employed for analysis of structure and morphology of the samples. Differential scanning calorimetry (DSC) was used to search for indicators of structural phase transformation through scanning of temperature. The nanoparticle size with highly narrow distribution (mean size ~ 6 nm) was observed by SEM for sample annealed at 430 °C. As indicated by XRD measurements, the majority phase of Fe_2O_3 nanoparticles was amorphous up to 500 °C, whereas DSC demarcates the crystalline phase transition temperature at 545 °C. The annealing temperature range from 400 to 500 °C was found to be suitable for growing ferromagnetic nanoparticles endowed with high saturation magnetization and low coercivity. At higher range of annealing temperature (500–700 °C), XRD confirms the presence of α-Fe_2O_3 (haematite) phase which is an antiferromagnetic crystalline system with weak magnetization. A systematic decline of magnetization on increasing the annealing temperature beyond 500 °C was attributed to finite size effects and increased purity of antiferromagnetic phase.

ABSTRACT

Thin films of poly (3-hexylthiophene), abbreviated as P3HT, are widely used systems of semiconducting polymer for applications in organic electronic devices. We studied the microstructure of spin-coated thin films of P3HT using grazing incidence x-ray diffraction (GID) by combining high-resolution vertical scan with 2D intensity maps obtained using area detector. Microstructure of the films was quantitatively analyzed in terms of relative crystalline density, texture and coherence length. The structure of the films was relaxed by annealing at 110°C. The relaxed microstructure shows strong thickness dependence. Thick film (61 nm) was highly crystalline and textured. For thin film (32 nm), relative crystalline density was very weak but the coherence length of crystallites was larger and the orientation of crystallites was even more strongly textured. For thick film, the strong increase of crystalline density takes place through fresh nucleation and reorientation of crystallites already present in the films. For thin films, the substrate interaction induced very strong alignment of lamellar crystallites through degeneration of off-oriented crystallites and increased lamellar crystalline

ABSTRACT

Pb additive nanochalcogenide materials are becoming well-known materials in modern optoelectronics. In this paper, multicomponent Se-Te-In-Pb nanochalcogenide alloys are prepared using melt-quenching technique. The physical and submicron structural features of investigated system are reported and discussed. Characteristic peaks in x-ray spectra signify nanorange of each sample under investigation validated by FESEM and HRTEM. Influence of Pb content on examined composition has been deliberated with respect to their physical characterization namely average coordination number (<*r*>), mean bond energy (<*E*>), cross-linking density (*X*), lone-pair electrons (*L*), fraction of floppy modes (*f*), constraints (N_c), electronegativity (χ), cohesive energy (*CE*), glass transition temperature (T_g), and heat of atomization (H_s). It is realized that addition of Pb content, enhanced N_c, *X*, and <*r*>. Whereas, <*E*>, *L*, *f*, χ, *CE*, T_g, and H_s decrease with Pb addition. Cohesive energy is analyzed through chemical-bond approach. T_g is estimated by Tichy-Ticha and Lankhorst approaches and are found in consistent with experimental results. The band gap of investigated system has

deduced results are analyzed through cohesive energy, electronegativity, and average single-bond energy. Also the compositional dependence of experimentally derived optical band gap has been analyzed and discussed.

KEYWORDS: Nanochalcogenide FESEM theoretical band gap mean bond energy cohesive energy glass transition temperature

1. Introduction

In scientific research, the nanostructure configurations are gradually becoming promising materials owing to basic research point of view as well as for their inimitable features as distinctive optical properties, exclusive electronic properties, an enormous surface-to-volume ratio, etc., as contrasted to bulk systems [1,2]. Moreover, the nanostructure synthesis has been analyzed for several materials in consequence of advancement in the characterization and visualization techniques. Recently, the interest has been developed in lead chalcogenide nanocrystalline semiconductors because of their unique size tuneable properties arising from the effect of quantum confinement in addition to have potential applications as detectors of infrared radiation, photosensors, solar energy conversion devices, thermoelectric devices, photodetectors, photoresistors, lasers, nonlinear optical devices, and more recently, as solar control coatings and infrared emitters [3–6].

The metal-containing nanocrystalline materials are well-known promising materials owing to their some unusual properties, including anomalous order of band gaps, high carrier mobility, exclusive chemical durability, high dielectric constant, extended infrared (IR) transparency, high reflection index, low phonon energy, high photo sensitivity, high thermal stability, and special nonlinear optical properties [2,7–9]. These fascinating and incomparable properties of lead nanostructured semiconductors have inculcated great interest in the fundamental studies of these materials. Additionally, multicomponent nanochalcogenide crystals proposed excessive assistance of having tuneable electronic, optical, structural, and defect properties which facilitate photovoltaic properties [10]. Nanochalcogenides materials are not well studied and there is a lot of scope for the study of these materials in a nanorange.

Se-based chalcogenide materials are tremendously utilized in the

Loading [Contrib]/a11y/accessibility-menu.js

[11,12]. These materials are useful in optical memory switching rectifiers and photocells due to observation of reversible transformation [13]. But these Se-based alloys found to be thermally unstable and have limited reversibility for technological applications [2]. However, the insertion of trace elements is one of the most efficient techniques for developing new alloys with improved properties. Huang et al. stated [14] that the atomic packing becomes denser, if atomic radius of element to be added is extensively dissimilar from alloy elements or has analogous chemical characteristics to that of the one element of alloy component. This causes an enhancement in tensile strength, thermal stability, glass-forming ability (GFA), and other mechanical properties [14–16]. The progression of inclusion of Pb in Se-based system effected their band structure along with bonding network. This in turn produces thermally more stable glassy alloys by reducing aging effect and enhancing glass forming ability. Pb doping prominently makes an impact on physical, structural, electronic, optical, and thermal properties of host material [2,17]. Our preceding research on ternary Se-Te-In composition signifies that In = 6 at. wt.% has greater thermal stability among investigated alloys [18,19]. Furthermore, in our earlier measurements on AC conductivity and dielectric study in Se-Te-Pb system illustrate considerable influence of Pb addition on conduction mechanism [17]. The fundamental interest in multicomponent quaternary chalcogenide alloys has been revived due to the observation of quick reversible laser-induced crystalline to amorphous and amorphous to crystalline phase transitions. Quaternary chalcogenide alloys act as considerable source of tuneable emission in IR wavelength region [2,20,21]. In device fabrication, the lattice perfection and the optical gap of the material plays an important role which can be modified by the insertion of the doping element like Pb. The insertion of trace element like Pb may enhance the valance alteration pair (VAP)-type defects, limiting molecular mobility, and connecting neighboring chains, which causes *p* to *n* transition in certain chalcogenide systems [2,17]. All these eminent characteristics indicate that Pb is exclusive amongst the trace element in case of semiconducting chalcogenide materials.

The advancement in the characterization and visualization techniques opens up a new window in materials science for controlling synthesis of materials at nanolevel. The growth of nanostructured materials by simple and economic methods becomes important in the field of fabrication of nanoscale devices. The rapid growth in nanotechnology and nanoscience will bring us in a new world. Exploring new techniques that comprise

Loading [Contrib]/a11y/accessibility-menu.js

fabrication of nanostructured materials with desirable features, controllable dimensions together with morphologies is recently a great challenge to both synthetic chemists as well as materials scientists. To produce monodisperse nanocrystals of Pb chalcogenides with high quality, tuneable size and shape; it is significant to understand their nanocrystal formation process. In the past few years, the various novel techniques have been established for the synthesis of nanocrystalline semiconducting metal chalcogenides including microwave-assisted heating, sol-gel method, solvothermal technique, thermal evaporation, sonochemical method, photochemical synthesis, sonoelectrochemical method, microemulsion route, electrochemical template synthesis, high-energy ball milling, sputtering, pulse laser deposition, etc. [22–33]. In the present study, nanomaterials synthesis is achieve by using melt quenching technique as this is a simplest, most cost effective as well as proven technique for producing high-quality nanomaterials along with optimum stoichiometry and morphology [5,34–38]. Other researchers also reported that the progression of inclusion of Pb additives have considerable influence on the growth of nanocrystalline semiconducting chalcogenide materials [1,2,3,4,5,6,22,23,24,25,26,27,28,29,30,31,32,33,39,40,41,42,43]. In some cases, Pb additive act as a modifier in the host system by increasing the number of defects. Consequently, crystalline size reduced with Pb addition as observed by others [40–42]. Due to all these eminent characteristics of Pb; in the present work also, Pb is used as a doping element for synthesis of nanochalcogenide alloys.

The physical properties of nanochalcogenide alloys have received much attention because of their attractive unpredictable features and extensive range of structural network alterations [43], which is essential for understanding the materials properties in addition to materials engineering. The variation in composition brings changes in short-range order which helpful in tailoring the properties of glassy materials to a desired requirement [44]. Further, the evaluation of physical parameters is useful to explore the best characteristics of the system and can predict the stability of a glass system to greater extent, making it easier for the selection and solution of the problem before performing experiment.

In the present research paper, influence of Pb content on investigated system have been studied with respect to their physical parameters via average coordination number (<*r*>), mean bond energy (<*E*>), cross-linking density (*X*), lone-pair electrons (*L*),

Loading [Contrib]/a11y/accessibility-menu.js

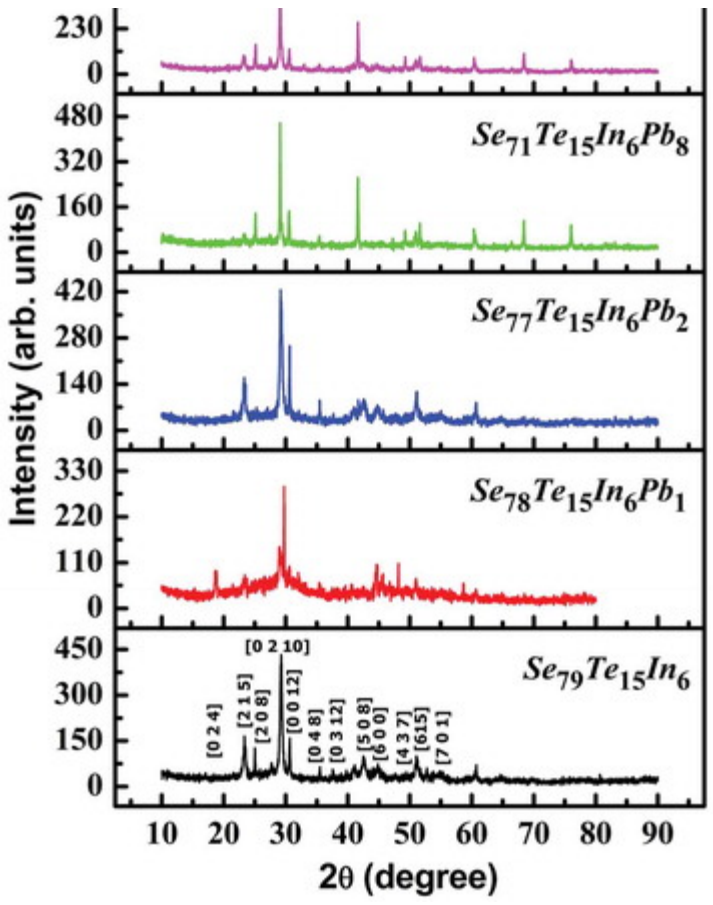
cohesive energy (CE), glass transition temperature (T_g), heat of atomization (H_s), etc. X-ray diffraction (XRD) technique is used for analyzed nanocrystalline nature of primed samples. Elemental composition of investigated samples is analyzed through energy-dispersive x-ray (EDX) analysis. Surface morphology and nanonature of examined composition is validated by field emission scanning electron microscope (FESEM) and high-resolution transmission electron microscope (HRTEM). The optical measurements are used to find the band-gap values. A correlation is established among the mean coordination number and other deduced physical parameters.

2. Experimental details

Nanochalcogenide $Se_{79-x}Te_{15}In_6Pb_x$ (x = 0, 1, 2, 4, 6, 8, and 10 at. wt.%) alloys are synthesized by melt quenching process. Pure (99.999%) element as per at. wt.% has been pondered with 10^{-4} g accuracy and sealed in (diameter ~ 12 mm, length ~ 5 cm) quartz ampoule under a vacuum ~ 2×10^{-5} mbar. Heating of sealed ampoules has been done at 3–4°C min^{-1} heating rate up to 900°C for 10 h and ampoules were frequently rocked to make the melt homogenous at maximum temperature. The quenching of molten sample has been performed very quickly in ice-cooled water. Deduced sample is grinded into a fine powder. Structural analysis is done at room temperature by taking XRD pattern of the examined samples through PANalytical X'Pert x-ray diffractometer in $10° < 2\theta < 90°$ range at 1°/min scanning rate using Cu $K\alpha$ (λ = 1.54056 Å). The investigation of premier characteristic peaks in the XRD spectrum signifies the nanonature of examined alloys. XRD spectra of nanocrystalline chalcogenide $Se_{79-x}Te_{15}In_6Pb_x$ (x = 0, 1, 2, 8, and 10 at. wt.%) alloys have been plotted in Figure 1 and for x = 4 and 6 at. wt.% of Pb is shown in our other research papers [2,41]. Diffraction peaks and observed d spacing of investigated alloys match closely with those of the standard JCPDS card no.: 76-1182. All the observed nanocrystalline peaks in XRD spectra (Figure 1) can be perfectly indexed to the rhombohedral structure of Se-Te-In and indexed as (0 2 4), (2 1 5), (2 0 8), (2 2 0), (2 1 $\bar{8}$), (0 2 10), (0 0 12), (0 4 8), (0 3 12), (1 3 $\overline{11}$), (2 4 $\bar{2}$), (1 4 $\bar{9}$), (5 0 8), (0 1 17), (6 0 0), (4 2 $\overline{10}$), (4 3 7), (6 1 5), and (7 0 1) crystal planes. XRD study clearly reveals that no characteristics peaks related to impurities or other precursor compounds in pure and doped Se-Te-In alloys has been observed. XRD patterns of synthesized nanochalcogenides clearly reveal a preferred orientation along (0 2 10) direction [corresponding to $2\theta \approx 29°$], as this diffraction peak shows significantly high intensity and narrow width as compared

Loading [Contrib]/a11y/accessibility-menu.js

nature (as indicates by diffraction patterns) and broadening in peak signifies nanocrystalline nature. Presence of high strain and large numbers of defects might be the other reason which contributes to peak broadening [45,46]. The envelope of various reflections peaks at lower angles further provides the confirmation of narrow size distribution of investigated system (Figure 1). It is observed that prominent (0 2 10) phase remains unaltered, however, becomes more sharp and intense with increasing Pb content. This observation illustrates that crystallinity of Se-Te-In nanocrystals enhance with Pb doping. As Pb concentration increases, intensity of (0 2 4), (2 1 5), (2 0 8), and (600) plane peaks decreases whereas intensity of (0 2 10), (0 0 12), (0 4 8), and (5 0 8) plane peaks increases; coupled with appearance of minor peaks at $2\theta \approx 49.10°$, 52.78°, 68.34°, and 76.02° (corresponds to rhombohedral structure of Se-Te-In). In addition, it is observed that preferred orientation along (0 2 10) direction changes to (5 0 8) direction with Pb doping. The minimization in surface energy and internal stress might be dominating the occurrence of preferential orientation [47–52]. These observations reveal that growth direction of examined nanocrystalline composition changes with Pb amount. It also signifies the polycrystalline nature of doped nanocrystalline composition. The Scherrer's formula [17] has been used for deducing average crystallite size (D_{XRD}) of investigated alloys:



(1)

$$D_{\mathrm{XRD}} = K\lambda / \beta \cos\theta$$

(1)

Figure 1. XRD patterns at various concentrations of Pb in nanocrystalline chalcogenide $Se_{79-x}Te_{15}In_6Pb_x$ (x = 0, 1, 2, 8, and 10 at. wt.%) alloys.

Loading [Contrib]/a11y/accessibility-menu.js

Display full size

where K denotes the Scherrer constant (K = 0.9), D indicates the crystalline size, θ is the peak position, β is full width at half maximum (FWHM) of the premier intense peak in XRD spectrum used to realize the crystallite size for each investigated alloy and λ signifies x-rays wavelength. The crystallite size of all investigated chalcogenide nanoparticles found to be in nanorange between 12.4 and 49.38 nm (Table 1, Figure 2). The amount of defects and imperfections in crystal lattice can be provided by dislocation density (δ) of system and is calculated by using the relation [50]:

(2)

$$\delta = 1 / D_{\mathrm{XRD}}^{2}$$

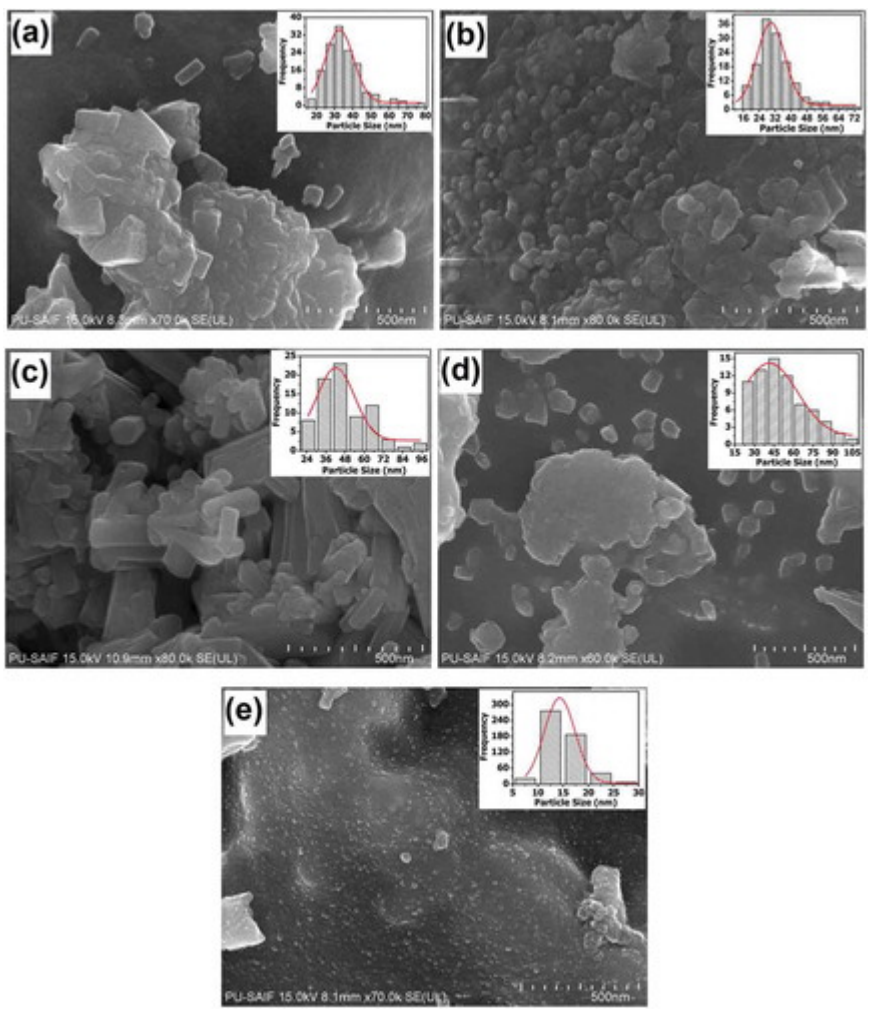
Moreover, microstrain (ε) developed owing to displacement of atoms with respect to their reference lattice position. ε is determined by following relation [52]:

$$\varepsilon = \beta \cos\theta / 4 \quad (3)$$



The deduced values of δ and ε are given in Table 1. Variation in crystallite size is observed with enhancing Pb content, further, confirmed by dislocation density, microstrain along with crystalline nature of examined composition. Presence of high strain, large numbers of defects, ionic radii mismatch among doping element and host ion, drag force exerted by dopant ions on grain growth, and boundary motion might contributes to this variation in crystallite size [46]. The highly intense structural peak is observed at $2\theta \approx 29°$ in the XRD pattern for all investigated samples. Moreover, the shift is in the direction of lower value of 2θ that indicates contraction of crystal structure along with extension of lattice parameters due to replacement of Se by Pb [1,17]. This shift can be attributed to an increase in grain size, lattice spacing, dislocation densities, and microstrain, which is due to imperfections within the crystalline lattice. Sharp discrete peaks having lower intensity than the most intense peak are also observed due to inclusion of Pb in Se-Te-In system. Consequently, Pb may create most stable state by compensate disorder in the investigating system.

Surface morphology as well as nanocrystalline nature of examined system is further analyzed by FESEM (HITACHI-SU8010) operating at accelerating voltage of 15 kV; which indicates good consistency with XRD outcome. Figure 3((a)–(e)) shows the few scanned images of multicomponent nanochalcogenide $Se_{79-x}Te_{15}In_6Pb_x$ (x = 0, 1, 2, 8, and 10 at. wt.%) alloys and FESEM images of 4 and 6 at. wt.% of Pb are given elsewhere in our earlier papers [2,41]. Inset histogram of Figure 3((a)–(e)) indicates the

Loading [Contrib]/a11y/accessibility-menu.js

corresponding FESEM images and their respective values of average particle size (D_{FESEM}) are listed in Table 1. Average particle size deduced from FESEM measurements is not consistent with crystallite size estimated through XRD analysis and may be due to unsymmetrical and nonuniform nanoparticles distribution. That is nanoparticle distribution has either long right or left tail. Consequently, mean value is not same at point of maxima in distribution [53,54]. These scanned images reveal almost rod and spherical shapes of nanoparticles in scanned area of examined composition. These nanoparticles are not perfectly spherical and exhibit significant faceting; which contributes to broad size distributions of nanocrystals [55,56] contribute to inconsistency in FESEM and XRD measurements. Further, with increasing Pb content, average crystallite size deduced from XRD varies as compare to particle size analyzed through FESEM. This reveals that polycrystalline nature of nanocrystals approaching toward nearly single crystalline nature [48,57].

Figure 3. FESEM micrographs of $Se_{79-x}Te_{15}In_6Pb_x$ (x = 0, 1, 2, 8, and 10 at. wt.%) nanochalcogenide alloys (a) ×70 k (for x = 0), (b) × 80 k (for x = 1), (c) × 80 k (for x = 2), (d) × 60 k (for x = 8), and (e) × 70 k (for x = 10). (Inset for all figures shows nanocrystalline particle size distribution).

The surface morphology and size of primed nanochalcogenide composition is further characterized by HRTEM analysis. The TEM measurements are performed through FP-5022/22-Tecnai G2 20S-Twin ultrahigh-resolution TEM with scanning-mode TEM (STEM)

Loading [Contrib]/a11y/accessibility-menu.js

primed by dispersing small amount of powder in ethanol solution followed by sonication (ultrasonic vibration) for 30 min. After that a drop of dispersion is placed onto a copper grid; which is coated by layer of amorphous carbon (holey). Figure 4 shows TEM images, HRTEM images, and selected area electron diffraction (SAED) pattern of as-synthesized nanochalcogenide $Se_{71}Te_{15}In_6Pb_8$ alloy. Images with different magnification are shown in Figure 4((a)–(c)). These micrographs illustrate the nearly spherical shape of nanoparticles as validated by FESEM. The nanocrystals shapes are not perfectly spherical and exhibit significant faceting; which contributes to broad size distributions of nanocrystals. The average particle size of primed nanoparticles has been estimated by statistical analysis of nanoparticles and is found equal to ≈ 51.50 nm, as indicated in the histogram (Figure 4 (e)).

Figure 4. (a)–(c) TEM micrographs at different magnifications; (d) HRTEM image; (e) nanocrystalline size histogram; and (f) SAED pattern of nanocrystalline $Se_{71}Te_{15}In_6Pb_8$ chalcogenide system.

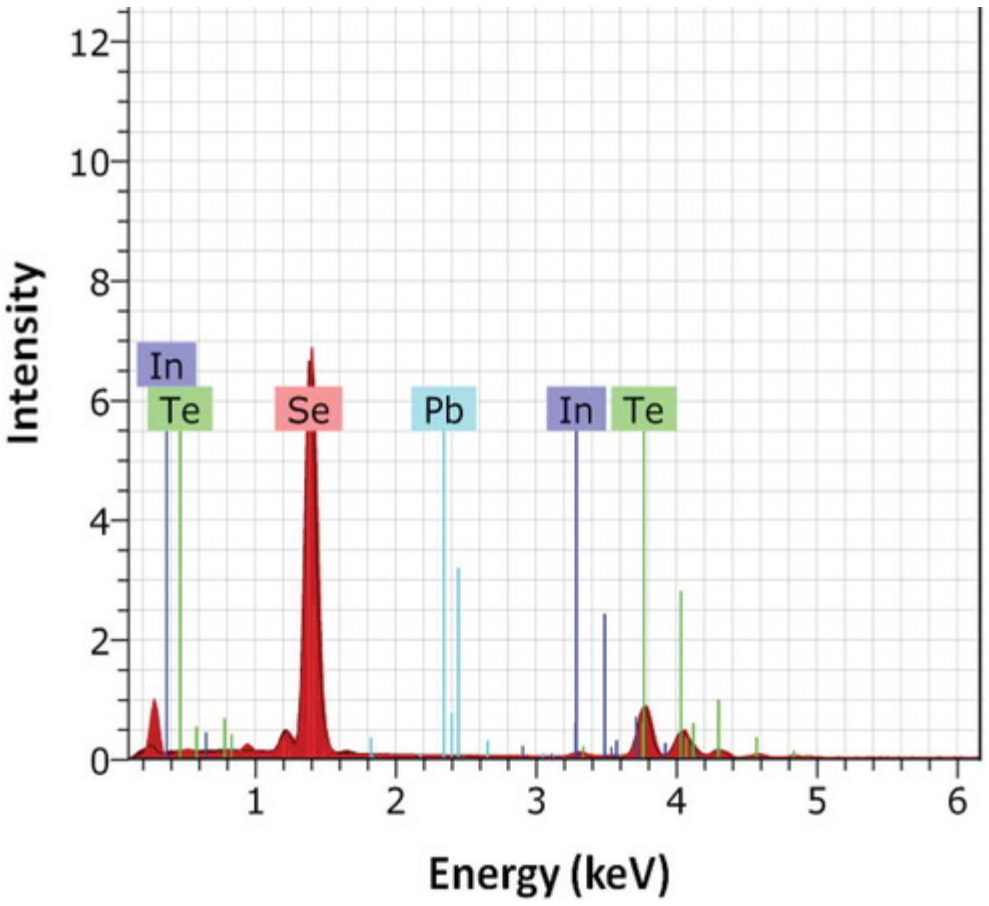
In addition HRTEM analysis is further used to confirm the crystallinity and structure of nanoparticles. High-resolution TEM micrograph (Figure 4 (d)) assures the high-quality crystallinity of these nanocrystals with lattice spacing of ≈ 0.52 nm, which corresponds to [024] plane of rhombohedral structure of Se-Te-In (see JCPDS card no.: 76-1182) and is in accordance with the results of XRD analysis. The corresponding SAED pattern (Figure 4 (f)) of

Loading [Contrib]/a11y/accessibility-menu.js

polycrystalline nature of nanoparticles. These rings are indexed with (0 0 12), (0 2 10), (2 0 8), (2 1 5), and (0 2 4) planes of rhombohedral structure of Se-Te-In (see JCPDS card no.: 76-1182), respectively. These crystalline planes are in consistent with that of measured XRD principal peaks and confirm that primed Se-Te-In nanoparticles are composed of pure phase. Although diffraction rings are discontinuous as well as consist of sharp and bright spots (as shown in Figure 4 (f)) reveals that nanocrystals are well crystallized and approaching toward nearly single crystalline nature. Also, it is observed that average particle sizes (D_{TEM}) lies in nanorange between 12.01 and 51.59 nm for all investigated alloys (Table 1). HRTEM measurements are in agreement with XRD and FESEM analysis, which reflects nearly single crystalline nature of investigated composition as well as validate the nanonature. Scherrer's formula calculates the coherence length of x-ray and any crystal imperfections will leads to smaller deduced size as compare to true size [58]. In our composition, the deduced TEM particle size are close to estimated XRD crystallite size, at least in (0 2 10) direction.



Elemental composition of primed samples is verified using EDX data. Compositional analysis has been carried out on different sections of the examined composition to investigate the chemical composition, formation, and purity of the synthesized Pb-doped Se-Te-In samples. Figure 5 shows the EDX spectrum of nanochalcogenide $Se_{79}Te_{15}In_6$ alloy. The composition of the bulk $Se_{79}Te_{15}In_6$ sample is found to be uniform within the measurement accuracy of about ± 2% (Table 2). Similar results are also observed in the other investigated samples within the experimental error (not shown here). Moreover, neither carbon (C) nor nitrogen (N) signal has been observed in the EDX spectrum. Both XRD and EDX characterization illustrate that pure Se-Te-In nanocrystals are successfully primed through mentioned melt-quench technique.

The thermal behavior of material has been analyzed through differential scanning calorimetry (DSC) technique in nonisothermal conditions. The precision of heat flow is ± 0.01 mW and precision of temperature is ± 0.1°C as deduced by microprocessor of thermal analyzer. A standard aluminum pan has been used to encapsulate a sample of around 3–5 mg at a flow of 40 mL/min which is in powder form, under dry nitrogen atmosphere. Samples are heated at heating rates: 5, 10, 15, and 20°C min^{-1}. Characteristic temperatures: the glass transition temperature, peak temperature of crystallization (T_p), and melting temperature (T_m) are deduced by microprocessor of thermal analyzer. A typical DSC thermogram of studied Se-Te-In-Pb nanochalcogenide system at heating rate 10°C min^{-1} is shown in Figure 6.

Figure 6. DSC thermograms of the nanocrystalline $Se_{79-x}Te_{15}In_6Pb_x$ (x = 0, 1, 2, 4, 6, 8, and 10) multicomponent chalcogenide system at 10°C min^{-1} heating rate.

Thin films of Se-Te-In-Pb investigated nanocrystalline samples has been deposited on thoroughly clean microscope glass substrates by well-known vacuum flash evaporation technique using molybdenum boat (HINDHIVAC 12A 4D Model). Since thin films are not self-supporting, therefore, a suitable substrate is used for deposition. During the evaporation process, a vacuum ~10^{-5} mbar has been retained in the deposition chamber. The primed films are kept inside the deposition chamber for 24 h to achieve a metastable equilibrium. The optical transmittances of the thin films are carried out at nearly normal incidence of light in the wavelength range 400–3000 nm by using UV-Vis-NIR spectrophotometer (Perkin Elmer Lambda-750) at room temperature.

3. Results and discussion

3.1. Average coordination number and constraints

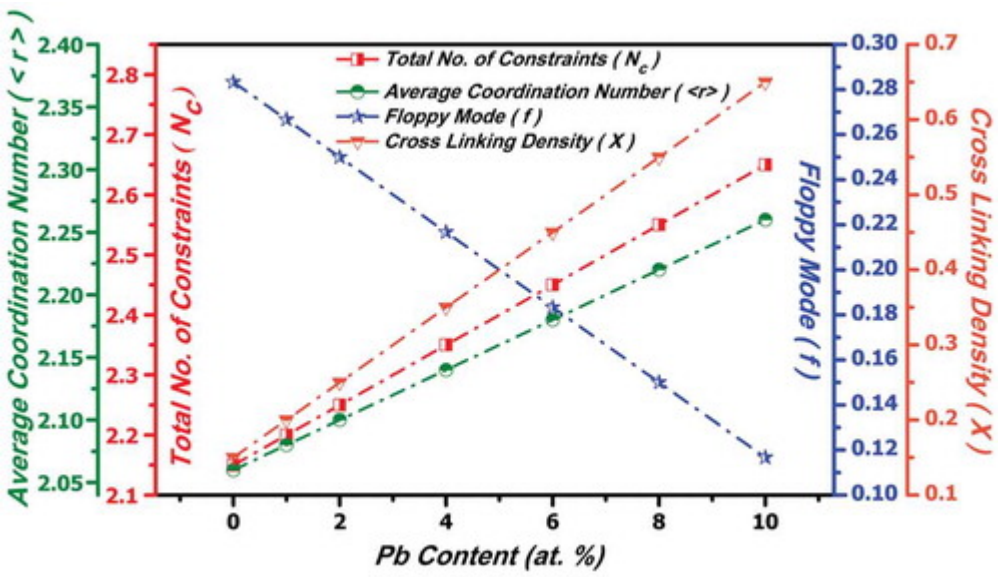
The concept of average coordination number (<*r*>) was introduced by Phillips [44] for use with binary alloys and this idea is extended to depict properties of covalent chains forming glasses. In multicomponent covalent-bonded glassy alloys, degree of cross linking is often connected with <*r*>. Hence, it is an essential factor for demonstrating physical and structural parameters in glassy alloys. For Se-Te-In-Pb investigated nanochalcogenide system, average coordination number is evaluated by relation [59]:

(4)

$$<r> = \frac{\alpha N_{\mathrm{Se}} + \beta N_{\mathrm{Te}} + \gamma N_{\mathrm{In}} + \delta N_{\mathrm{Pb}}}{\alpha + \beta + \gamma + \delta}$$

(4)

where *α, β, γ*, and *δ* denote at. wt.% of Se, Te, In, and Pb,



Loading [Contrib]/a11y/accessibility-menu.js

Table 3 (Figure 7). It is observed that <*r*> increases from 2.06 to 2.26 with Pb addition indicates the cross linking of chains among the atoms increases. Accumulation of fourfold-coordinated Pb leads to three-dimensional network; consequently, increases average coordination number. The increase in <*r*> promotes network strength and rigidity. As value of <*r*> is less than 2.4, therefore network of glassy alloy can be considered as floppy. Hence, the system under examination is a tremendous glass former.

Table 3. Values of average coordination number (<r>), bond-bending constraints (N_β), bond-stretching constraints(N_α), total number of constraints (N_c), cross-linking density (X), lone-pair electron (L), floppy modes (f), and deviation from stoichiometry (R) for nanocrystalline $Se_{79-x}Te_{15}In_6Pb_x$ (x = 0, 1, 2, 4, 6, 8, and 10) chalcogenide system.

Figure 7. Variation of total number of constraints (N_c), average coordination number (<*r*>), floppy mode (*f*), and cross-linking density (*X*) with Pb content for nanocrystalline $Se_{79-x}Te_{15}In_6Pb_x$ (*x* = 0, 1, 2, 4, 6, 8, and 10) multicomponent system.

Display full size

Phillips, Thorpe, and Tanaka [60] demonstrated theories of constraint, according to which there exist two topological thresholds: first one is mechanical thresholds which occur at 2.4; second, the chemical thresholds which correspond to 2.67. They also demonstrated that the chalcogenide system with <*r*> less than 2.4 are loosely connected or under constrained (“floppy” or “spongy” or “polymeric glasses”) and glasses with <*r*> > 2.4 are

Loading [Contrib]/a11y/accessibility-menu.js

solids) [60]. Therefore, it has been predicted that $r = 2.4$ recognized as rigidity percolation threshold; at which number of interatomic force constraints per atom equal to the number of degree of freedom per atom (N_d) available in the network [60]. Whereas $<r> = 2.67$ recognized as chemical threshold which relates two-dimensional to three-dimensional network structural transitions [61]. The mechanical constraints mainly contained two types of constraints: (i) bond-stretching constraints per atom (N_α) and (ii) bond-bending constraints per atom (N_β), which are given by $<r>/2$ and $2<r>-3$, respectively [61]. In covalent-bonded glasses, N_β and N_α appear due to angular forces and radial force, respectively. Therefore, total number of mechanical constraints per atom (N_c) equal to the average of bond-stretching with bond-bending constraints is $N_c = N_\alpha + N_\beta$.

Thorpe [62] proposed that uncoordinated networks possess a finite fraction of zero frequency normal vibrational modes (floppy modes), which is calculated by using the relationship:

(5)

$$f = 2 - \frac{5}{6} <r>$$

(5)

The cross-linking density (X) is deduced by relation [59]:

(6)

$$X = N_c - 2$$

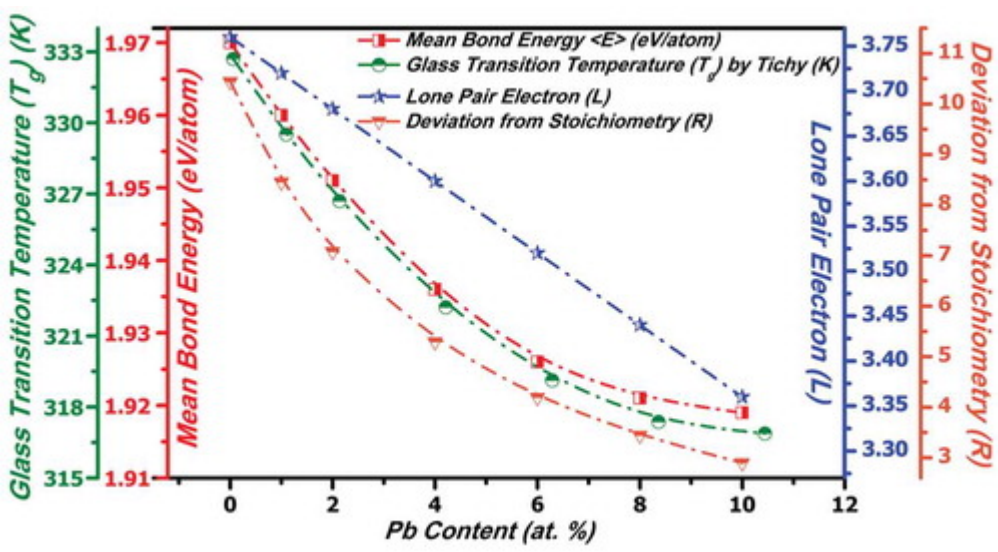
(6)

The deduced values of N_c, f, and X are listed in Table 3. Variation of total number of constraints and cross-linking density against at. wt.% of Pb plotted in Figure 7 and observed that the values of N_c and X increase with the increase in Pb content. According to Phillips and Thorpe [61], the optimum condition intended for glass formation occurs when N_c is equivalent to degree of freedom N_d, i.e. when $N_c = N_d = 3$. In the investigated composition, N_c – › 3 with Pb content; which indicates that number of constraints N_c operating on network stabilized by degree of freedom accessible from the atoms in the network. Also, it is found that value of f – › 0 (Figure 7). This defines a floppy to rigid phase transition, consequently, system becomes more and more rigid, which shows that investigated system have a stronger tendency for making glass [59].

3.2. Glass forming ability and lone-pair electrons

Lone pair of electrons (L) defined as nonbonding pair of electrons exists in valence band. The stable vitreous state has been achieved if adequate amount of L occur in chalcogenide system. Valence shell electron pair repulsion theory can be used to

Loading [Contrib]/a11y/accessibility-menu.js



pair electron occurrence favors the formation of glass by removing strain force in the system. Phillips [44,62] has proposed a relation for calculating *L* in a semiconducting chalcogenide system as given below:

$$L = V - \langle r \rangle \quad (7)$$

(7)

where *V* denotes valance electrons. Zhenhua [63] suggested a simple criterion to check glass forming proficiency of chalcogenide glasses according to which for binary system, *L* should be greater than 2.6 and for a ternary system, *L* should be greater than 1. The calculated values of *L* are tabulated in Table 3 and its variation with Pb additive shown in Figure 8. It depicts that *L* decreases with Pb content. Decrease in *L* can be understood in term of interaction among lone-pair electron of bridging Se atom and Pb ion. Due to this interaction in the system *L* decreases. It is observed that values of *L* are greater than three for investigated system, hence, composition under consideration have good glass-forming tendency.

Figure 8. Plot illustrating the variation of various physical parameters with Pb content for $Se_{79-x}Te_{15}In_6Pb_x$ (x = 0, 1, 2, 4, 6, 8, and 10) nanocrystalline compositions.

3.3. Deviation from stoichiometry, mean bond energy, and prediction of glass transition temperature

Deviation from stoichiometry is expressed by a parameter *R*, which is described as a ratio of covalent-bonding assumptions of chalcogen atoms to that of nonchalcogen atoms [44]. Threshold occurs at *R* = 1 and at this point only heteropolar bonds occur. The composition is regarded as chalcogenide rich, if *R* is greater than 1. Although the composition is consider as chalcogen poor, if *R* is less than 1.

Loading [Contrib]/a11y/accessibility-menu.js

using the following relationship [64]:

$$R = \alpha \times N_{\mathrm{Se}} + \beta \times N_{\mathrm{Te}}\gamma \times N_{\mathrm{In}} + \delta \times N_{\mathrm{Pb}} \quad (8)$$

The deduced values of R are plotted in Figure 8 (Table 3) and it is observed that $R > 1$ for investigated composition. So it reasonable to state that system under investigation is chalcogen rich.

Glass transition temperature (T_g) denoted a point, at which a transition happen and below T_g, supercooled liquid forms a glass. Thus, it is logical to assume that magnitude of cohesive forces inside the material is related to T_g and to allow the atomic movement, these forces should be overcome. In chalcogenide glasses, huge attention is given to prediction of T_g and is related to mean bond energy (<E>), this represent the material rigidity as well as cohesive forces. Tichy and Ticha have been related T_g with connectedness of the material, i.e. with <r> and mean bond energy among atoms of the material, i.e. quality of connections [63–65]. They were considered the covalent-bond approach for chalcogenide systems and gave a correlation among T_g and <E> as given below:

$$T_g = 311[38; <E> - 38; 0.9] \quad (9)$$

There is one another empirical relation proposed by Lankhorst [66], which gives a correlation among enthalpy of atomization H_s (kJ/g-atom) and T_g (K) given as:

$$T_g = 3.44\, H_s - 480 \quad (10)$$

T_g and properties of glassy system are closely related to overall <E>, depends on parameters like degree of cross linking, average coordination number, and bond energy along with nature of the bonds. For investigated composition, <E> has been evaluated by using the correlation given by Tichy [67]:

$$<E> = E_{cl} + E_{rm} \quad (11)$$

where E_{cl} denotes the overall participation to the bond energy occur due to strong heteropolar bonds and E_{rm} indicates the contribution occur due to weaker bonds that left behind strong bonds have been maximized.

$$E_{cl} = P_r\, D_{hb} \quad (12)$$

Loading [Contrib]/a11y/accessibility-menu.js

here D_{hb} is average heteropolar-bond energy and P_r denotes degree of cross linking. Estimated values of <*E*> are summarized in Table 4 and it is found that <*E*> decreases with Pb addition. Values of T_g deduced from Tichy-Ticha and Lankhorst approaches are tabulated (Table 4) and shown in Figure 8 and depicting the fall in T_g with the increase in Pb content. In the investigated system, Pb replaces Se-Se homopolar bonds (44 kcal/mol) with Pb-Se heteropolar bonds (31.47 kcal/mol) [17] leads to decrease in bond energy of system; hence, T_g. Experimental values of T_g for investigated composition are also listed in Table 4 and are in agreement with theoretically predicted T_g using Tichy-Ticha and Lankhorst approaches.

Table 4. Values of average single-bond energy (H_s/<*r*>), heat of atomization (H_s), mean bond energy (<*E*>), glass transition temperature T_g (K), and band gap (E_g^{th}) for $Se_{79-x}Te_{15}In_6Pb_x$ (x = 0, 1, 2, 4, 6, 8, and 10) nanocrystalline chalcogenide compositions.

Download CSV Display Table

3.4. Average heat of atomization, average single-bond energy, and theoretical band gap

The average heat of atomization ($\overline{H}_s$) is a parameter that reflects relative bond strength of a material as it directly provides a measure of cohesive energy. It represents a heat change in a chemical substance by total separation of all atoms (either a chemical element or a chemical compound) [44]. Thus, assets of chalcogenide system must be correlated with $\overline{H}_s$. Pauling stated that [68] for binary semiconductor consist of A along with B atoms, at standard pressure as well as temperature, the $\overline{H}_s$ is the sum of heat of formation (ΔH) with average heats of atomization H_s^{A} and H_s^{B}, respectively, that related to the average nonpolar-bond energy of the two atoms:

(13)

$$H_s\,(\mathrm{A}\text{ - }\mathrm{B}) = \Delta\mathrm{H} + \frac{1}{2}\,[38; \mathrm{H_s^A} + \mathrm{H_s^B}]$$

(13)

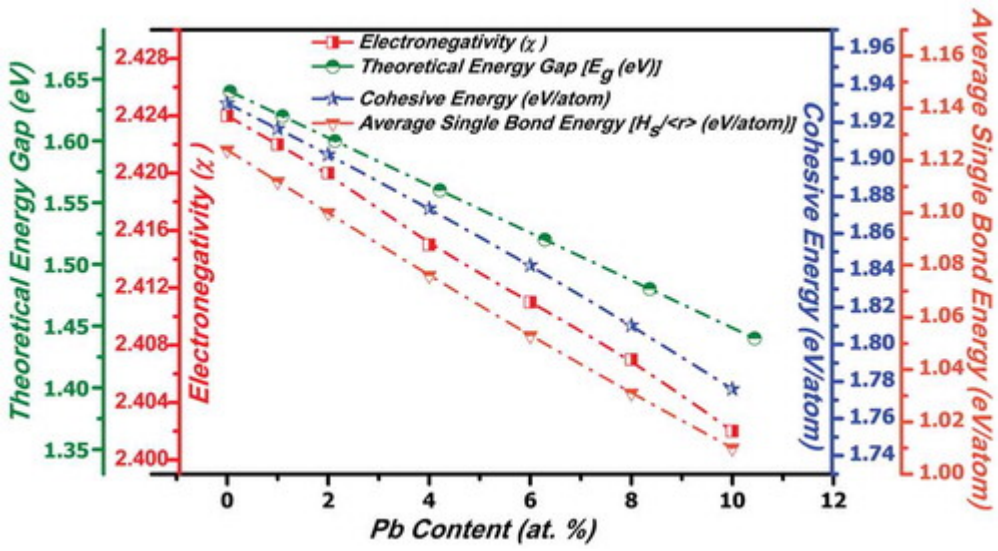
Here ΔH term is related to the square of difference among electronegativity χ_{A} and χ_{B} of two atoms.

(14)

$$\Delta H \quad \alpha \quad (\chi_{\mathrm{A}} - \chi_{\mathrm{B}})^2$$

(14)

Loading [Contrib]/a11y/accessibility-menu.js



$Se_\alpha Te_\beta In_\gamma Pb_\delta$ as a direct assess of cohesive energy which is expressed as:

$$\overline{H}_s = \alpha H_S^{Se} + \beta H_S^{Te} + \gamma H_S^{In} + \delta H_S^{Pb} \alpha + \beta + \gamma + \delta \quad (15)$$

(15)

here H_S(Se) = 227 kJ/mol, H_S(Te) = 197 kJ/mol, H_S(In) = 243 kJ/mol, and H_S(Pb) = 195 kJ/mol are average heat of atomization values for Se, Te, In, and Pb, respectively [44,68]. Deduced values of $\overline{H}_s$ and $\overline{H}_s$/<*r*> are tabulated (Table 4). Figure 9 represents the variation of $\overline{H}_s$/<*r*> with Pb. $\overline{H}_s$/<*r*> indicates the bond strength. It is clearly examined from Figure 9 and Table 4 that $\overline{H}_s$ and /<*r*> decreases with increasing Pb concentration. Reduction in $\overline{H}_s$ and $\overline{H}_s$/<*r*> may be attributed to substitution of stronger Se-Se bonds (bond energies 44 kcal/mol) with weaker Pb-Se bonds (bond energies 31.47 kcal/mol) [17,44], may cause lowering of overall energy of system, consequently, specifies a decrease in cohesive energy [69].

Figure 9. Variation of various physical parameters with Pb additive for $Se_{79-x}Te_{15}In_6Pb_x$ (x = 0, 1, 2, 4, 6, 8 and 10) nanocrystalline chalcogenide system.

Display full size

The energy gap (E_g^{th}) for nanochalcogenide Se-Te-In-Pb multicomponent composition is computed theoretically using Shimakawa relation [70] given as:

$$E_g^{\mathrm{th}}\mathrm{Se-Te-In-Pb} = \alpha E_g\mathrm{Se} + \beta E_g\mathrm{Te} + \gamma E_g\mathrm{In} + \delta E_g\mathrm{Pb} \quad (16)$$

(16)

where E_g(Se) = 1.95 eV, E_g(Te) = 0.65 eV, E_g(In) = 0 eV, and E_g(Pb) = 0 eV represent the energy gap for the elements in braces. Figure 9 indicating the variation of $\overline{H}_s$/<*r*> with Pb content. It is observed that energy gap decreases by Pb addition in investigated Se-Te-In-Pb system and may be explained by correlating the energy gap to

Loading [Contrib]/a11y/accessibility-menu.js

E_g^{th} of the system can be explained in term of decrease in electronegativity (χ) with increasing Pb at. wt.% (Tables 4 and 5). In chalcogenide system, the top of valence band is form by Se atom lone pair and the bottom of conduction band is form by antibonding band [17,71]. When electropositive In atom (χ = 1.78) is replaced by electronegative Pb atom (χ = 2.33), the lone-pair energy gets augmented along with valence band shift toward energy gap [17,71], which may cause lowering in energy band gap. This might be apparent from Table 5 with decreasing electronegativity values.

Table 5. Values of cohesive energy (*CE*), distribution of their respective bonds, optical band gap (E_g^{opt}), and electronegativity (χ) for $Se_{79-x}Te_{15}In_6Pb_x$ (x = 0, 1, 2, 4, 6, 8, and 10) nanocrystalline chalcogenide system.

Download CSV Display Table

3.5. Cohesive energy and electronegativity

Cohesive energy (*CE*) is described as the quantity of energy (normalized per atom, per electron, etc.) which attains by a material to be in a solid phase. Therefore, in solid, cohesive energy is illustrated as energy required for breaking all bonds present within its constituent atoms. Chemical-bond approach (CBA) [72] is used for evaluating cohesive energy (the stabilization energy of infinitely large clusters of material per atom). According to CBA model, heteropolar bonds occur more easily (firstly) as compare to homopolar bonds and the bonds are appeared in succession of lowering bond energy unless existing valence of atoms are satisfied. Additionally, bond energies have additive nature. Cohesive energy is determined by adding bond energies of all bonds expect in examined system as given below:

(17)

$$CE = \frac{\sum_i C_i D_i}{100}$$

(17)

here C_i denotes the number of expected chemical bonds and D_i indicates energy of corresponding bonds. Sanderson's principle [73] has been used for calculating the electronegativity (χ) for the investigated composition. According to Sanderson's theory, the electronegativity (χ) of the system can be expressed as the geometric mean of electronegativity of its constituent elements [73]. According to Pauling scale, 2.55, 2.1, 1.78, and 2.33 are the

Loading [Contrib]/a11y/accessibility-menu.js

The variation of cohesive energy (*CE*) and electronegativity (χ) with increasing Pb concentration is shown in Figure 9 (Table 5). It has been recognized that *CE* and χ reduces with the increase in Pb content. The lowering in energy gap can be understood in terms of decrease in *CE*. Therefore, decrease in *CE* causes lowering in conduction band edge energy, thus lead to decrease in band gap among bonding along with antibonding orbital's. Consequently, the optical energy gap decreases [44].

3.6. Optical band gap

UV-Vis-NIR spectroscopy has been becoming an effective tool to analyze the size and optical properties of materials. The optical (transmittance and absorption) spectra recorded in optical studies (corresponds to electronic transitions) are very helpful to understand the electronic band structure and energy gap of semiconducting films. Therefore, optical characterizations give an insight into the behavior of investigated system by simple interaction with electromagnetic radiation. Moreover, optical band gap in an important parameter and plays a key role in photovoltaic cells construction.

Swanepoel has been extended the transmission method suggested by Manificier [74,75]. According to Swanepoel method, total spectrum is divided in three different spectral regions, beginning at the long wavelength end and moving to shorter wavelengths. In the transparent region of the film, absorption coefficient $\alpha \approx 0$, the transmission is determined by refractive index of investigated thin film *n* and corresponding glass substrate *s* through multiple reflections. In the weak absorption region, α is small so the transmission starts to decrease. In the region of medium absorption, α is large and hence determines the overall transmission. Optical transmission showed a strong dependence on the absorption coefficient. The absorption coefficient (α) is determined by using the relationship [23]:

(18)

$$\alpha = \frac{1}{d} \ln \frac{1}{x}$$

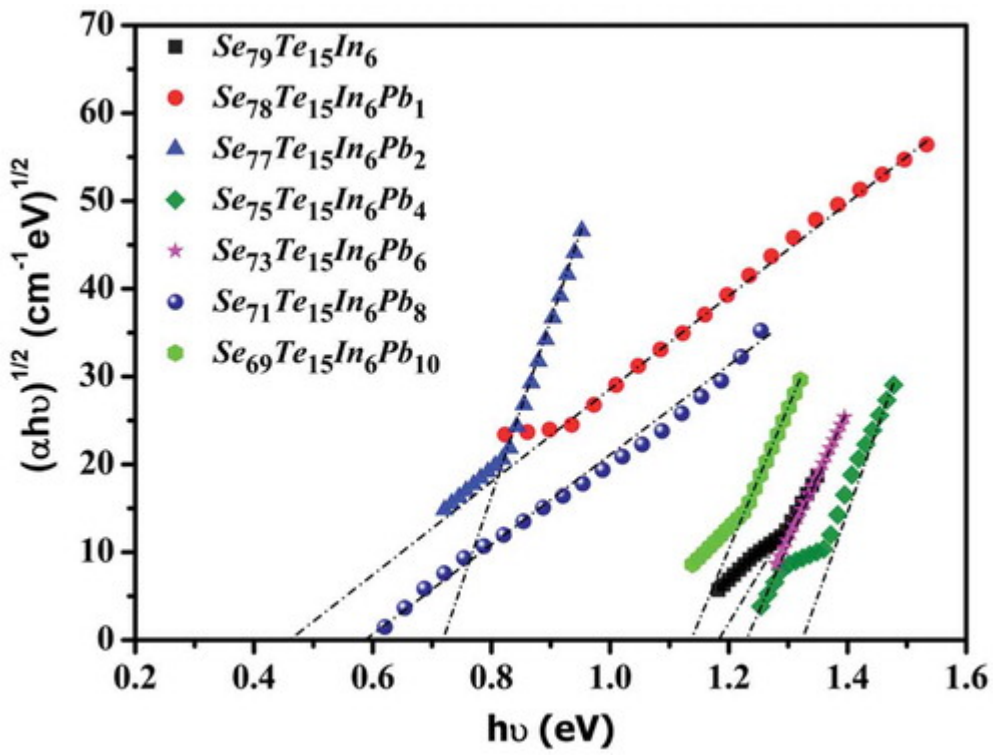
(18)

where *d* is the thickness and *x* is absorbance of thin film. The fundamental absorption, which is related with electron excitation from valance to conduction band, can be utilized to analyze the nature and value of optical band gap (E_g^{opt}). The value of E_g^{opt} has been calculated from absorption coefficient data as a function of photon energy by using the relation [24]:

(19)

$$\alpha h\nu = Bh\nu - E_g^{opt^m}$$

Loading [Contrib]/a11y/accessibility-menu.js



where B is the band tailing parameter and depends on the transition probability and m is the power that can assume values of 1/2, 3/2, ... or 2, 3, ... depending on the transition process. In the above equation, m = 2 for an indirect allowed transition, m = 3 for an indirect forbidden transition, m = 1/2 for a direct allowed transition, and m = 1/3 for a direct forbidden transition. The linearity of $(\alpha h\nu)^{1/2}$ against $h\nu$ plots (Figure 10) indicates the existence of allowed indirect transitions. Hence the value of m = 1/2 is found to be a best fit of the experimental outcomes of investigated nanochalcogenide samples corresponding to an indirect allowed transition. E_g^{opt} has been estimated by extrapolating linear part of $(\alpha h\nu)^{1/2}$ versus $h\nu$ plots (Figure 10) and intercept from abscissa (at α = 0, $E_g^{opt} = h\nu$) and calculated values are listed in Table 5 for all investigated alloys and compositional dependence is shown in Figure 2. Variation in E_g^{opt} with composition can be illustrated in terms of structural changes, density of localized states, crystallite size, and chemical disordering owing to Pb addition. It is observed that E_g^{opt} decreases for Pb ~ 1 at. wt.%, which may be attributed to increment in charged defect states and large crystalline size of sample as compare to base composition. According to Mott and Davis [23], in case of semiconducting materials, the degree of defects and disorder present in the system decide the width of localized states near the mobility edge. Such kinds of defects are produced owing to unsaturated bonds which form localized states in band gap. Inclusion of Pb content to Se-Te-In chalcogenide system may enhance the number of charged defect states due to small electronegativity of Pb as compared to Se [76]. At the same time, average crystalline size of nanocrystals of investigated composition shows a marginal increase from 17.02 to 30.59 nm (Table 1) and contributes to decrease in E_g^{opt}. A decrease in E_g^{opt} can be correlated with shifting of Fermi level due to impurity doping in investigated system [77]. Moreover upon further increment in Pb content up to 4 at. wt.%, E_g^{opt} increases with respect to Pb = 1 at. wt.%. These deduced observations may be attributed to small crystallite size of samples as well as a result of strong quantum confinement [60]. Accordance with quantum confinement, band gap becomes wider due to smaller crystallite size values, which corresponds to shifting of absorption edge to shorter wavelength region due to individual confinement of electron and holes [60]. This increase in E_g^{opt} can be explained in term of chemical bonding among Se and Pb ions. Actually with Pb addition, chalcogenide matrix becomes heavily cross linked along with deeper penetration of localized states in the energy gap, consequently steric hindrance enhanced and causes increases in

Loading [Contrib]/a11y/accessibility-menu.js

bonds with Pb-Se bonds, which have higher bond energy [6,17].

After that more inclusion of Pb favor the formation of Pb-Pb bonds by reducing Pb-Se bonds concentrations. As Pb-Pb bond have lower bond energy than Pb-Se bonds [17,23], which causes decrement in E_g^{opt} value up to 8 at. wt.% of Pb additive. Consequently, this could be explained owing to increase in crystalline size and presence of large number of defects with Pb incorporation [6,17]. Additionally at higher Pb content (10 at. wt.%), the optical band gap again increases. This again attributes to combine effect of smaller crystalline size of sample, strong confinement and decrease in density of defected states [78]. In addition, such an anomalous behavior is observed by other researchers [6, 17, 41, 46 and 78]. All these observation shows clearly an agreement with the deduced results on variation in band gap, density of defected states [41] as well as average crystalline size from XRD results with Pb content listed in Tables 1, 4, and 5, respectively.

Figure 10. Dependence of $(\alpha h\upsilon)^{1/2}$ on photon energy ($h\upsilon$) for nanocrystalline $Se_{79-x}Te_{15}In_6Pb_x$ (x = 0, 1, 2, 4, 6, 8, and 10) chalcogenide thin films.

Display full size

The obtained results on E_g^{opt} are in good agreement with the deduced value of activation energy (ΔE_σ) for nanochalcogenide $Se_{79-x}Te_{15}In_6Pb_x$ (x = 0, 1, 2, 4, 6, 8, and 10 at. wt.%) systems in our previous results [41]. As obtained values of ΔE_σ for investigated system is almost half the deduced value of E_g^{opt}, which indicates band-to-band conduction as suggested by Davis and Mott [23] in case of many amorphous semiconductors. On comparing the experimentally deduced values of optical band gap (E_g^{opt}) with theoretically estimated values of energy gap (E_g^{th}), it is concluded that they are slightly consistent with each other in case of

Loading [Contrib]/a11y/accessibility-menu.js

be understood in term of structural changes, density of localized states, crystallite size as well as chemical disordering owing to Pb addition. Effect of system bond strength and electronegativity is considered for E_g^{opt}. Whereas, the variation in density of localized states, crystallite size, structural changes, and chemical disordering may also contribute to E_g^{opt} with Pb addition in investigated Se-Te-In-Pb nanocrystalline system. As degree of defects and disorder present in the system decides the width of localized states near the mobility edge. Additionally in quantum confinement, band gap become wider due to smaller crystallite size values, which corresponds to shifting of absorption edge to shorter wavelength region due to individual confinement of electron and holes.

4. Conclusions

In this research paper, overall physical properties and submicron structural features have been analyzed for Pb-doped Se-Te-In nanochalcogenide alloys synthesized via melt-quench technique. Nanonature of synthesized samples is analyzed through XRD technique and the average crystalline size estimated from Scherrer's formula for investigated chalcogenide composition found to lie in nanorange between 12.4 and 49.38 nm. Moreover, the surface morphology as well as nanonature of examined compositions are validated by FESEM and HRTEM. The elemental composition of primed samples is analyzed through EDX analysis. EDX analysis reveals that atomic ratio of Se, Te, In, and Pb is consistent with their stoichiomatric ratio within experimental error. Consequently, structural analysis illustrates that pure Se-Te-In nanocrystals are successfully primed through mentioned technique. In theoretical predictions, influence of Pb content on examined composition has been studied with respect to their physical characterization via average coordination number (<*r*>), mean bond energy (<*E*>), cross-linking density (*X*), lone-pair electrons (*L*), fraction of floppy modes (*f*), constraints (N_c), electronegativity (χ), cohesive energy (*CE*), glass transition temperature (T_g), and heat of atomization (H_s). The mean bond energy has been derived from chemical-bond ordering model whereas CBA is utilized for calculating the cohesive energy. T_g is estimated by Tichy-Ticha and Lankhorst approaches. Addition of Pb in Se-Te-In system leads to enhanced N_c, *X*, and <*r*>. However <*E*>, *L*, *f*, χ, *CE*, T_g, and H_s are found to decrease with Pb content. This can be explained in term of replacement of stronger Se-Se bonds with weaker Pb-Se bonds with the increase in Pb content. Also, the size effect of the Pb also contributes to weaken the

Loading [Contrib]/a11y/accessibility-menu.js

theoretically estimated using Hafy-Hand and Lankford approaches are in consistent with experimental values. The band gap of investigated system has been calculated theoretically by Shimakawa's relation and deduced results are analyzed through cohesive energy, electronegativity along with average single-bond energy. A correlation is established among mean coordination number as well as several deduced physical parameters. The optical absorption phenomena in the examined system seem to be due to allowed indirect transitions with optical band gap energy (E_g^{opt}) found in the range between 0.47 and 1.27 eV.

Abstract

In view of the potential applications of immobilized enzymes, partially purified Lignin Peroxidase (LiP) from *Pseudomonas fluorescens* LiP-RL5 was immobilized on Graphene Oxide functionalized $MnFe_2O_4$ nanoparticles (10nm, synthesized by sol-gel auto-combustion) to fabricate a new hyperactive and thermostable nanobiocatalyst and thereafter characterized by using standard techniques. Immobilized LiP was quite stable at 50°C with the half-life of 14h and showed higher tolerance towards various metal ions and solvents than free LiP. Immobilized LiP retained 50% of enzyme activity even after nine consecutive runs. When tested against various textile dyes, the immobilized LiP was found quite effective with higher dye decolourization efficiency (up to 88%) within 1h of incubation at 30°C. The results of this research effort confirmed that the immobilization of LiP and fabrication of nanobiocatalyst increase the efficacy, stability, and reusability of the enzyme which could be efficiently utilized under harsh industrial conditions.

Introduction

Dyes are coloured aromatic organic compounds that contain the chromophore conjugated with the appropriate auxochrome. Chromophores are delocalized electron system with conjugated double bonds (–NO_2, –N═N–, –C═O, –C═N–, –C═C– and quinoid rings), which enable the dye molecules to absorb or reflect the electromagnetic radiations in the visible range (400–700nm), whereas auxochromes are the functional groups with one or more non-bonded pairs of electron (–OH, –SO_3H –COOH and –NH_3) which enhance the color of the dye by altering the overall energy of the electron system when combined with

the appropriate chromophore (Molinari et al., 2004). Based on the chemical structure of the chromophore group, dyes are named as indigoid, anthraquinone, triphenylmethane, azodyes, etc. The extensive use of these coloured synthetic dyes in several industrial processes such as textile, paint, paper, solar cells, sensors, etc. have polluted the water bodies as thus affects human health and aquatic life to a greater extent (Abu Talha et al., 2018). Further, the high toxicity and possible carcinogenicity of these also affect the biological cycles and ecosystem which becomes a major threat to the environment (Iark et al., 2019). Therefore, an effective and efficient strategy for the detoxification and degradation of dyes should be imperative. Many physical (coagulation-flocculation, adsorption, etc.), chemical (photocatalysis, electrochemical destruction, Fenton reagent, etc.) and biological (enzymatic degradation, bio-sorption, etc.) approaches have been proposed for the degradation of textile dyes (Darwesh et al., 2019, Lin and Peng, 1994, Sadri Moghaddam et al., 2010). The use of physico-chemical methods are restricted in the scale of operation due to their high operational cost, limited versatility, intensive energy requirement, high sludge generation, and secondary pollution problem. On the converse, biological treatment which involves the use of micro-organisms and their enzymes is most effective, cost-competitive, less energy intensive, and ecofriendly approach for the treatment of various industrial effluents containing dyes as it converts organic compounds to harmless inorganic compounds like water, ammonia, carbon dioxide, and non-toxic end products in a natural way (Abu Talha et al., 2018).

Various enzymes offer the affordable, effective, and eco-friendly options for the remediation of these toxic industrial dyes. The lignolytic extracellular enzymes (laccase (Lac), manganese peroxidase (MnP), lignin peroxidase (LiP)) secreted by various micro-organisms including white rot fungi, bacteria, and yeasts have been widely studied for this possible use in industrial dye decolourization (Cheng et al., 2007, Iark et al., 2019, Sofia et al., 2016). These enzymes show strong oxidative potential towards the degradation of highly toxic aromatic and phenolic pollutants including dyes (Wong, 2009). However, lignin peroxidase (LiP), belonging to the family of oxidoreductases, is quite different from others in terms of its H_2O_2 dependent catalytic activity towards the substrates without any other mediator (Cai and Tien, 1992). This heme-containing ligninolytic LiP requires H_2O_2 as the electron acceptor in the oxidation of aromatic rings of chromophoric dye by generating the free radicals, which are responsible for the catalytic degradation of phenolic and non-phenolic compounds (Cai and Tien, 1992, Wong, 2009). LiP has been used in many industrial activities such as food, pharmaceutical, pulp, paper, wastewater treatment, biosensors, and cosmetics (Asgher et al., 2014, Wong, 2009). Moreover, for industrial applications of the LiP enzyme, it should be able to withstand and perform under harsh environmental conditions. The use of free enzyme is limited due to low operational stability at elevated temperature, pressure, pH, presence of different organic or inorganic solvents besides other factors (Amirbandeh et al., 2017). In addition, recovery of water soluble free enzyme from the reaction blend is a challenging task which further limits its reusability (Soozanipour et al., 2015). Therefore, the enzyme is required to be fixed to a solid insoluble matrix. Immobilization of enzymes helps to reduce production cost through reusability, improved pH, high catalytic efficiency, thermal stability, and tolerance under harsh operating conditions (Ahmad and Khare, 2018, Defaei et al., 2018). Immobilized enzymes also ensure the purity and quality of final product. The immobilization methods such as physical adsorption, encapsulation, and covalent bonding have been reported for LiP immobilization (Hu et al., 2013, Qiu et al., 2009, Shaheen et al., 2017). The covalent bonding method is preferred over physical adsorption and encapsulation methods as multipoint covalent bonding between the enzyme molecules and the support enhance the stability of enzymes by forming the intermolecular bonds between enzyme molecules and support, and thus prevent the enzyme loss from the support (Bilal and Iqbal, 2019).

Besides other factors, the support matrix plays a major role in improving the efficacy and the utility of enzymes. Immobilization of enzyme molecules on the magnetic core nanoparticles like ferrites provide a mechanism for recovery of expensive catalyst from the reaction blend by applying an external magnetic field. Magnetic ferrite nanoparticles possess excellent atomic and magnetic properties, high surface to volume ratio, biocompatibility, low toxicity, good chemical stability, and ease of synthesis which help in easy biomedical and catalytic reuses (Badoei-dalfard et al., 2019, Hazra and Ghosh, 2014, Kiran, 2020, Xu and Sun, 2013). However, uncoated magnetic nanoparticles get aggregated due to the high surface to volume ratio and dipolar interactions between nanoparticles, which further limits its use for immobilization. Therefore, an appropriate functionalization is required to reduce the surface free energy in order to protect the nanoparticles from aggregation.

Graphene oxide (GO), one of the important functionalization agent, has a large surface area accompanied by numerous reactive contact sites in the form of oxygen functionalities (Wang et al., 2011). Properties such as high water solubility, good biocompatibility, porous nature, and presence of oxygen functionalities make it a most suitable nominee for surface modification of magnetic ferrite nanoparticles (Badoei-dalfard et al., 2019). Graphene oxide functionalization on magnetic nanoparticles not only inhibits aggregation and increases stability, but the presence of these hydrophilic functional groups on GO surface also create more hydrophilic surface for binding of biomolecules. Immobilization of different peroxidases (HRP, MnP, and others) on several insoluble solid matrices using different immobilization techniques has been well reported (Bilal et al., 2019, Hibi et al., 2012). However, reports are comparatively few available on extraction, purification, optimization, immobilization, and applications of LiP extracted from *Pseudomonas fluorescens (P. fluorescens)* LiP-RL5. In this present study, a new kind of matrix i.e. GO functionalized iron-based manganese ferrite ($MnFe_2O_4$) nanoparticles was used for immobilization of partially purified LiP via covalent bonding using glutaraldehyde as a crosslinker to achieve the maximum immobilization yield and improved thermostability. Different

surface energies of the matrix also play an important role in surface interactions between LiP and matrix support. Hence, for further investigation of its practical utility in various industrial applications, immobilized LiP was tested for decolourization/biodegradation of synthetic dyes besides its re-usability in order to reduce the cost and to improve the efficacy.

Strains and chemicals

Previously isolated bacterial isolate *P. fluorescens* LiP-RL5 (Rathour et al., 2020) was used for the production of lignin peroxidase. Chemicals used for various experiments were procured from S.D. Fine-Chem. Ltd., Hyderabad, India, Sigma-Aldrich Chemical Co. St Louis, USA, HIMEDIA Laboratory Ltd., Mumbai, India, and Merck Life Science Pvt. Ltd., Germany. All the reagents used were of high quality, purity, and analytical grade. All the experiments were conducted in triplicates and repeated again …

Effect of metal ions on immobilized LiP

The effect of different inhibitors (Mn^{2+}, Mg^{2+}, K^{+}, NH_4^{+}, Ca^{2+}, Fe^{3+}, Na^{+}, Hg^{2+}, Cd^{2+} and Ag^{2+}) on the catalytic mechanism of free and immobilized biocatalyst was examined by taking 1:2 ratio (v/v) of biocatalyst to selected metal ions (1 mM) and pre-incubated at 30 °C at 150 rpm for 10 min under continuous agitation. After incubation, the activity of immobilized LiP was measured at 595 nm.…

Effect of organic solvents on immobilized LiP

Ideally, enzymes need to proceed the reactions in the presence of different organic or inorganic solvents…

Production of LiP from *P. fluorescens* LiP-RL5

Bacterial isolate *P. fluorescens* LiP-RL5 was used to produce lignin peroxidase (LiP) as described earlier in Section 2.2. The enzyme assay when performed with crude enzyme, resulted in 15.2 U/mL enzyme activity. Yang et al. (2018) also used *Pseudomonas* Q18 for production of lignin peroxidase which was later used for biodegradation of lignin.…

Partial purification of LiP

Lignin peroxidase was partially purified using ammonium sulfate salting-out method followed by dialysis as described earlier in Section 2.3. The enzyme…

Conclusion

Immobilization of Lignin Peroxidase (LiP) from *P. fluorescens* LiP-RL5 on MFO@GO magnetic nanoparticles was successfully confirmed by FTIR, RAMAN, and AFM spectroscopy. Immobilized LiP exhibited higher thermal stability, reusability till nine cycles, higher tolerance towards tested metal ions and solvents in comparison to free enzyme. Immobilized LiP also exhibited great potential for textile dye biodegradation with high decolourization efficiency and better recovery, and reusability up to nine…

> ...The decline in Vmax could be probably ascribed to the large contact of laccase with the surface of Fe3O4@NaBC@GA and the interaction of functional groups results in the ABTS molecule having limited access to the laccase activity sites (Rouhani et al., 2018). Km was often used to indicate the affinity between enzymes and substrate (Isanapong et al., 2021; Kiran et al., 2020). The significant increase in the value of Km reveals that the affinity of laccase to ABTS was weakened which could be considered as that lower structural flexibility after laccase immobilization reduced mass transfer resistance (Isanapong et al., 2021)....

Abstract

Nanotechnology continuously rises due to its potential applications. To control nano-materials design and microstructure, it is very essential to understand nucleation and crystalline growth in these materials. In this research contribution, crystallization kinetics and thermal behaviour of nano-crystalline $Se_{79-x}Te_{15}In_6Pb_x$ (x = 0, 1, 2, 4, 6, 8 and 10 at. wt%) chalcogenide alloys is analyzed through differential scanning calorimetry (DSC) process under non-isothermal conditions at four different heating rates; 5, 10, 15 and 20 °C min^{-1}. The examined Se-Te-In-Pb nano-chalcogenide system is prepared through melt-quenching process. Characteristic temperatures namely glass transition temperature (T_g), onset crystallization temperature (To), peak temperature of crystallization (T_p) and melting temperature (T_m) show dependence on heating rate and composition. The various kinetic parameters such as activation energy of glass transition (E_g), activation energy of crystallization (E_c), reduced glass transition temperature (T_{rg}), Hruby number (K_{gl}), thermal stability parameters (S and H') and fragility index (F_i) are analyzed for investigated Se-Te-In-Pb nano-crystalline system. Different empirical approaches are applied to determine the apparent glass transition activation energy (E_g) and crystallization activation energy (E_c).

1. Introduction

The advancement in characterization and visualization techniques opens up a new window in materials science for control synthesis of materials at nano-level. The nanostructure configurations are progressively attracting huge attention not only for basic research point of view but for their unique properties; electronic, optical, large surface-to-volume ratio etc as compared to bulk systems [1, 2]. Nanostructure synthesis has been analyzed for several materials and interest has been developed in nano-crystalline Pb-chalcogenide semiconductors because of size tuneable properties occurring due to quantum confinement [3, 4]. They have potential applications as solar conversion devices, photo-sensors, and detectors of infrared radiation, photo resistors, photo detectors, nonlinear optical devices, thermo-electric devices, lasers, infrared emitters and solar control coatings [5–7].

A lot of research is focused on fundamental issues of these metal-containing nano-crystalline materials due to their unusual properties, including chemical durability, anomalous order of band-gaps, large dielectric constant, high carrier mobility, low phonon energy, extended IR transparency, large photo sensitivity, special nonlinear optical properties and high thermal stability [2, 8–14]. The multi-component chalcogenide nano-crystals proposed excessive assistance of having tuneable electronic, optical, defect and structural properties which facilitate photovoltaic characteristics [12]. All these fascinating, attractive and unique properties of Pb additive nano-structured semiconductors have prompted scientists to explore fundamental properties of these systems and there is a lot of scope for studying these materials in nano-range.

Chalcogenide, mostly Se-based alloys have been tremendously used in synthesis of various nano-tubes, nano-wire and nano-particles [15, 16]. Although, for technological appliances, these Se based system have limited reversibility and found to be thermally unstable [2]. Among these glasses, binary Se-Te system has gained superiority over pure amorphous Se due to their different parameters like higher crystallization temperature, higher conductivity, greater hardness, smaller ageing effect and higher sensitivity [17]. But, for practical applications these Se-Te alloys must be thermally stable with temperature and time during use. Thermal instability leads to crystallization is one of limitation of these chalcogenides systems [18]. However, addition of dopant is most efficient technique for fabricating new alloys having improved properties [19, 20]. The insertion of indium in Se-Te glassy system produces thermally stable system, thus, increases the crystallization temperature and glass transition temperature by getting cross linked structure and creating configurational and compositional disorder [21, 22]. Fundamental interest in multi-component quaternary chalcogenide alloys has been revived due to observation of quick reversible laser-induced amorphous to crystalline and crystalline to amorphous phase transitions [2]. In device fabrication, optical gap and lattice perfection plays an important role to enhance the proficiency; which depends on insertion of dopant like Pb. In certain chalcogenide systems, addition of element like Pb will cause *p* to *n* transition by limiting molecular mobility, connecting neighbouring chains and enhancing valance alteration pair (VAP) type defects [2, 17]. Pb addition to Se-based system; enhances glass forming ability, reduces aging effect and produces thermally stable system by affecting their bonding network. Pb doping prominently impacts its structural, physical, optical, electronic and thermal properties [23, 24]. All these eminent features of Pb make it attractive among the doping element in case of chalcogenide semiconductors. Our previous work on ternary Se-Te-In composition illustrates that $Se_{79}Te_{15}In_6$ has higher thermal stability among investigated alloys [18, 21]. Furthermore, our earlier analysis on dielectric and *AC* conductivity measurement in Se-Te-Pb system signifies considerable influence of Pb doping on conduction mechanism [2, 17]. Recently, intermediate phases are observed in chalcogenide glasses; which correspond to a glassy composition having an ideal stress free network and whose glass-forming tendency is optimized [25, 26].

In nano-scale devices fabrication, the synthesis of nano-structured materials by economic and simple methods becomes an importance issue. To synthesize mono-disperse, high quality, tuneable size and shape nano-crystals; it is very essential to understand the nucleation and crystalline growth in these materials [13, 14]. The crystallization kinetics of nano-chalcogenide systems plays an important role in analyzing the thermal stability, transport mechanisms, glass forming ability and thus eventually to determine the suitable range of operating temperature for a specific technological application before crystallization takes place [27].

In present research paper, the effect of Pb additive has been analyzed in term of amorphous-crystallization transformation, thermal stability, glass transition, glass forming ability of nano-chalcogenide $Se_{79-x}Te_{15}In_6Pb_x$ (x = 0, 1, 2, 4, 6, 8 and 10 at. wt%) alloys using DSC technique under non-isothermal conditions at four heating rates viz 5, 10, 15 and 20 °C min^{-1}.

2. Experimental details

Nano-chalcogenide $Se_{79-x}Te_{15}In_6Pb_x$ (x = 0, 1, 2, 4, 6, 8 and 10 at. wt%) alloys were synthesized with melt quenching process. Pure (99.999%) elements as per at.wt% are pondered with accuracy 10^{-4} g and sealed in (length ~5 cm, diameter ~12 mm) quartz ampoule under a vacuum ~2×10^{-5} mbar. Heating of sealed ampoules is done for 10 h at 3–4 °Cmin^{-1} heating rate up to 900 °C. Ampoules were frequently rocked for making melt homogenous at maximum temperature. The molten ampoule is quenched in ice cooled water. Deduced samples were grind into a fine powder

Structural characterization is performed at room temperature by taking X-ray diffraction of investigated composition. The analysis of intense characteristics peaks in X-ray pattern illustrates nano-nature of studied composition further confirmed by field emission scanning electron microscope [2, 13].

The thermal behaviour of examined composition is analyzed through temperature modulated differential scanning calorimeter (TA instrument, DSC 2910). The precision of heat flow is ±0.01 mW and precision of temperature is ±0.1 °C as deduced by microprocessor of thermal analyzer. A standard aluminium pan has been used to encapsulate a sample of around 3−5 mg at a flow of 40 ml min^{-1} under dry nitrogen atmosphere. Samples are reheated at heating rates of 5, 10, 15 and 20 °C min^{-1}. Characteristic temperatures; glass transition temperature (T_g), peak temperature of crystallization (Tp) and melting temperature (T_m) are deduced with microprocessor of thermal analyzer. In case of activation energies and other kinetic parameters, least-squares fitting technique is used to determine best fit of results.

3. Results and discussion

A typical DSC thermogram of $Se_{78}Te_{15}In_6Pb_1$ nano-chalcogenide alloy at four heating rates is given in figure 1. DSC thermogram of examined Se-Te-In-Pb nano-chalcogenide system at heating rate of 15 °C min^{-1} is given in figure 2. DSC thermogram can be resolved into three main regions. The first region characterized by first endothermic peak is glass transition region, that's arising due to rapid enhancement in specific heat of sample. The peak value of first endotherm is denoted as T_g. The second region corresponds to exothermic peak specified by crystallization process. The onset of crystallization is indicated by T_o i.e. the temperature where crystallization just starts and T_p represents peak temperature of crystallization. The third region is designated as melting temperature associated with second endothermic peak. Herein T_m corresponds to peak value of melting endotherm. It is observed that with enhancing heating rate, T_g and Tp of examined composition shift towards higher temperatures. The increase in T_g with heating rate may be attributed to relaxation dynamics in the glass transition period. T_g is the temperature at which relaxation time is equivalent to relaxation time of observation and T_g varies inversely with relaxation time [21]. Consequently when heating rate raises, T_g increase owing to reduction in relaxation time of observation. Samples primed by cooling from molten state (very high rate of cooling); associated with new degree of freedom or configuration energy states. In calorimetric analysis, samples are reheated with different heating rates, which is not similar to cooling rates during preparation. So larger is the difference, more is the structural dissimilarity among reheated solid and glass. The glassy material has 'longer' tendency to remain in glassy state if reheating rate is faster; which corresponds to a higher T_g [28]. Tp is found to shift towards higher temperature with heating rate. This can be explained as due to high heating rate system doesn't have enough time for crystallization and nucleation; which cause shifting towards higher temperature [29]. The values of T_g, T_o, Tp and T_m at all heating rates are determined for each examined alloy. The outcomes show that 1 at.wt% Pb alloy has a higher T_p. An alloy with higher Tp value has maximum operation temperature, consequently increases the archival life time [30]. Therefore, 1 at.wt% Pb system have higher value of crystallization temperature, which attributes to a single phase homogeneous morphology as confirm from DSC [30]. It is found that 10 at.wt%Pb alloy has a lower T_m value. As lower value of melting temperature reduces the RESET current and this material is advantageous in phase change random access memory (PCRAM) devices [30].

Figure 1. DSC thermograms of chalcogenide $Se_{78}Te_{15}In_6Pb_1$ glass at different heating rates.

Figure 2. DSC thermograms of the nano-chalcogenide $Se_{79-x}Te_{15}In_6Pb_x$ (x = 0, 1, 2, 4, 6, 8 and 10) multi-component alloys at 15 °C min^{-1} heating rate.

3.1. Glass transition activation energy

This site uses cookies. By continuing to use this site you agree to our use of cookies. To find out more, see our Privacy and Cookies policy.

T_g reveals information about rigidity and strength of glassy network [31]. The glass transition region has been analyzed in terms of glass transition activation energy (E_g) and variation of T_g with heating rate. Lasocka suggested empirical relation [31] which relates T_g with heating rate as given below:

where A and B are constants depending on glassy system and α signifies heating rate. A denotes glass transition temperature at 1 $Kmin^{-1}$ heating rate and within glass transition region, the time response of configurational changes with heating rate is determine by B. T_g variation with $\ln(\alpha)$ is shown in figure 3 for investigated $Se_{79-x}Te_{15}In_6Pb_x$ (x = 0, 1, 2, 4, 6, 8 and 10) nano-chalcogenide alloys. According to equation (1), plot among $\ln(\alpha)$ versus T_g should be straight line and holds true for investigated chalcogenide system. The constant A and B are deduced from intercept and slope of T_g versus $\ln(\alpha)$ plot respectively and tabulated in table 1. As cooling rate of melt is connected with constant B; so lesser is the value of B, lower is cooling rate of melt. Consequently, physical significance of B lies in configurational modification in glass transformation region [32]. As for studied nano-chalcogenide materials the values of B (given in table 1) are different; which illustrates that investigated systems undergoes different structural changes.

Figure 3. Plots of T_g versus $\ln(\alpha)$ for glassy $Se_{79-x}Te_{15}In_6Pb_x$ (x = 0, 1, 2, 4, 6, 8 and 10) nano-crystalline compositions.

Table 1. Kinetic parameters (A and B) and activation energy of the glass transition (E_g) for $Se_{79-x}Te_{15}In_6Pb_x$ (x = 0, 1, 2, 4, 6, 8 and 10 at. wt%) multi-component chalcogenide alloys.

			E_g (kJ mol^{-1})

In second approach, the apparent E_g for investigated composition has been determined using Kissinger's equation [33, 34]. As in crystallization process the activation energy is most offend determined by Kissinger equation. However it is indicated [35] that same equation can be utilized for evaluation of E_g, which is written as [32]:

where R is universal gas constant. Apparent value of E_g is calculated from slope of $\ln(\alpha/)$ with $1/T_g$ plot (figure 4). The deduced values of E_g for examined system are given in table 1. In addition, when alteration in $1/$ against $\ln(\alpha)$ is so slower as compare to alteration of $1/T_g$ versus $\ln(\alpha)$; E_g can be more simplified and estimated by Moynihan *et al* [36] formulation. Moynihan and co-workers [37, 38] use the theory of structural relaxation for evaluating E_g through heating rate dependence of T_g, which is deduced by relation:

Slope of $\ln(\alpha)$ with $1/T_g$ plot gives E_g and the calculated values of E_g are listed in table 1. For the investigated nano-systems the $\ln(\alpha)$ variation against $1000/T_g$ is shown in figure 5.

Figure 4. Plot of ln(α/) as a function of 1000/T_g for glassy $Se_{79-x}Te_{15}In_6Pb_x$ (x = 0, 1, 2, 4, 6, 8 and 10) alloys.

Figure 5. Plot of ln(α) versus 1000/T_g for various nano-crystalline $Se_{79-x}Te_{15}In_6Pb_x$ (x = 0, 1, 2, 4, 6, 8 and 10) chalcogenide glasses.

E_g depends on T_g, α and rearrangement of atoms around T_g along with molecular motion. In glassy region, E_g signifies amount of energy that required by group of atoms to jump from one metastable state to another [32]. This means E_g is responsible for rearrangement and molecular motion of atoms in region of T_g [39]. So, atom having minimum E_g value has larger probability to occupy lower internal energy metastable state, which is a most stable state. Moreover outcome shows that $Se_{73}Te_{15}In_6Pb_6$ alloy have minimum value of E_g. Consequently this composition is the most stable among the investigated alloys. It is observed that values of E_g estimated by Moynihan's relation as well as Kissinger's equation are in good agreement with each other. This indicates that in the glass transition region either of two relations can be used to calculate E_g.

3.2. Crystallization activation energy

In amorphous materials, nucleation and growth process are responsible to control amorphous-crystallization (a-c) transformation mechanism, which are illustrated through activation energy and dimensionality of growth process. In glassy alloys, DSC is best technique for quantitative analysis of crystallization kinetics. As pointed out in literature [18], the three activation energies has been involved in crystallization process: (a) nucleation activation energy, (b) growth activation energy and (c) whole crystallization process activation energy. Additionally, when activation energy for growth is deduced through thermal analysis, then it can be taken equal to activation energy for whole crystallization as mentioned in different works [15, 33, 40, 41]. The activation energy for a-c transformation (E_c) is evaluated by analyzing DSC thermograms of investigated system. E_c has been evaluated from Kissinger's equation, which gives T_p variation with heating rate (α) as below [34, 36]:

where E_c signifies activation energy of crystallization. ln(α/) plots against 1/T_p are shown in figure 6. Slope of the graph among ln(α/) with 1/T_p gives value of apparent E_c and values are listed in table 2. If (I/) variation with ln(α) is very small as compared to (1/T_p) variation; Mahadevan *et al* [40] have approximate equation (4) in the following form:

Figure 6. Plots of ln(α/) against 1000/T_p for glassy $Se_{79-x}Te_{15}In_6Pb_x$ (x = 0, 1, 2, 4, 6, 8 and 10) chalcogenide system.

Table 2. The crystallization activation energy (E_c) for glassy $Se_{79-x}Te_{15}In_6Pb_x$ (x = 0, 1, 2, 4, 6, 8 and 10 at. wt%) nano-crystalline composition deduced using different methods.

The ln(α) against $1/T_p$ plot should yield straight line as indicated in figure 7. E_c can be computed from the slope of plot and deduced values are tabulated in table 2.

Figure 7. Plots of ln(α) as a function of $1000/T_p$ for $Se_{79-x}Te_{15}In_6Pb_x$ (x = 0, 1, 2, 4, 6, 8 and 10) chalcogenide alloys.

The E_c and frequency factor (K_o) can determine through Augis and Bennett method [42]:

where K_o denotes frequency factor. Frequency factor indicates probability of molecular collision which is effective for formation of activated complex as well as description of phase transformation. Slope of this function determine through fitting of data, calculated E_c given in table 2. K_o is estimated from intercept of plot ln($\alpha/(T_p—T_o)$) versus $1/T_p$ (figure 8) and given in table 2. From the outcomes, it is analyzed that K_o is maximum for 6 at.wt% of Pb, which implies that $Se_{73}Te_{15}In_6Pb_6$ glass has maximum resistance to crystallization. Additionally, if $T_p \gg T_o$, then above equation reduces to the following relation [43]:

Plot of ln(α/T_p) with $1/T_p$ should be straight line, as revealed in figure 9. Slope of these plots provides approximated value of crystallization activation energy; listed in table 2.

Figure 8. Plots of ln($\alpha/(T_p—T_o)$ versus $1000/T_p$ for $Se_{79-x}Te_{15}In_6Pb_x$ (x = 0, 1, 2, 4, 6, 8 and 10) nano-crystalline multi-component glasses.

Figure 9. Variation of ln(α/T_p) with $1000/T_p$ for $Se_{79-x}Te_{15}In_6Pb_x$ (x = 0, 1, 2, 4, 6, 8 and 10) multi-component glassy alloys.

Thermal analysis is used to deduce E_c, which is assumed to be sum of crystal growth activation energy (E_G) and nucleation activation energy (E_N) [28]. In non-isothermal process, crystallization exotherm describes growth of crystalline phase from amorphous matrix owing to huge discrepancies in latent heats of nucleation and growth along with rapid increase in temperature. Also at temperature below crystallization exotherm nucleation calorimetrically is unobservable [28]. Therefore, in examined system deduced E_c values can be represent by E_G. E_c values obtained from above mentioned route are summarized in table 2 for the investigated samples. However, there is a slight variation in value of E_c deduced from different routes. This variation may be arising due to various assumptions taken during their formulations. On comparing E_c deduced values through different empirical routes; it is concluded that either of these formulations can be utilized to realize E_c value along with distinct precisions.

3.3. The ease of glass formation

In nano-chalcogenide materials analysis thermal stability and glass forming ability are fundamental issues, as these informations are essential to determine utility of investigating system as recording materials. Erasing and phase change optical recording processes are basically depends on laser induced thermal amorphization as well as crystallization of chalcogenide systems [32]. However thermal stability of glass is significant from technical point of view. The 'two-third' rule is excellent relationship proposed by Kauzmann [44]; which use reduced glass transition

This site uses cookies. By continuing to use this site you agree to our use of cookies. To find out more, see our Privacy and Cookies policy.

temperature (T_{rg}) to determine glass forming ability (i.e. $T_{rg} \geq 2/3$). T_{rg} provide information regarding ease of glass formation as [44]:

At all heating rates, '2/3' rule fits good for studied nano-chalcogenide materials (table 3). The deduced T_{rg} values are in 2/3order, demonstrating that glass forming ability (*GFA*) of each investigated nano-material is high.

Table 3. Values of parameters T_{rg} and $(T_p - T_g)$ for various nano-crystalline $Se_{79-x}Te_{15}In_6Pb_x$ (x = 0, 1, 2, 4, 6, 8 and 10 at. wt%) chalcogenid glasses at 5, 10, 15 and 20 °C min^{-1} heating rates.

The distortion in local atomic configuration in amorphous chalcogenides causes changes in various kinds of photo-induced structural or photo-chemical and memory switching properties. Hence in these materials such structural transformation come from boundaries where glasses are stable; and have tendency to crystallize when heated or cooled slowly [27]. So in memory and switching materials, it is important to mention thermal stability and GFA. When physical conditions rapidly varies due to heating effect, thermal stability is an important parameter [27]. For example, In optical recording situation; amorphous state at low temperature as well as having small crystallization time. This reveals that a phenomenon of phase transformation occurring rapidly in these glassy alloys [27, 45]. Additionally, the difference among T_p and T_g indicates thermal stability as well as *GFA* of glass against crystallization. As higher values of (T_p—T_g) correspond to higher thermal stability and *GFA*; signify a delay in nucleation procedure and kinetic resistance to crystallization. However smaller value of (T_m—T_p) reveals retardation in growth procedure [32, 39]. The deduced (T_p—T_g) values for all nano-crystalline system at various heating rates are tabulated in table 3. In Se-Te-In-Pb nano-chalcogenide system it is fascinating to observed that the (T_p—T_g) values are maximum for Pb = 1 at. wt%. This means that glass with 1 at. wt% of Pb is thermally more stable, lesser tendency to crystallization and maximum GFA in studied system. Also Hruby [46] has given a parameter K_{gl} to determine the *GFA* which is given as:

By this relation, Hruby correlate nucleation with growth aspect of phase transformation. For investigated compositions K_{gl} values at various heating rates are calculated (listed in table 4). It is stated that for $K_{gl} \leq 0.1$, a good glass forming ability has not been obtained [47]. It is clearly observed from table 4 that $K_{gl} > 0.1$, for investigated chalcogenide system; indicates good glass forming ability.

Saad and Poulain [48] have described two parameters for determining thermal stability of system, which is expressed by the following relations [32]:

Thermal stability parameter illustrates resistance to devitrification after glass formation. In equation (11) rate of devitrification transformation is related to term (T_p—T_o). The H' and S parameters are deduced (table 4). It is detected from table 4 that 1 at. wt% of Pb have highest values of H' and S; which demonstrates that nano-crystalline $Se_{78}Te_{15}In_6Pb_1$ alloy is thermally more stable than other alloys of this series. Moreover for Pb additive Se-Te-In nano-system dependence of thermal stability parameters (T_{rg}, K_{gl}, H' and S) on heating rates are shown in figure 10, which depends on characteristic temperatures (T_g, T_o, T_p and T_m). Figure 10 shows a linear dependence of T_{rg}, K_{gl}, H' and S on ln(α), which reveals enhancement in thermal stability with heating rates.

Figure 10. Dependence of thermal stability parameters (T_{rg}, K_{gl}, H' and S)) on lnα for $Se_{79-x}Te_{15}In_6Pb_x$ (x = 0, 1, 2, 4, 6, 8 and 10) glassy alloys.

The empirical parameters which are evaluated above have been mostly use for quantitative characterization of glass formation. As there is no standard criteria for parameterize glass formation. For measuring *GFA* of glassy system, fragility index (F_i) is a significant parameter. F_i signify rate through which relaxation time reduces with temperature raising around T_g. F_i is calculated through the following relationship [49, 50]:

It is stated by Viglis that [51] glass-forming liquids that's reveal approximate dependence on Arrhenius temperature are characterized as strong glass-forming liquids. These liquids have low value of F_i ($F_i \approx 16$), where as high value of F_i ($F_i \approx 200$) signifies limit of fragile glass forming liquid [21]. Consequently in categorization of glass-formation upon viscosities [28], it concludes that strong glass-forming liquids reveal an Arrhenius temperature dependence on viscosity. Whereas fragile glass-forming liquids show non-Arrhenius behavior. For examined compositions at various heating rates, F_i is calculated by using value of E_g deduced from Kissinger's formula and Moynihan approximation and are listed in table 5. As all F_i values are within above-mention limit, so investigated nano $Se_{79-x}Te_{15}In_6Pb_x$ (x = 0, 1, 2, 4, 6, 8 and 10) chalcogenide system are primed from strong glass-forming liquid. However, F_i decreases with heating rate and this can be explained through increase in T_g with heating rate.

Table 5. Fragility index (F) for glassy $Se_{79-x}Te_{15}In_6Pb_x$ (x = 0, 1, 2, 4, 6, 8 and 10 at. wt%) nano-crystalline composition at 5, 10, 15 and 20 °C min^{-1} heating rates.

4. Conclusions

In present research paper, the crystallization kinetics analysis has been performed for Pb additive Se-Te-In nano-chalcogenide system through DSC under non-isothermal conditions at four heating rates 5, 10, 15 and 20 °Cmin^{-1}. The examined nano-chalcogenide system is prepared via melt-quench process. The kinetic parameters, namely activation energy for glass transition (E_g), activation energy for crystallization (E_c), reduced glass transition temperature (T_{rg}), Hruby's parameter (K_{gl}), thermal stability parameters (S and H') and fragility index (F_i) are deduced from heating rate dependence of T_p and T_g. It is analyzed that value of E_g calculated from Moynihan's as well as Kissinger's approaches are consistent. The outcome shows that nano-crystalline $Se_{78}Te_{15}In_6Pb_1$ alloy has a higher T_p value among the examined system; which indicates that this composition has maximum operation temperature, archival life time and attributes to a single phase homogeneous morphology. Also it is observed that 10 at. wt% Pb alloy has a lower T_m value; which reduces the RESET current and may be useful in memory device. Additionally, the values of E_c deduced by different approach are in good agreement with each other. The K_o is maximum for 6 at. wt% of Pb, which indicates that $Se_{73}Te_{15}In_6Pb_6$ nano-crystalline system have maximum resistance to crystallization. Moreover 2/3 rule holds good for nano-crystalline Se-Te-In-Pb chalcogenide system; signifies good glass forming ability of investigated systems. Also (T_p—T_g) is maximum for Pb = 1 at. wt% ; illustrating maximum thermal stability in analyzed compositions. K_{gl}, S and H' are also maximum for 1 at. wt% of Pb. Consequently, the deduced result shows that nano-crystalline $Se_{78}Te_{15}In_6Pb_1$ system has better glass-forming ability than other composition under examination. Moreover the value of F_i indicates that investigated system is obtained from strong glass forming liquids.

Abstract

In this paper, silver-doped zinc oxide nanoparticles were synthesized by using a solution combustion technique, in which zinc nitrate is used as an oxidizer and tartaric acid as a fuel. The phase composition, morphology and structural properties of the as-synthesized zinc oxide and silver-doped zinc oxide were established by using powdered X-ray diffraction, field emission scanning electron microscopy coupled with energy-dispersive X-ray spectroscopy, and X-ray photoelectron spectroscopy studies. Due to well-defined morphologies and crystallinity, the pure zinc oxide and silver-doped zinc oxide nanostructures can be used as efficient chemical sensors for the detection of p-nitrophenol (PNP). ZnO was found to show a low value of the limit of detection (LOD), i.e., 2.175 μM/L, for p-nitrophenol sensing; moreover, a sharp decrease in the limit of detection was observed with an increase in the concentration of silver ions, and the LOD value decreased to 0.669 μM/L for 10 mol % silver-doped zinc oxide. It is therefore concluded that Ag-doped ZnO shows a lower limit of detection as compared to pure ZnO for p-nitrophenol sensing.

1. Introduction

Rapid industrialization and various anthropogenic activities have led to the discharge of various types of toxic chemicals, which contaminate the environment and adversely affect the ecosystem. Among various toxic chemicals, the nitrophenols and organic dyes are the most emerging environmental pollutants. In particular, p-nitrophenol (PNP) is commercially very useful and finds application in various fields such as use as an intermediate in the synthesis of paracetamol and an important base material for the synthesis of commonly used pesticides such as acetophenetidine; it also plays an important role in the leather industry, etc. [**1**,**2**,**3**]. The release of PNP into the environment takes place through a number of ways, such as release as a side product of many pharmaceutical industries, the disintegration of other pesticides and the transformation of phenol into nitrophenol molecules. PNP is very stable in the environment under normal conditions and is a highly toxic chemical that leads to bioaccumulation as well as cytotoxic/carcinogenic effects on living organisms [**4**,**5**]; due to all these reasons, the United States Environmental Protection Agency (USEPA) has considered PNP as a priority contaminant [**6**]. PNP is considered as the root cause of different problems such as irritation and inflammation in the eyes and nose, respiratory tract disorders, cardiac disorders, hematological problems, digestive problems, musculoskeletal issues, renal disease, and dermal/ocular problems in living organisms. It easily reacts with blood and leads to the formation of methemoglobin, which is mainly responsible for cyanosis, confusion and unconsciousness [**5**,**7**]. Different environmental organizations such as the Brazilian Environmental Council, USEPA and European Commission have declared 100, 60 and 0.1 ppb of PNP as maximum permitted limits [**5**,**7**], respectively. Therefore, the detection of PNP at trace levels is required.

Hence, it is the need of the hour to design a highly reliable and robust chemical sensor for the rapid detection of PNP. Several methods are reported in the literature for the effective and selective determination of PNP such as gas chromatography, high-

Typesetting math: 100%

performance liquid chromatography (HPLC), spectrophotometry, fluorescence, electrophoresis/capillary electrophoresis etc. [**8**,**9**,**10**,**11**,**12**]. However, expensive columns and a lot of reagents are required in HPLC and electrophoresis, aqueous samples cannot be used directly in gas chromatography, and interference is a major problem in spectrophotometric and fluorometric methods. In other words, all these techniques are either very expensive or time consuming or suffer from some other problems. Therefore, there is a need to develop a simple, cost-effective and quick technique that can effectively monitor the presence of PNP in a sample. Recently, several attempts have been made to synthesize a PNP sensor using various metal oxide nanomaterials such as copper oxide nanoparticles [**13**], a reduced graphene oxide/Au nanoparticle composite [**14**], a gold–ZnO–SiO_2 nanostructure [**15**], a CeO_2/ZnO nano-composite [**16**], Ag doped Nd_2O_3 nanoparticles [**17**] and CeO_2–ZnO nanoellipsoids [**18**].

Among the various transition metal oxides, zinc oxide is a very versatile, multifunctional semiconductor with a direct band gap of 3.37 eV. Zinc oxide is preferred over other metal oxide nanomaterials because it has a high exciton binding energy (60 meV), high catalytic efficiency, high-electron communication property, and cost-effective environmental sustainability [**19**,**20**,**21**,**22**,**23**,**24**]. Moreover, it has been observed that we can alter the properties of ZnO nanostructures for desired applications by manipulating the shape, grain size and morphology. However, the doping of ZnO nanostructures with transition metals, such as Mn, Ga, Fe, In, Co, Mg, Al, Sb, Sn, Ag, etc., has been found to deliver better control over the band gap [**24**,**25**,**26**]. Among the various transition metals, Ag ions have become the interest of many research groups [**27**,**28**], because of their suitable band gap, as they reduces the electron hole recombination and hence result in improvement in the photocatalytic properties, as well as proving to be an effective sensor material for toxic chemicals [**29**].

In this paper, we report the solution combustion synthesis of silver-doped zinc oxide nanostructures, $Ag_xZn_{1-x}O$ (x = 0, 0.01, 0.05 and 0.10). The solution combustion synthesis route was utilized in the present paper for the production of nanostructure materials in a single step, a time- and energy-saving process [**30**,**31**,**32**]. As-synthesized $Ag_xZn_{1-x}O$ nanostructures were utilized for the formation of a highly sensitive luminescence sensor for the detection of PNP in an aqueous medium. The limit of detection (LOD) for PNP was calculated for ZnO as well as Ag-doped ZnO samples, by using the Stern–Volmer equation.

2. Experimental

2.1. Materials

Zinc nitrate hexahydrate ($Zn(NO_3)_2{\cdot}6H_2O$), tartaric acid ($C_4H_6O_6$), silver nitrate ($AgNO_3$) and p-nitrophenol ($C_6H_5NO_3$) (PNP) were all of analytical grade and obtained from Merck, Germany and these chemicals were directly used as received without further purification. Deionized (DI) water obtained from a Millipore Elix system was used for all the experiments.

2.2. Synthesis of ZnO Nanoparticles

Pure ZnO nanostructures were synthesized from zinc nitrate hexahydrate (oxidizer) and tartaric acid (fuel) using a typical reaction procedure of solution combustion by optimizing the stoichiometric ratio (ϕ = 1). In the synthesis process, 4.0 g of $Zn(NO_3)_2{\cdot}6H_2O$ and 2.0 g of $C_4H_6O_6$ were dissolved in 50 mL of deionized water, separately. Then, the tartaric acid solution was added drop-wise to the $Zn(NO_3)_2{\cdot}6H_2O$ solution with continuous stirring at room temperature. The resultant solution was thoroughly stirred at room temperature for 30 min, and the resulting solution was heated till the evaporation of the excess water content to obtain the gel-like materials. The resulting gel-like material was transferred into a muffle furnace in a silicate crucible at 500 °C for 1 h. In the muffle furnace, tartaric acid (fuel) and zinc nitrate hexahydrate (oxidizer) were combusted for the formation of the crystalline ZnO nanostructures, at high temperature. The synthesized nanostructures were further washed with distilled water followed by ethanol, and finally, the precipitates were dried in an oven at 60 °C.

2.3. Synthesis of Ag-Doped ZnO Nanostructures

The same procedure was adopted for the synthesis of Ag-doped ZnO by taking an appropriate amount of $AgNO_3$. For the synthesis of 1%, 5% and 10% Ag-doped ZnO, 0.022, 0.114 and 0.228 g of $AgNO_3$ dissolved in 50 mL of water was added, respectively; after that, the same procedure was adopted as in **Section 2.2**.

2.4. Characterization

The synthesis of the nanostructures was confirmed by characterizing them for their morphological, structural and optical properties. The morphological investigation was carried out by using field emission scanning electron microscopy (SEM) with a FEI Quanta 200 FEG (Pittsburgh, PA, USA) with the energy dispersive X-ray spectrometer Bruker XFlash 4030 (EDS), while the structural characterization was performed using X-ray diffractometer (D8 Discover, Bruker AXS, Karlsruhe, Germany). The optical properties of the as-synthesized nanostructures were examined at room temperature by using UV–visible spectroscopy (AvaSpec-2048). The XPS study of the ZnO powder and Ag-doped ZnO powder was carried out by employing X-ray energy dispersion spectrometer (Bruker XFlash 4030, Karlsruhe, Germany). The sensing properties of the pure ZnO and Ag-doped ZnO nanostructures were recorded using room-temperature photoluminescence spectra (Perkin Elmer-LS55 fluorescence spectrophotometer, Waltham, MA, USA).

2.5. Luminescent Sensor Evaluation of ZnO and Ag-ZnO Nanoparticles

The Perkin Elmer LS55 fluorescence spectrophotometer was used at room temperature to determine the sensing properties of the pure ZnO and Ag-ZnO nanostructure. In this investigation, the pure ZnO and Ag-ZnO nanostructures were utilized to fabricate the luminescent sensor interface for the sensing of PNP. The obtained ZnO and Ag-ZnO nanostructures were dispersed in DI water (1.5 mg

Typesetting math: 100%

in 50 mL of H_2O), and a 5 mM stock solution of PNP was also prepared for the entire experiment. All the solutions were prepared 30 min before performing the experiments. The sensing experiments were performed at different concentrations of PNP in the range of 0.833–9.980 µM.

3. Results and Discussion

3.1. FESEM of $Ag_xZn_{1-x}O$ Nanostructure

The surface morphology and variation in the particle size were studied by using high-resolution FESEM. Typical low and high magnification FESEM images of the pure ZnO, 1% Ag-ZnO, 5% Ag-ZnO and 10% Ag-ZnO nanostructures are shown in **Figure 1**a–h. A careful observation of **Figure 1** reveals that the as-synthesized nanostructures were uniformly grown at very high density. It was also observed that the structure of ZnO did not show any deviation with the doping of silver ions and remained uniform even at a high concentration of silver ions (10% Ag ions).

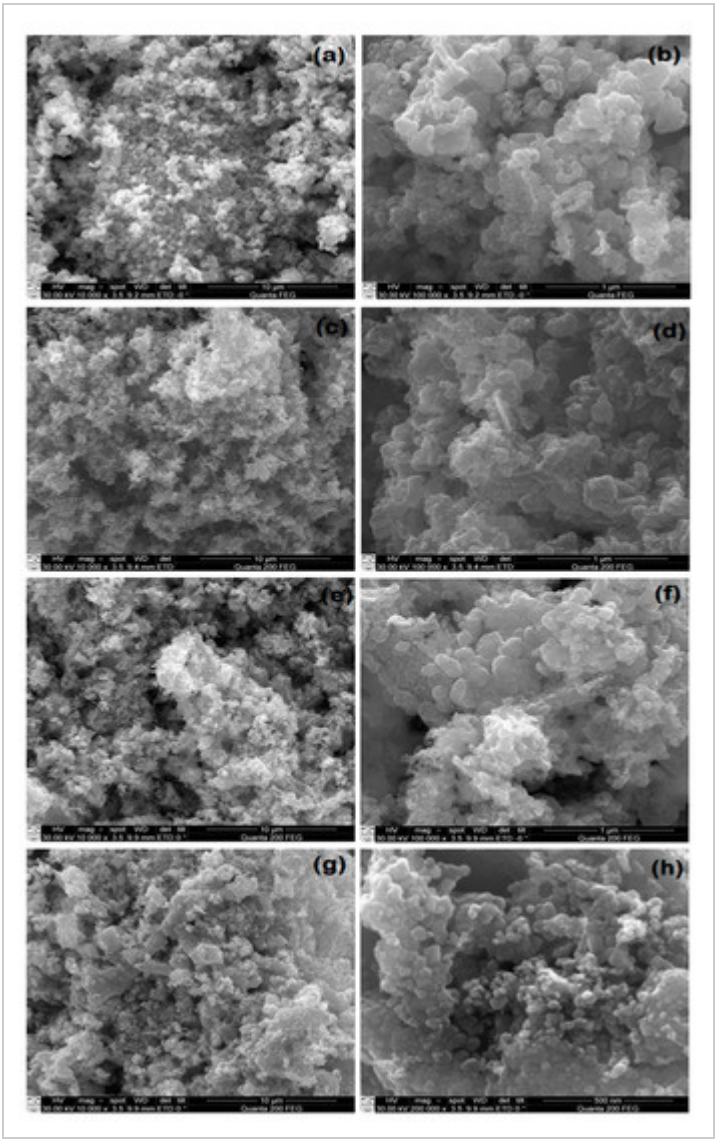

Figure 1. Low and high-magnification FESEM micrographs of pure ZnO (**a**,**b**) and 1% (**c**,**d**), 5% (**e**,**f**) and 10% (**g**,**h**) Ag-doped ZnO nanostructures.

3.2. PXRD

Figure 2a represents the XRD spectra of the pure ZnO and Ag-ZnO nanostructures, which were recorded in the range of 20–80°. The XRD spectra show that pure ZnO has characteristic diffraction peaks attributed to the crystalline nature of ZnO. A clear peak of silver ions was also observed for the Ag-ZnO composite, confirming the doping of Ag into ZnO. The intensity of the peak also revealed that there is a slight intensity increase with an increasing concentration of silver ions.

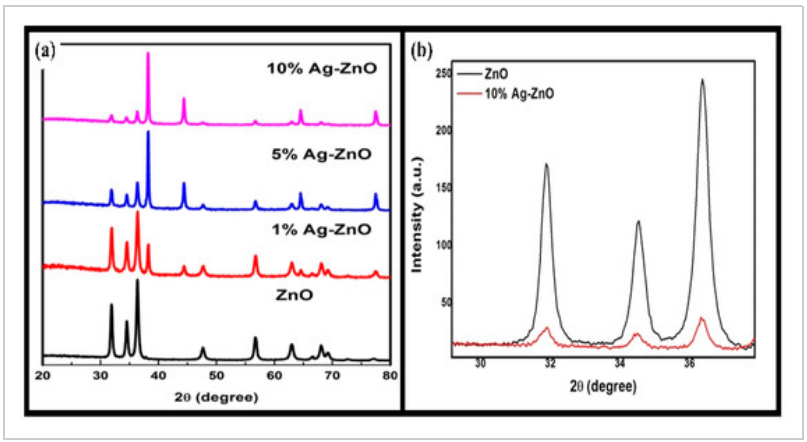

Figure 2. (**a**) XRD pattern of $Ag_xZn_{1-x}O$ nanostructure and (**b**) comparison of (100), (002) and (101) peaks from the XRD pattern of pure ZnO and 10% Ag-ZnO nanostructures.

The data were found to be in reasonable agreement with the Joint Committee on Powder Diffraction Standards (JCPDS) card for ZnO (JCPDS 036-1451) [**33**]. In **Figure 2**a, the strongest dhkl values resemble the 2θ values of 31.74°, 34.42°, 36.26°, 47.66°, 56.70°,

Typesetting math: 100%

63.07°, 66.42°, 67.92°, 69.10°, 72.45° and 77.31° for (100), (002), (101), (102), (110), (103), (200), (112), (201), (004) and (202), respectively, which confirms the presence of the wurtzite hexagonal phase of ZnO. However, in the silver-doped zinc oxide sample, in addition to the ZnO reflections, the characteristic peaks (111), (200) and (220) corresponding to Ag ions appeared at 2θ of 38.29°, 44.28° and 62.93°, respectively. From **Figure 2**a, it can be observed that as the concentration of Ag increases, the intensity of the Ag ion peaks becomes more predominant. The XRD spectra clearly indicate that only ZnO and Ag ions are present; no other peak is found corresponding to any other impurity atom such as Zn and Ag_2O. This simply reveals that the as-synthesized nanostructures are crystalline and pure up to the detection limit of XRD.

Furthermore, a close comparison of the peaks (100), (002) and (101) is shown in **Figure 2**b, which clearly reveals that up to the studied concentration of silver ions (10% Ag), no deformation in the structure is observed. The crystallite size was calculated using the XRD peak with the Debye–Scherrer formula, which is given as:

$$D = \frac{k\lambda}{\beta Cos\,\theta} \quad (1)$$

where *k* is the structural constant, *λ* is the wavelength of the X-ray, *D* is the size of the nanoparticle and *β* is the full width at half maximum. Using Equation (1), the crystallite particle sizes were determined to be 39, 32, 26 and 21 nm, respectively, for the pure ZnO and 1%, 5% and 10% Ag-doped ZnO nanostructures.

3.3. EDS

The composition and purity of the as-synthesized ZnO and Ag-ZnO nanostructures were investigated by using EDS. The EDS data are provided as **supplementary data (Figures S1–S4)**, which confirmed that the nanoparticles were made of zinc, oxygen and silver atoms only.

3.4. UV–Visible

The optical properties of the $Ag_xZn_{1-x}O$ (x = 0, 0.01, 0.05 and 0.10) nanostructures were studied by using UV–visible (UV–Vis) spectroscopy. The results indicate that the maximum absorption peaks are at 375, 379, 382 and 385 nm (**Figure 3**) for the pure ZnO, 1% Ag-ZnO, 5% Ag-ZnO and 10% Ag-ZnO nanostructures, respectively, corresponding to wurtzite hexagonal phase bulk ZnO [**29**]. The red shift due to the presence of Ag ions observed in the absorption maxima is attributed to the decrease in the band gap energy with an increase in the concentration of Ag ions. No other absorption peak was detected corresponding to impurities, which confirms that the synthesized Ag/ZnO nanostructures possess good optical properties.

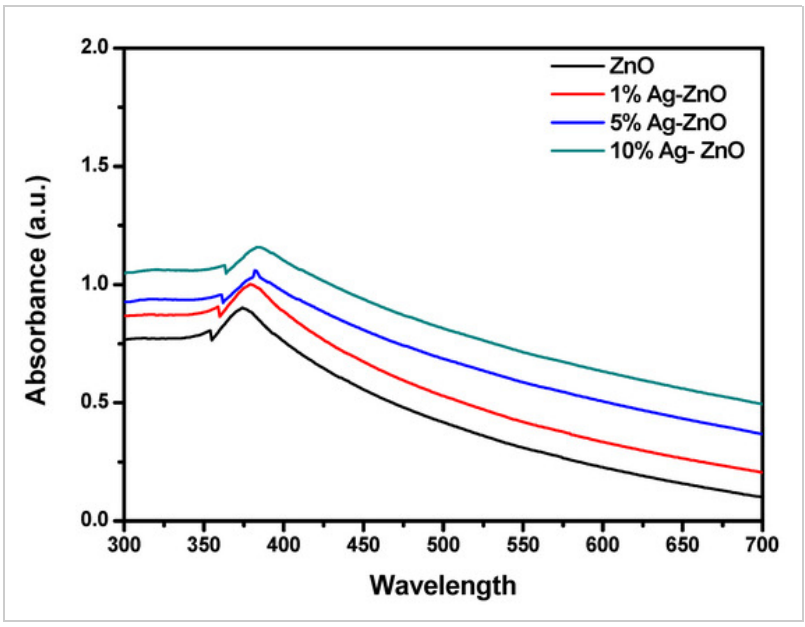

Figure 3. UV–Vis spectrum of pure ZnO, 1% Ag-ZnO, 5% Ag-ZnO and 10% Ag-ZnO nanostructures.

3.5. XPS

The XPS survey spectra for the ZnO and Ag-doped ZnO samples are presented in **Figure 4**. From the spectra, one can see that the main elements on the surface of the samples are zinc, oxygen, carbon and silver. It can be noted that the silver Ag 3d peak appears only for the Ag-doped ZnO samples. A low-intensity carbon C 1s peak at 285 eV is present, most likely due to atmospheric contaminants adsorbed on the surface of the sample. High-resolution spectra were acquired in the O 1s, Zn 2p and Ag 3d regions for obtaining the atomic concentrations (**Table 1**) and possible chemical bond identification. The data in **Table 1** were determined by calculating the appropriate peak area after Shirley background subtraction. The zinc high-resolution XPS spectra in the Zn 2p region (**Figure 5**) for the ZnO and Ag-doped ZnO samples show two peaks due to spin-orbit splitting: Zn $2p_{3/2}$ and Zn $2p_{1/2}$. The position of the Zn $2p_{3/2}$ peak at approximately 1021.7 eV is assigned to the ZnO bond since it is in good agreement with the known peak values and shape for ZnO (1021.7 eV) [**34**,**35**].

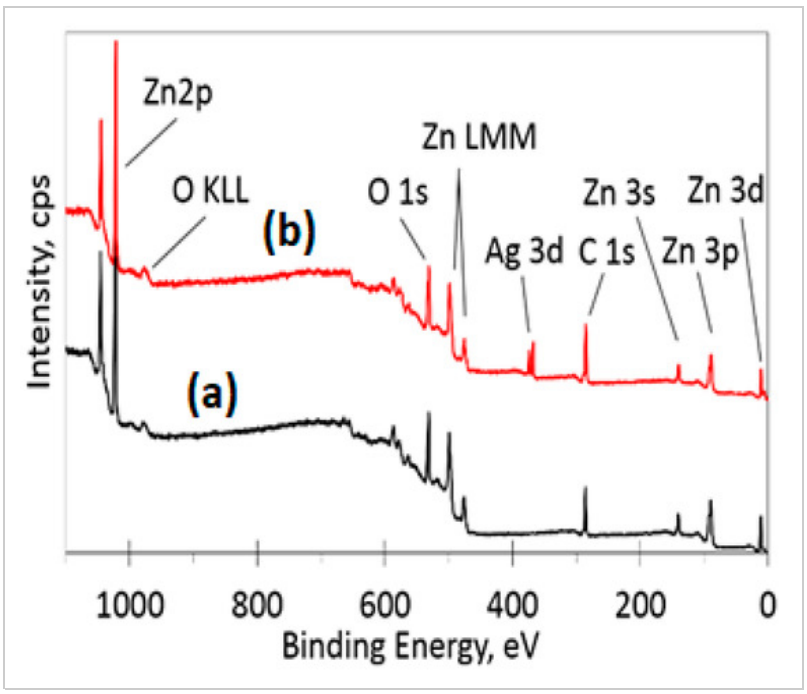

Figure 4. XPS survey spectra of (**a**) ZnO and (**b**) 10% Ag-ZnO powder samples.

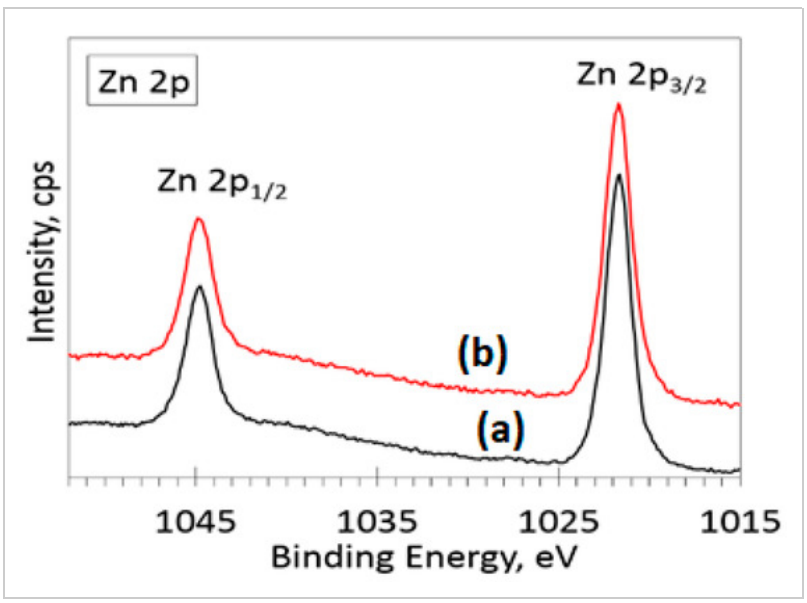

Figure 5. High-resolution XPS spectra in Zn 2p region for (**a**) ZnO and (**b**) 10% Ag-ZnO powder samples.

Table 1. Atomic concentrations calculated from the XPS measurements.

The deconvolution of the O 1s spectra (**Figure 6**b) showed a negligible shift (less than 0.1 eV) of the main peak (ZnO) position (530.4 eV) due to the incorporation of 10% Ag. The main difference between the two spectra is in the left side of the spectra. Namely, the peaks at 531.8 eV (oxygen-deficient regions within the matrix of ZnO, green curve) and 532.5 eV (C-O bonds and chemisorbed atmospheric oxygen species, blue curve) are more intense for the 10% Ag sample. This variation of intensity could arise due to different amounts of adsorbed atmospheric contaminants on the sample surface. The highest binding energy peak at 532.5 eV is usually assigned to C-O bonds and chemisorbed atmospheric oxygen species [**34**,**35**,**36**]. Both peaks (531.8 and 532.5 eV) are more intense for the 10% Ag-doped sample (**Figure 6**b). This increase in intensity could arise due to different amounts of adsorbed atmospheric contaminants on the sample surface. The lower intensity peak positioned at 531.8 eV corresponds to the known values of binding energy for O^{2-} ions in oxygen-deficient regions within the matrix of ZnO [**37**] or O-C=O/C=O species bonds from adsorbed atmospheric contaminants [**38**]. In the Ag 3d spectra (**Figure 7**), two peaks were detected, fitted using a sum of Lorentzian–Gaussian (80:20) functions, with an asymmetric peak shape at positions 386.2 and 374.2 eV on the binding energy scale. The deconvoluted Ag 3d spectra for the 1% Ag-ZnO powder sample is shown in the **supplementary data (Figure S5)**. These peak positions are in good agreement with the well-known spin-orbit split energy values [**39**] of Ag $3d_{5/2}$ and Ag $3d_{3/2}$ doublet peaks for Ag^0. The position and shape of these peaks indicate the presence of metallic silver in Ag-doped ZnO powder samples.

3.6. Ag-ZnO Nanoparticles as Fluorescent Sensor for p-Nitrophenol

The stability of the synthesized Ag-doped ZnO nanostructures was studied by using a fluorescence spectrophotometer, and there was no change in the intensity and position of the peak, even after a time of 15 days. The reproducibility values of the fluorescence measurements were estimated to be ±0.1%. The as-synthesized $Ag_xZn_{1-x}O$ (x = 0, 0.01, 0.05 and 0.10) samples were studied for the fluorescence sensing of p-nitrophenol (PNP). Before conducting the sensing experiments, photoluminescence (PL) spectra of pure ZnO and Ag-doped ZnO nanostructures were recorded at various excitation wavelengths in the range 330–410 nm with a regular gap of 10 nm in order to find out the excitation maxima for the nanostructures. In the PNP concentration-dependent studies, the concentration of PNP was changed gradually, while the concentrations of the nanostructures were kept constant (1.5 mg in 50 mL). The response of the PL quenching for ZnO and Ag-doped ZnO is illustrated in **Figure 8**.

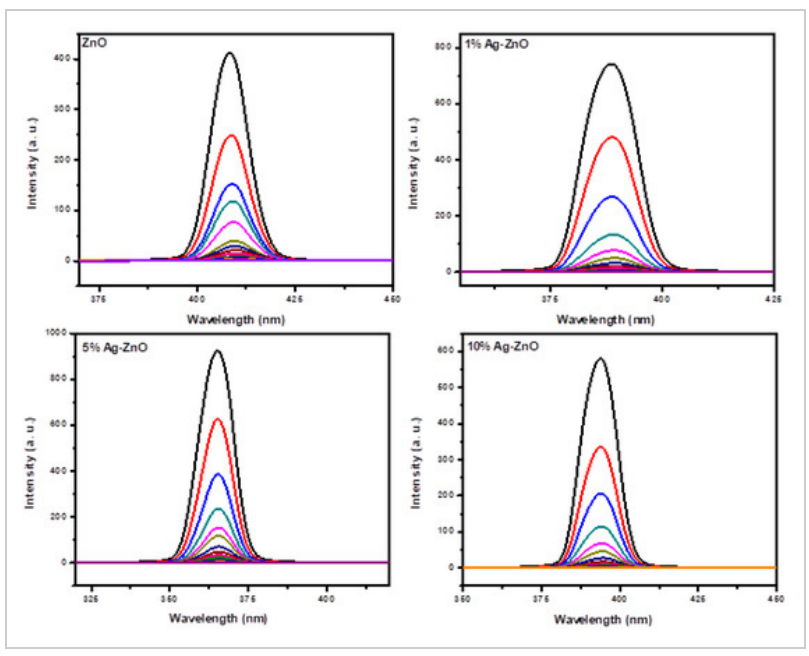

Figure 8. It was observed that the photoluminescence (PL) intensity of the pure ZnO and Ag-doped ZnO nanostructures decreases with an increase in the concentration of p-nitrophenol (PNP), which clearly indicates the binding of PNP to the surface of nanostructures.

The Stern and Volmer equation [**40**] initially deal with the kinetics analysis of fluorescence quenching, which has promising

Typesetting math: 100%

applications for investigating bimolecular interactions in the electronic excited state. The analysis of the fluorescence quenching processes was performed by using the Stern–Volmer equation [**40**]:

$$\frac{I_o}{I} = K_{sv}[Q] + 1 \quad (2)$$

where I_o is the intensity before and after the addition of PNP, while I correspond to the intensity after the addition of PNP. K_{sv} and [Q] are the Stern–Volmer quenching constant and the concentration of the quencher, respectively. **Figure 9** shows the variation of $(I_o/I)-1$ vs. the concentration of the PNP quencher. In pure ZnO as well as Ag-doped ZnO, it was observed that the Stern–Volmer plots show exponential behavior (linear as well as non-linear) over the entire concentration range of PNP studied. Linear behavior was observed upon increasing the concentration up to a certain level, implying the dominance of the static quenching over the dynamic quenching process; however, a further increase in concentration resulted in an exponential increase, which suggests that there exist both types of quenching, i.e., a combination of static and dynamic quenching by the same quencher [**40**].

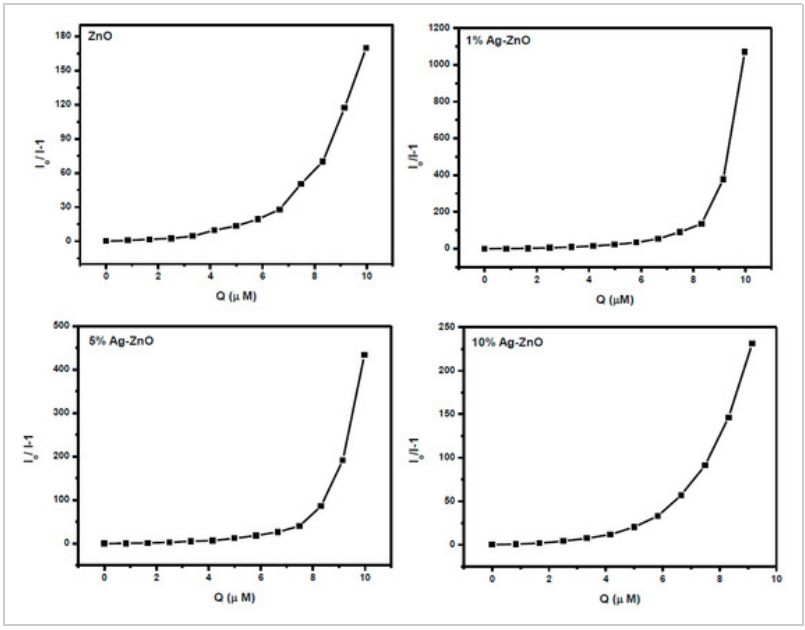

Figure 9. Stern–Volmer plots of $Ag_xZn_{1-x}O$ nanostructure with increasing concentration of p-nitrophenol.

To resolve this ambiguity, on account of the non-linear response of the intensity ratio to the concentration of the analyte, a modified Stern–Volmer equation has been suggested [**37**,**41**]:

$$\frac{I_o}{I} = K_{sv}[Q]e^{V[Q]} + 1 \quad (3)$$

Equation (3) can further be simplified as follows:

$$\frac{I_o - I}{Ie^{V[Q]}} = K_{sv}[Q] \quad (4)$$

where V is the static quenching constant and is obtained from Equation (4) by plotting $\frac{I_o-I}{Ie^{V[Q]}}$ vs. [Q] and by varying V till a linear response is obtained as shown in Figure.

Figure 10a–d show a linear fit of the plot $\frac{I_o-I}{Ie^{V[Q]}}$ versus PNP concentration, with regression coefficients of 0.952, 0.963, 0.975 and 0.994 for the pure ZnO and 1%, 5% and 10% Ag-doped ZnO nanostructures, respectively. The value of V fits to 0.31 with a K_{SV} of 7.33 × 10^5 M^{-1} in the case of pure ZnO, while V fits to 0.30, 0.25 and 0.42 with K_{SV} of 1.31 × 10^6, 8.093 × 10^5 and 5.24 × 10^5 M^{-1} for the 1%, 5% and 10% Ag-doped ZnO nanostructures, respectively. The limits of detection (LODs), calculated following the 3σ IUPAC criteria, were found to be 2.17, 1.60, 1.18 and 0.66 μM for the pure ZnO and 1%, 5% and 10% Ag-doped ZnO nanostructures, respectively, which clearly indicates that the presence of Ag improved the LOD for a luminescent sensor for PNP. The sensing mechanism has been shown in **Scheme 1**. The PL quenching of Ag-doped ZnO can be attributed to the analytes binding on the surface of nanostructure, which traps the excited electron-by-electron transfer mechanism [**42**]. The LOD for PNP calculated for various samples of ZnO as well as Ag-doped ZnO is also compared with the literature (**Table 2**).

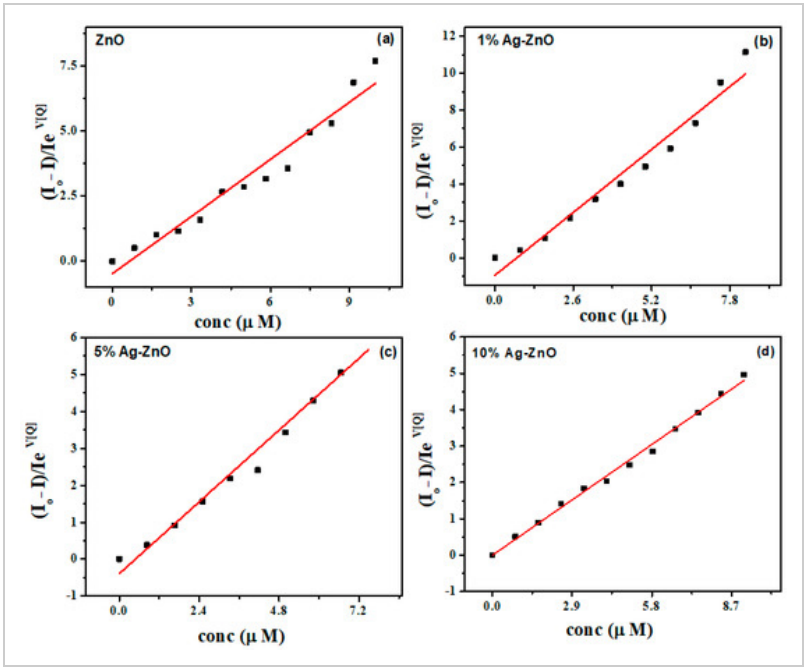

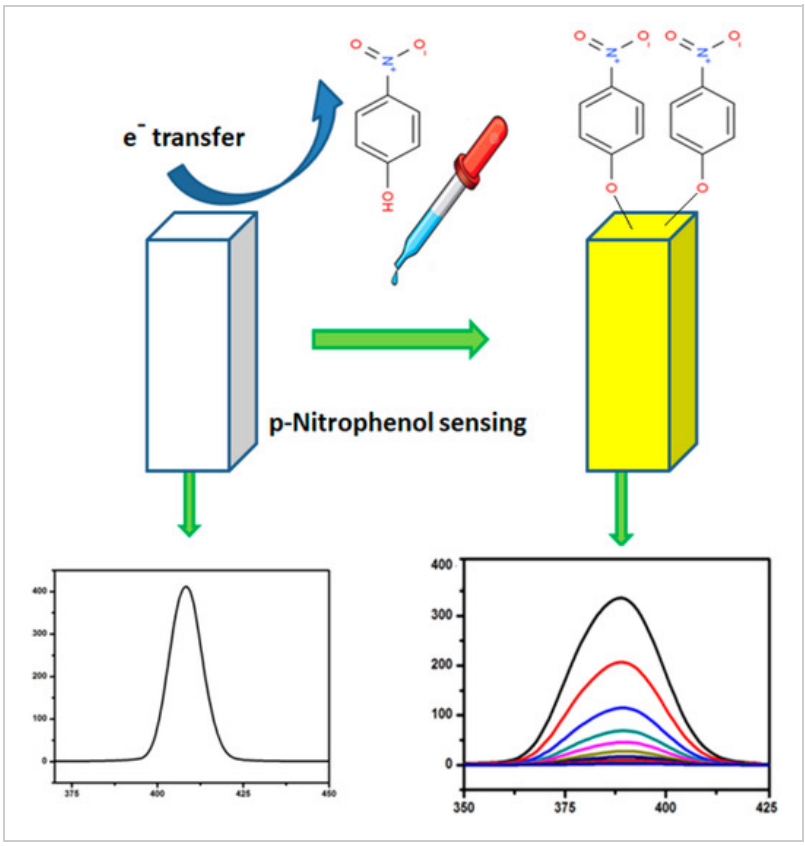

Figure 10. Modified Stern–Volmer plots of (**a**) ZnO, (**b**) 1% Ag-ZnO, (**c**) 5% Ag-ZnO and (**d**) 10% Ag doped ZnO nanostructures.

Scheme 1. Proposed mechanism for the photoluminescence sensing of PNP.

Table 2. Comparison of limits of detection (LODs) between synthesized Ag-ZnO nanostructures and various reported chemical sensors for PNP.

4. Conclusions

In summary, we successfully synthesized ZnO and Ag-doped ZnO nanostructures via a solution combustion process. The synthesized ZnO and Ag-ZnO nanostructures were characterized by using various characterization techniques, which revealed the large-scale synthesis of well-crystalline nanostructures and successful incorporation of Ag ions in the ZnO matrix, showing excellent chemical sensing properties. ZnO was found to show a low value of the limit of detection, i.e., 2.175 μM/L, for p-nitrophenol sensing; moreover, a sharp decrease in the limit of detection was observed with an increase in the concentration of silver ions, and the LOD value decreased to 0.669 μM/L for the 10% silver-doped zinc oxide. It is therefore concluded that Ag-doped ZnO shows a lower limit of detection as compared to pure ZnO for p-nitrophenol sensing. We observed a decrease in the particle size with an increasing Ag ion concentration, as well as the presence of silver also decreasing the electron hole recombination rate, which led to the enhancement of the surface area and Ag also behaving as an electron scavenger. Hence, there was an increase in the chemical sensing efficiency owing to the separation of charge carriers, resulting in the restriction of their recombination. It is concluded that Ag-doped ZnO nanostructures are promising candidates for the detection of p-nitrophenol.

Abstract

In the present work, lead-free magnetoelectric composites $(1-x)K_{0.5}Na_{0.5}NbO_3$–$(x)MnFe_2O_4$ (x=0, 0.2, 0.4, 0.6, 0.8, and 1) synthesized by solid-state reaction route have been studied for their structural, dielectric, and magnetoelectric properties. The micro-structural analysis (XRD, FESEM, EDX, FTIR, and RAMAN spectroscopy) indicates the coexistence of diphase in the composites. Compared to the individual phases, composites exhibit better electrical properties such as low leakage current, high resistivity, high dielectric constant, and low dielectric loss. I–V characteristics reveal that the conduction behavior of the composites is ohmic in nature in whole tested electric field range at room temperature. The maximum value of dielectric constant is noticed for composite with 20wt% of $MnFe_2O_4$ among the composites. The complex modulus analysis reveals the presence of non-Debye type phenomenon with spreading of relaxation time in the composites. Nyquist plots reveal that the composites exhibit polydispersive Maxwell–Wagner relaxation. The magnetic measurements indicate that the magnetic behavior of the composites lies on the mass content of $MnFe_2O_4$ phase. The magnetization increases with $MnFe_2O_4$ weight percentage which provides information regarding the magnetoelectric effect (ME) coupling between the magnetostrictive ferromagnetic and ferroelectric phases. Furthermore, ME effect is evaluated as a function of applied magnetic field. The highest ME response of 2.02mV/cm-Oe is observed for composite with 80wt% content of $MnFe_2O_4$. Findings of this research make these composites worthy material for environment-friendly ME device applications.

Introduction

Multiferroics belong to a new family of composite materials which exhibit two or more ferroic order (magnetic, electric, or elastic) at the same time. The coupling between different ferroic order induces a new effect termed as magnetoelectric effect (ME). ME effect based materials have ability to induce magnetization by an external electric field or polarization by an external magnetic

field due to the cross coupling between electric and magnetic ordering. The ME phenomenon is observed in both single phase as well as composite materials. The natural single phase 'ME multiferroics' were studied to some degree in 1960s and 1970s, but then slowed down due to their rare availability in nature, low Curie temperature, and the weak ME coupling output at room temperature, which limit their practical applications [1], [2], [3]. Due to the scarcity of single-phase materials, a lot of research work has been proposed to fabricate an alternative artificial multiferroic composites by merging the physically separable ferromagnetic and ferroelectric phases together at room temperature. The collaboration between, and the developments in, many areas of theory and experiment have fuelled the interest in such ME multiferroic composites in recent years. Theoretical characterization (multi-scale computational modeling) of these ME multiferroic composites and advent of nanotechnology have provided the understanding of the factors that promote strong ME coupling between magnetic and ferroelectric order parameters [4]. The existence of strong ME coupling in multiferroic composites provides the opportunities for potential applications in spintronics, memory devices, magnetic sensors, transducer, phase shifters, waveguides, and energy harvester [5], [6], [7], [8]. Generally, in order to attain strong ME coupling strength in multiferroics, ferromagnetic and ferroelectric phases should have high magnetostriction and piezoelectric co-efficient, respectively. In addition, highly resistive materials are equally desirable in order to avoid leakage current [9].

Since, ME response in composites is found to be high. The most of these high performance ME multiferroics use lead zirconate titanate (PZT) as ferroelectric phase due to its good pyroelectric, ferroelectric, and piezoelectric properties [10]. However, devices made by PZT based ME composites have environmental limitations due to the strong toxic nature of lead. Moreover, the use of lead in many commercial materials and applications has been prohibited, owing to concern regarding the environment pollution and human health [3], [10], [11]. Today, research has been now focused on the development and synthesis of lead-free environmental friendly magnetoelectric ceramics with an improved ME coefficient. At present, barium titanate ($BaTiO_3$) - based ferroelectric materials are mainly used to fabricate lead free ME composites. $BaTiO_3$-based lead free ME composites such as $BaTiO_3/Ni(Co,Mn)Fe_2O_4$ [9], $Ni_{0.8}Zn_{0.2}Fe_2O_4/Ba_{0.6}Sr_{0.4}TiO_3$ [12], $Na_{0.5}Bi_{0.5}TiO_3/MnFe_2O_4$ [13], $BaTiO_3/Ni_{0.8}Zn_{0.2}Fe_2O_4$ [14], $Na_{0.5}Bi_{0.5}TiO_3/Ni_{0.25}Mg_{0.5}Zn_{0.25}Fe_2O_4$ [10], and $CuFe_2O_4/BaTiO_3$ [15] have been reported. However, in order to obtain well dense $BaTiO_3$- based ME composite, it needs to sinter at a very high temperature (~1400°C), which is larger than the sintering temperature for spinel ferrite nano-materials. Furthermore, iron ions of magnetic phase get diffused into ferroelectric phase of $BaTiO_3$ at high sintering temperature, which decreases the Curie temperature of $BaTiO_3$, thus resulting in poor thermal stability [12]. Therefore, lead-free perovskite ceramics, $K_{1-y}Na_yNbO_3$ (KNN) is one of the best potential alternative to the $BaTiO_3$-based lead-free ME composites due to its excellent properties such as high Curie temperature (495°C), high piezoelectric properties (piezoelectric coefficient d_{33} =416 pC/N, planar coupling coefficient $k_P \approx 54\%$), biocompatibility, and more safe to human health [16], [17], [18]. $K_{1-y}Na_yNbO_3$ is a blend of potassium niobate (ferroelectric) and sodium niobate (anti-ferroelectric), and forms a morphotropic phase boundary near y=0.5 [19]. KNN has an orthorhombic perovskite structure at room temperature [3]. Among ferromagnetic ceramics, $MnFe_2O_4$ (MFO) ferrite having inverse spinel cubic symmetries exhibits excellent size dependent magnetic properties, high resistivity, high curie temperature, and high magnetostriction coefficient ($\lambda \sim -35\times10^{-6}$) [20], [21], [22]. Hence, MFO is a promising ferromagnetic material for growing ME composites.

The KNN-ferrite based ME composites studied are $CoFe_2O_4/K_{0.5}Na_{0.5}NbO_3$ [19], (1-x)[$K_{0.5}Na_{0.5}NbO_3$]-x[$Co(Mg_{0.05}Fe_{1.95})O_4$] [23], (1-x)$K_{0.5}Na_{0.5}NbO_3$-(x)$Ni_{0.5}Zn_{0.5}Fe_2O_4$ [24], $[Li_{0.06}(Na_{0.52}K_{0.48})_{0.94}]NbO_3/Ni_{0.9}Co_{0.1}Cu_{0.1}Fe_{1.9}O_4$ [25]. As per best of our knowledge, the investigation of multiferroism in KNN and MFO based ME composites are not reported yet. In the present study, an attempt has been made to synthesize (1-x)KNN-(x)MFO (x=0, 0.2, 0.4, 0.6, 0.8, and 1) composites using solid state sintering route having KNN and MFO as constituent of electric and magnetic order, respectively. The structural, electrical, dielectric, and magnetoelectric properties of KNN-MFO composites were investigated for the first time.

Section snippets

Experimental detail

Multiferroic KNN-MFO composites were prepared by solid state sintering method. Initially, the polycrystalline nanoparticles of ferroelectric KNN with basic composition of $K_{0.5}Na_{0.5}NbO_3$ were groomed by solid state reaction route. Briefly, analytical grade K, Na, and Nb acetate precursors were weighed according to required stoichiometry, and were mixed and ground in an agate mortar and pestle for 4h. After this, a solid mixer was submitted to calcine in a muffle furnace at 750°C for 4h to…

Structural and micro-structural analysis

Fig. 1 depicts the XRD patterns of bare KNN, bare MFO, and composites of KNN-MFO. It is noticed that only the expected diffraction peaks of KNN and MFO can be detected in their individual phase as well as in their composites without any trace of foreign phases.

Rietveld refinement was performed using FullProf program for further analysis of crystal structure. For refinement purpose, constituent phases were used from the available crystallography open database i.e. the COD-1011245 [27] and…

Conclusion

We have successfully groomed a lead free $(1-x)K_{0.5}Na_{0.5}NbO_3–(x)MnFe_2O_4$ composites by solid-state reaction technique. The KNN and MFO phases coexist in the composites which were successfully confirmed from XRD, FE-SEM, EDX, FTIR, and RAMAN analysis. The frequency dependent dielectric behavior of the composites is assigned to the Maxwell–Wagner polarization, activated by the presence of heterogeneity in the composites. With the addition of MFO content in bare KNN, the DC resistivity of the…

Abstract

In nano-thermites, due to improper contacts between the reactants in solid-state reaction, the complete energy release during redox-reaction is still challenging. Here, Fe_2O_3/Al nano-thermite is synthesized with different weight fraction of multi-layered graphene (MLG) nanoplatelets by physical mixing technique. X-ray diffraction reveals that the synthesis method does not change the phase of reactants. The morphology of nano-thermite is examined by scanning electron microscopy and transmission electron microscopy which reveals that MLG nanoplatelets are homogeneously dispersed in the samples. Structural stability of MLG nanoplatelets present in nano-thermite is observed by Raman spectroscopy. The nano-thermite reaction is analyzed by differential scanning calorimetry. The results show that an increase in MLG content in nano-thermite sample Al/Fe_2O_3, from 0wt% to 12wt% is responsible for increase in the corresponding exothermic enthalpy from 71J/g to 1537J/g. On the contrary, ignition temperature and activation energy of these samples get reduced with increasing MLG.

Sample preparation

Physical mixing method was adopted to synthesize nanopowders of Al/MLG/Fe_2O_3 thermites. This method involves the mixing of nanopowder of metal oxide, aluminium and MLG nanoplatelets in inert liquid using ultrasonic probe sonicator ((MAC-MSW347).

The ultrasonic waves help to break up the agglomerates and assist better mixing of fuel and oxidizer. The main advantage of this method is low-temperature synthesis which maintains chemical stability and chemical composition of constituents during the…

Structural and morphological analysis of Al/MLG/Fe_2O_3 nano-thermites

XRD pattern of (MLG, Al and Fe_2O_3) and Al/MLG/Fe_2O_3 nano-thermite with different weight percent of MLG (0–12 wt%) are shown in Fig. 1, Fig. 2. In the diffractograms (Fig. 1) only diffraction lines for α-Fe_2O_3 (PDF No. 39–1346) and Al (PDF no. 85–1327) and MLG (PDF No. 01–0646) are identified. In Fig. 2, it is evident that with an increase in the concentration of MLG in the Al/MLG/Fe_2O_3 thermite from (0–12 wt%), the graphitic peak around 26.4° (002) starts appearing. It is important to note that …

Conclusions

The Al/MLG/Fe_2O_3 nano-thermite samples are successfully synthesized by using physical mixing and ultrasonication techniques. The morphology study of prepared samples reveals the homogenous mixing of fuels (MLG, Al) and metal oxide (Fe_2O_3). Spectroscopy study shows the structure of MLG nanoplatelets, which remains stable during the whole synthesis process. The exothermic enthalpy of thermite reaction is observed to increase by increasing the weight content of MLG nanoplatelets in the Al/Fe_2O_3…

Exothermic behaviour of aluminium and graphene as a fuel in Fe_2O_3 based nanothermite

Priya Thakur, Vimal Sharma and Nagesh Thakur

From the journal Zeitschrift für Naturforschung A
https://doi.org/10.1515/zna-2021-0051

Abstract

The main frontier of this research is to study the influence of multi-layer graphene (MLG) and aluminium as a fuel in Al/Fe_2O_3 and MLG/Fe_2O_3 nanothermites, fabricated by physical mixing and ultrasonication techniques. To study the structural and energy release properties, prepared samples were characterized by XRD, FESEM, EDS, FTIR, Raman spectroscopy and DSC. The X-ray diffraction (XRD) technique showed that all the phases remain intact during the synthesis. Field emission electron microscopy (FESEM) micrographs displayed the surface morphology of the samples, and besides this, energy dispersive spectroscopy (EDS) was used to check the elemental composition of samples. Raman spectroscopy revealed that the ultrasonication waves did not deteriorate the aromatic structure of graphene sheets. Fourier transform infrared spectroscopy (FTIR) spectra were used to observe the information about various functional groups present in the thermite samples. The exothermic energy released by the thermite reaction in both the samples was investigated by differential scanning calorimetry (DSC) and the observed values of energy release for Al/Fe_2O_3 and MLG/Fe_2O_3 are 215 J/g and 1640 J/g.

Keywords: energetic materials; energy release; multi-layered graphene; physical mixing; thermite reaction

Abstract

Micro-sized copper powder (99.95%; O≤0.3) has been shock-processed with explosives of high detonation velocities of the order of 7.5km/s to observe the structural and microstructural sub-strengthening. Axisymmetric shock-consolidation technique has been used to obtain conglomerates of granular Cu. The technique involves the cylindrical compaction system wherein the explosive-charge is in direct proximity with the powder whereas the other uses indirect shock pressure with die-plunger geometry. Numeric simulations have been performed on with Eulerian code dynamics. The simulated results show a good agreement with the experimental observation of detonation parameters like detonation velocity, pressure, particle velocity and shock pressure in the reactive media. A pin contactor method has been utilized to calculate the detonation pressure experimentally. Wide angled x-ray diffraction studies reveal that the crystalline structure (FCC) of the shocked specimen matches with the un-shocked specimen. Field emissive scanning electron microscopic examination of the compacted specimens show a good sub-structural strengthening and complement the theoretical considerations. Laser diffraction based particle size analyzer also points towards the reduced particle size of the shock-processed specimen under high detonation velocities. Micro-hardness tests conducted under variable loads of 0.1kg, 0.05kg and 0.025kg force with diamond indenter optical micrographs indicate a high order of micro-hardness of the order of 159H_v. Nitrogen pycnometry used for the density measurement of the compacts shows that a compacted density of the order of 99.3% theoretical mean density has been achieved.

Abstract

$K_{0.5}Na_{0.5}NbO_3$ ceramic was synthesized at low calcination temperature by sol-gel route. Structural properties of ceramic were investigated by X-ray diffractometer, FESEM and FTIR spectrometer. Electro-optical properties of ceramic were investigated by UV-Vis and PL spectrometer. Dielectric nature of ceramic was studied at different frequencies and temperatures which disclosed that ceramic has maximum dielectric permittivity at 500 KHz. AC conductivity analysis shows negative temperature coefficient of resistance behavior. Leakage current was studied up to 180 V which shows low value of leakage current at room temperature. Ferroelectric nature was analyzed at different electric fields (5–20 $kVcm^{-1}$) at 50 Hz.

Abstract

The method of preparation and its processing parameters have a strong effect on the structure and non-linear properties of the materials. A sol–gel technique is highly favoured owing to its lower production temperature, nanoparticle size, inter-diffusion of cations and cost-effectiveness. Sodium potassium niobate (KNN) is the most capable environmentally friendly material, which has been studied for the last decades as a promising candidate among all lead-free perovskites materials. In this article, we have prepared KNN ceramics by using the wet chemical sol–gel route. To control the volatility of (Na, K) ions at higher production temperature, we have added 10–20% (Na, K) alkali metal in the precursor solution. The phase investigation and crystalline character of the ceramics have been analysed by X-ray diffractometer. Raman spectroscopy analysis disclosed that pure KNN ceramic has a better crystalline and perovskite structure. FTIR analysis is done to analyse the presence of the functional group in the wavenumber range of 4000–500 cm^{-1}. The surface microstructure analysis and morphology of the KNN ceramics have been studied by using field emission scanning electron microscopy techniques. Further, the optical and photoluminescence behaviour has been studied at room temperature to know its practical applications in various electro-optic device applications.

Abstract

Shell structure evolution in isotopes (even Z and even N) of Silicon (Si), Sulphur (S), Argon (Ar) and Calcium (Ca) has been analysed. We have used both Relativistic Hartree-Bogoliubov theory and Non-Relativistic Hartree-Fock-Bogoliubov theory for the theoretical calculations of the physical observables of interest. We have employed the model based on Relativistic Hartree-Bogoliubov theory with the density dependent effective interactions of meson exchange and point coupling types. Calculations based on Hartree-Fock-Bogoliubov theory are carried out with different skyrme forces and their sensitivity has been tested. Physical observables of interest include binding energies, single neutron separation energies, two-neutron separation energies, shell closure parameter D_n (Z, N) and differential variation dS_{2n}(Z, N) based on two neutron separation energy. Our theoretical results gives indication of shell closure at neutron number N =14 and neutron number N = 20 for the nuclei of Silicon (Si). Shell closures at neutron numbers N = 14, 20 and neutron number N = 28 are observed for Sulphur (S) nuclides. Argon (Ar) and Calcium (Ca) isotopes also provides the signature of shell closures at neutron numbers N = 20 and neutron number N = 28.

Introduction

One of the key problem in nuclear physics is the understanding of atomic nucleus due to the complexity of the many body system. Certain configurations of nucleons (magic numbers) in nucleus are observed to be more stable (magic nuclei). The study of those special nuclei (magic nuclei) near the dripline is an active and open area of research in the field of nuclear structure physics [1]. The nuclei which are away from the β-stability line, play an important role in the understanding of nuclear physics. The production of the new isotopes [2], [5] in recent years has revived a great interest in nuclear structure models. This has also provoked the facilities like radioactive ion beam (RIB) technologies, ultrasensitive and sophisticated detectors as well [3], [4]. Till today, very little information is available about those nuclei which are lying near driplines (exotic or halo nuclei).

It is also true that the undiscovered nuclei that are stable and forms bound system are very large in number and we can not study all of them but we are able to make an effective step by examining a few of them. We have chosen Silicon (Si), Sulphur (S), Calcium (Ca) and Argon (Ar) nuclei for our study as a lot of research work already has been done on these mentioned nuclei recently [2], [39], [22]. The microscopic study of nuclei is of great interest for astrophysics field also. As Silicon (Si), Sulphur (S), Argon (Ar) and Calcium (Ca) nuclides also become experimentally accessible, so they can prove to be a testing ground for the study of exotic nuclei. In light to middle mass nuclei, the departure from the regular magic numbers and arrival of new magic numbers between the region of drip lines and the line of the stability is compelling problem in the nuclear structure physics, especially of exotic nuclei [6], [7]. The conventional or the regular picture of the magic numbers to which we are generally familiar, is no longer valid to the many exotic nuclides both in theoretical and experimental extractions as reported in ref. [8], [9], [10], [11], [12], [13], [14]. Some of the authors in references [49], [50], [51], [53] have examined theoretically and experimentally, the indication of the Neutron number N = 34 as the shell closure in the isotopes of Ca and Ti. HFB theory has been continuously used to study the nuclear structure properties of various nuclides which are part of the periodic table [45], [46], [47], [48].

To study the physics of shell structure evolution in exotic neutron-rich and magic-nuclei of Silicon (Si), Sulphur (S), Argon (Ar) and

Typesetting math: 100%

Calcium (Ca) isotopes away from the stability line, we have performed our theoretical calculations with Hartree-Fock-Bogoliubov (HFB) theory enriched by the Skyrme effective interactions [15], [16]. The nuclear many-body dynamics can also be understood very well by using Covariant Density functional theory and its successes and the applications can be found in references [52]. CDFT is the more general expression and it simply means 'covariant density functional theory', i.e. density functional theory in a covariant form. On the other hand, RHB is the relativistic version of Hartree-Fock-Bogoliubov theory introduced originally for a non-relativistic Hamiltonian. As we distinguish in the non-relativistic case Hartree-Fock, Hartree+BCS and full Hartree-Bogoliubov (or HF, HF+BCS, HFB) models, we also distinguish in the relativistic case RMF, RMF+BCS and RHB models. All of these are special cases of CDFT. In our manuscript, Relativistic Hartree-Bogoliubov (RHB) model [54] with density dependent effective interactions of types point coupling (DD-PCX [36] and DD-PC1 [30]) and meson exchange (DD-ME2 [29]). Effective interactions are employed with the inclusion of separable pairing interaction [17], [18], [35]. RHB theory has been tested several times and its successes involes the appreciable description of nuclei near the drip lines (exotic nuclides) [55], [56], [57], [58], [60]. It has also been used to study the deformed exotic nuclides as reported in references [61], [62], [63], [64]. Studies related to the shell structure and shell closure based on Covariant DFT are also available in literature [65], [66], [67]. All these studies make this theory really a promising one to investigate the many body systems. In this presented work, we have theoretically calculated the results for Single neutron separation energies, two neutron separation energies and shell closure parameters.

The organisation of the presented paper is as follows. An overview of HFB theory and RHB theory with employed effective interactions is presented in Section 2. In the Section 3, the results for our theoretical calculations are shown and also compared with the recently experimental data. The results in the present work are summarized in Section 4.

Section snippets

Theoretical framework

This presented work is carried out with the use of the theoretical models based upon Hartree-Fock-Bogoliubov [19], [20], [15] and Relativistic Hartree Bogoliubov (RHB) Theory [21]. A brief discussion of these models is given below.…

Numerical details

The theoretical calculations are carried out within the framework of HFB theory and RHB theory discussed briefly in the previous section. HFB Calculations are carried out for different skyrme parameterizations by using the HFB code [15] with harmonic oscillator basis. RHB calculations are computed with DIRHB code [17]. Spherical approximation is adopted for the nuclear shape in our RHB and HFB calculations with the center of mass correction $E_{cm} = -P_{cm}^2/2Am$, where P_{cm} is the total momentum of…

Results and discussions

We present our computed results of Binding Energies, single neutron separation energies S_n(Z, N), shell closure parameter $D_n(Z,N)$, two neutron separation energies S_{2n}(Z, N) and the differential variation of the two-neutron separation energy $dS_{2n}(Z,N)$ for the isotopic chains of Si, S, Ar and Ca nuclides.…

Conclusions

We have got some of the very important conclusions based upon our theoretical estimations presented in this paper by employing Nuclear Density Functionals based on Relativistic-Hartree-Bogoliubov (RHB) and Hartree-Fock-Bogoliubov (HFB) theory with the different parameterizations discussed briefly in the previous sections. The evolution of shell structures in the even-even isotopes of Silicon, Sulphur, Argon and Calcium has been extensively analysed. The physical quantities such as $D_n(N)$ and dS_{2n}…

Abstract

We have done the microscopic study of neutron-rich odd-odd iodine isotopes within the framework of projected shell model. Odd-odd nuclei are the best candidates for studying possible structure variations away from the valley of stability. We used the projected shell model, in which the deformed Nilsson single-particle states are being used for the construction of model basis. We studied the band properties of odd-odd I (Z= 53) isotopes with neutron numbers N= 75, 77, 79, 81, 83 and 85. Using model analysis, we presented the low-lying positive- and negative-parity states of these nuclei. In these isotopes, the band structures have been analyzed in terms of quasi-particle configurations and comparative presentation of yrast levels is discussed. The phenomenon of yrast energy splitting is also studied in this work.

Abstract

In this paper, we investigated the shape evolution and ground-state properties of $^{108-144}$I isotopes using Hartree–Fock-Bogoliubov Model while employing the axially deformed single-particle harmonic oscillator basis for the expansion of quasiparticle wave functions. We have used SKP and UNEDF2 models to perform the theoretical calculations. We have presented the shape evolution and final values of the quadrupole deformation parameter β_2 of iodine isotopes. We have used the final values of the β_2 for studying the ground-state properties of the iodine isotopic chain. The investigated ground-state properties are the nuclear electric quadrupole moment, single-particle energy levels, the binding energy per nucleon, pairing energy, one-neutron separation energy, two-neutron separation energy, nuclear charge radius, neutron rms radius, proton rms radius, and neutron skin thickness. After using the SKP parameterization on ^{109}I, we have observed the shape coexistence of prolate and oblate shape. Similarly, after using the UNEDF2 parameterization on ^{110}I, ^{112}I, ^{114}I, ^{115}I, ^{116}I, ^{117}I, ^{118}I, and ^{119}I, we discover the shape coexistence of prolate and oblate shape.

Nuclear shape evolution and shape coexistence in Zr and Mo isotopes

Pankaj Kumar, Virender Thakur, Smriti Thakur, Vikesh Kumar & Shashi K. Dhiman

The European Physical Journal A **57**, Article number: 36 (2021)

559 Accesses | **8** Citations | **1** Altmetric | Metrics

Abstract

The phenomena of shape evolution and shape coexistence in even–even $^{88-114}$Zr and $^{90-116}$Mo isotopes are studied by employing covariant density functional theory (CDFT) with density-dependent point-coupling parameter set, DD-PCX, and with separable pairing interaction. The results for the rms deviation in binding energies, two-neutron separation energy, the differential variation of two-neutron separation energy, and rms charge radii, as a function of neutron number, are presented and compared with available experimental data. In addition to the oblate–prolate shape coexistence in $^{96-110}$Zr isotopes, the correlations between shape transition and discontinuity in the observables are also examined. A smooth trend of charge radii in Mo isotopes is found to be due to the manifestation of triaxiality softness. The observed oblate and prolate minima are related to the low single-particle energy level density around the Fermi level of neutron and proton, respectively. The rapid shape transition in Zr isotopes near $N \approx 60$ is identified to be caused by the evolution of the shell structure associated with massive proton excitations to $1\pi g_{9/2}$ orbit. The present calculations also predict a deformed semi-bubble structure in the ^{100}Zr isotope.

ABSTRACT

Lifetime measurements have been carried out for the levels of the negative parity yrast sequence in $^{103}\mathrm{Pd}$ nucleus using the Doppler shift attenuation method. The levels were populated via $^{94}\mathrm{Zr}\left(^{13}\mathrm{C},\ 4n\gamma\right)^{103}\mathrm{Pd}$ fusion-evaporation reaction at a beam energy of 55 MeV. De-exciting γ rays were detected by utilizing the Indian National Gamma Array. The extracted transition probabilities and other auxiliary observations indicate that the sequence may be resulting from the antimagnetic rotational (AMR) motion of valence nucleons. The key characteristic feature of the AMR motion is the steady decrease of the $B(E2)$ transition probability with spin, which is seen in the present measured transitions for $^{103}\mathrm{Pd}$. The experimental results are compared with the theoretical predictions of tilted axis cranked approach based on the covariant density functional theory. It is noted that the properties of the AMR band structure for $^{103}\mathrm{Pd}$ predicted in this model analysis are in good agreement with the present experimental findings. Further, semi-classical particle-rotor model has been employed to substantiate the AMR interpretation of the observed band structure in $^{103}\mathrm{Pd}$ and it is shown that results are similar to the band structures observed in the neighboring isotopes, which have also been considered as candidates for AMR motion.

EVOLUTION OF NUCLEAR SHAPES IN LIGHT NUCLEI FROM PROTON- TO NEUTRON-RICH SIDE

Pankaj Kumar†, Virender Thakur, Smriti Thakur
Vikesh Kumar, Shashi K. Dhiman

Department of Physics, Himachal Pradesh University
Summer-Hill, Shimla-171005, India

(Received February 2, 2021; accepted April 19, 2021)

The relativistic Hartree–Bogoliubov (RHB) model with density-dependent meson-exchange interaction and separable pairing is employed to study the shape evolution and shape coexistence in Mg ($Z = 12$), Si ($Z = 14$), S ($Z = 16$), and Ar ($Z = 18$) isotopes from proton-rich side to neutron-rich side. A sudden shape transition is observed in these isotopic chains. A reasonable agreement of quadrupole deformation is found with the finite range droplet model (FRDM). Our findings of binding energies, quadrupole deformation parameter, charge radii, and isotope shifts are also in good agreement with the results of Hartree–Fock–Bogoliubov calculations based on the D1S-Gogny force. In addition to shape evolution, the disappearance of $N = 28$ shell closure and onset of deformation is also observed towards the neutron-rich side. The modification of $N = 28$ shell gap is related to the quadrupole excitations across it. The present calculations infer the neutron drip line at ^{40}Mg.

DOI:10.5506/APhysPolB.52.401

1. Intoduction

The study of nuclei far from the β-stability line (exotic nuclei) is a devoted part of modern nuclear-structure studies. The limit of nuclear existence is reached while going away from the stability line. Nuclear drip lines form the edges of the nuclear chart and are defined as limits beyond which a single nucleon becomes unbound in the nuclear ground state. The advancement in Radioactive Ion Beam (RIB) facilities and sensitive detection technologies has made it accessible to study the structure and properties of these nuclei.

† Corresponding author: pankajdhiman659@gmail.com

The evolution of ground-state shape from proton-rich side to neutron-rich side is a frontier area in nuclear physics. The shape evolution in isotonic or isotopic chains has been investigated consistently by various theoretical and experimental techniques. The results obtained from the electron and in-beam spectroscopy experiment reveal the prolate-spherical shape coexistence for ^{44}S, with intruder configuration being the ground state [1, 2]. This intruder ground state was predicted to be due to the quadrupole excitation across the $Z = 14$ and $N = 28$ shell gaps. An exhaustive study of the evolution of shapes and other ground-state properties in light nuclei is done in Ref. [3]. They have employed relativistic mean-field (RMF) theory with NL-SH force and with BCS pairing in the calculations. The nuclear deformation in light even–even isotopes has been investigated with the Hartree–Fock–Bogoliubov (HFB) model using SLy4 Skyrme parameterization [4]. The relation between single-particle motion and potential energy surfaces has been studied by taking deformation into account. The large-amplitude collective dynamics of shape phase transition in the low-lying states of $^{30-36}$Mg and shape coexistence in excited 0^+ state in ^{32}Mg has been investigated in Refs. [5, 6], respectively. The study of shape evolution for $^{28-42}$Si isotopes has been done within the framework of the Skyrme–Hartree–Fock model by employing BCS approximation for the pairing channel [7]. Shape coexistence and triaxial deformation in Ne, Na, Mg, and Al isotopes have also been studied by Davies *et al.* [8]. One of the prominent subjects in the study of nuclear structure of exotic nuclei, in the light region, is the evanescence of the traditional magic numbers and the emergence of new ones. The weakening of the $N = 28$ shell closure and the development of deformation has been observed in low-energy Coulomb excitation experiments [9–11]. Their study indicated a prolate shape of the ^{44}Ar nucleus by calculating B(E2) values and the spectroscopic quadrupole moment of the 2_1^+ state from the differential Coulomb excitation cross sections. Many theoretical studies have been done on the shape evolution in $N = 28$ isotones and reduction of shell gaps [12–15].

The nuclear density functional theories have been used to understand nuclear many-body dynamics for an appreciable description of nuclei near the drip lines [16–22]. The RHB model has been employed to study shell structure of Si, S, Ar, and Ca isotopes in recent papers [18–20]. In these papers, binding energies and their derivative properties have been studied by taking considering spherical symmetry. Their results indicate the presence of $N = 14$ sub-shell closure and also reproduce the traditional magic numbers ($N = 8$, 20, and 28). However, to throw some light on the effect of deformation on light nuclei from proton to neutron-rich side, we have performed quadrupole constrained RHB calculations using density-dependent meson exchange (DD-ME2) parameter set [23] with pairing interaction which is

separable in momentum space. An extensive study of shape evolution and shape coexistence is done for Mg, Si, S, and Ar even–even isotopes. The other ground-state observables are also studied. The present calculations do not provide any indication about $N = 14$ sub-shell closure in these isotopes rather, the disappearance of $N = 28$ shell closure is observed. In the present manuscript, we have briefly presented the impact of deformation on the shell structure of even–even Mg, Si, S, and Ar isotopes.

The organization of this paper is as follows: A brief description of the RHB model with meson-exchange coupling and with separable pairing is presented in Section 2. Results and discussion for shape evolution and various ground-state observables, compared with experimental data, are presented in Section 3. Finally, the concluding remarks of the present analysis are given in Section 4.

2. Theoretical framework

Self-consistent mean-field (SCMF) models provide a very successful tool to study nuclear ground-state properties and excited-state properties from the valley of β-stability to the nuclear drip lines throughout the entire nuclear chart. These models are based on the nuclear energy density functionals (EDF) in which the nucleons are treated as independent particles moving inside the nucleus under the influence of potentials that are derived from such functionals [24]. In the relativistic case, the nucleons are treated as Dirac spinors that interact by the exchange of virtual mesons, as described by Refs. [25–29].

2.1. Lagrangian density for the meson exchange models

The total Lagrangian density of mesons exchange model can be written as [23, 30]

$$\begin{aligned}\mathcal{L} \;=\; & \sum_i \bar{\psi}_i(i\gamma_\mu\partial^\mu - m)\psi_i + \tfrac{1}{2}\partial_\mu\sigma\partial^\mu\sigma - \tfrac{1}{2}m_\sigma^2\sigma^2 - \tfrac{1}{2}\Omega_{\mu\nu}\Omega^{\mu\nu} \\ & + \tfrac{1}{2}m_\omega^2\omega_\mu\omega^\mu - \tfrac{1}{4}\vec{\boldsymbol{R}}_{\mu\nu}\vec{\boldsymbol{R}}^{\mu\nu} + \tfrac{1}{2}m_\rho^2\vec{\rho}_\mu\cdot\vec{\rho}^\mu - \tfrac{1}{4}\boldsymbol{F}_{\mu\nu}\boldsymbol{F}^{\mu\nu} \\ & - g_\sigma\bar{\psi}\psi\sigma - g_\omega\bar{\psi}\gamma^\mu\psi\omega_\mu - g_\rho\bar{\psi}\vec{\tau}\gamma^\mu\psi\cdot\vec{\rho}_\mu - e\bar{\psi}\gamma^\mu\psi A_\mu\,, \end{aligned} \tag{1}$$

where m denotes the bare mass of nucleon and ψ denotes the Dirac spinors. m_σ, m_ω, m_ρ are masses of σ, ω, ρ mesons with corresponding coupling constants g_σ, g_ω, g_ρ for the mesons to the nucleons, respectively. $\Omega_{\mu\nu}$, $\vec{R}_{\mu\nu}$, $F_{\mu\nu}$ are field tensor of the vector fields ω, ρ, and the photon. Arrows denote isovectors and boldface symbols are used for vectors in ordinary space.

From the Lagrangian density in Eq.(1), one can obtain the Hamiltonian density $\mathcal{H}(\boldsymbol{r})$ and hence obtain the total energy which depends on the Dirac spinors and the meson fields by integrating the Hamiltonian density over the r-space [31]

$$\begin{aligned}\mathcal{E}_{\mathrm{RMF}}\left[\psi,\bar{\psi},\sigma,\omega^{\mu},\vec{\rho}^{\,\mu},A_{\mu}\right] &= \int \mathrm{d}^3r\mathcal{H}(\boldsymbol{r}) = \sum_{i=1}^{A}\int \mathrm{d}^3r\psi_i^{\dagger}(\boldsymbol{\alpha p}+\beta m)\psi_i \\ &+\frac{1}{2}\int \mathrm{d}^3r\left((\nabla\sigma)^2+m_{\sigma}^2\sigma^2\right)-\frac{1}{2}\int \mathrm{d}^3r\left((\nabla\omega)^2+m_{\omega}^2\omega^2\right) \\ &-\frac{1}{2}\int \mathrm{d}^3r\left((\nabla\rho)^2+m_{\rho}^2\rho^2\right)-\frac{1}{2}\int \mathrm{d}^3r(\nabla A)^2 \\ &+\int \mathrm{d}^3r\left(g_{\sigma}\rho_s\sigma+g_{\omega}j_{\mu}\omega^{\mu}+g_{\rho}\vec{j}_{\mu}\cdot\vec{\rho}^{\,\mu}+ej_{p\mu}A^{\mu}\right). \end{aligned} \tag{2}$$

The single-nucleon Dirac equation is derived by variation of the energy density functional (2) with respect to $\bar{\psi}$ and takes a simple form that includes only the vector potential $V(\boldsymbol{r})$ and the effective mass $M^*(\boldsymbol{r}) = m + g_{\sigma}\sigma$

$$\{-i\boldsymbol{\alpha}\nabla+\beta M^*(\boldsymbol{r})+V(\boldsymbol{r})\}\psi_i(\boldsymbol{r}) \;=\; \epsilon_i\psi_i(\boldsymbol{r})\,. \tag{3}$$

The vector potential reads

$$V(\boldsymbol{r}) = g_{\omega}\omega+g_{\rho}\tau_3\rho+eA_0+\Sigma_0^{\mathrm{R}}\,, \tag{4}$$

where Σ_0^{R} denotes the rearrangement term arising from the density dependence of the vertex functions (g_{σ}, g_{ω} and g_{ρ}) and is defined as

$$\Sigma_0^{\mathrm{R}} = \frac{\partial g_{\sigma}}{\partial\rho_v}\rho_s\sigma+\frac{\partial g_{\omega}}{\partial\rho_v}\rho_v\omega+\frac{\partial g_{\rho}}{\partial\rho_v}\rho_{tv}\rho\,. \tag{5}$$

ρ_{tv} denotes the isovector density which is the difference between the proton and the neutron vector density. The functionals are described by density-dependent coupling constants $g_i(\rho)$ (for $i = \sigma,\omega,\rho,\delta$). The coupling of σ field and ω field to the nucleon field is given by [32–34]

$$g_i(\rho) = g_i(\rho_{\mathrm{sat}})f_i(x) \quad \text{for} \quad i=\sigma,\omega \tag{6}$$

with

$$f_i(x) = a_i\frac{1+b_i(x+d_i)^2}{1+c_i(x+d_i)^2} \tag{7}$$

which is a function of $x = \rho/\rho_{\mathrm{sat}}$. Here, ρ_{sat} ($= 0.152$ fm^{-3}) is the baryon density at saturation in symmetric nuclear matter.

For density dependence of ρ-meson coupling, Dirac–Brueckner suggested the functional form [35], given by

$$g_{\rho}(\rho) = g_{\rho}(\rho_{\mathrm{sat}})\mathrm{e}^{-a_{\rho}(x-1)}\,. \tag{8}$$

The isovector channel is parameterized by $g_{\rho}(\rho)$ and a_{ρ}.

2.2. Relativistic Hartree–Bogoliubov approximation with a separable pairing interaction

The incorporation of pairing correlations is important to understand the structure phenomena in open shell nuclei quantitatively [36, 37]. The formulation of RHB model is found to be a relativistic extension of the HFB model in which mean-field and pairing correlations are treated self-consistently. The RHB model provides a unified description of particle–hole (*ph*) and particle–particle (*pp*) correlations on a mean-field level by using the average self-consistent mean-field potential that encloses the long-range *ph* correlations and a pairing field potential which sums up the *pp* correlations. In the RHB model, density matrix in the presence of pairing can be generalized in two densities, the normal density $\hat{\rho}$, and pairing tensor $\hat{\kappa}$. The relativistic Hartree–Bogoliubov energy density functional can be written as

$$E_{\mathrm{RHB}}[\hat{\rho},\hat{\kappa}] = E_{\mathrm{RMF}}[\hat{\rho}] + E_{\mathrm{pair}}[\hat{\kappa}]\,, \tag{9}$$

where $E_{\mathrm{RMF}}[\hat{\rho}]$ is the nuclear energy density functional and is given in Eq. (2). The pairing part of RHB functional is given by

$$E_{\mathrm{pair}}[\hat{\kappa}] = \frac{1}{4}\sum_{n_1 n_1'}\sum_{n_2 n_2'} \kappa^*_{n_1 n_1'} \left\langle n_1 n_1' \middle| V^{\mathrm{PP}} \middle| n_2 n_2' \right\rangle \kappa_{n_2 n_2'}\,, \tag{10}$$

where $\left\langle n_1 n_1' | V^{\mathrm{PP}} | n_2 n_2' \right\rangle$ are the matrix elements of the two-body pairing interaction, and indices n_1, n_1', n_2, and n_2' denote quantum numbers that specify the Dirac indices of the spinor. The quasiparticle wave functions U_k and V_k are obtained by the variational principle from the solution of relativistic Hatree–Bogoliubov equations. In coordinate representation

$$\begin{pmatrix} h_{\mathrm{D}} - m - \lambda & \Delta \\ -\Delta^* & -h^*_{\mathrm{D}} + m + \lambda \end{pmatrix} \begin{pmatrix} U_k(r) \\ V_k(r) \end{pmatrix} = E_k \begin{pmatrix} U_k(r) \\ V_k(r) \end{pmatrix}. \tag{11}$$

In the self-consistent relativistic mean-field calculation, $\hat{h}_{\mathrm{D}}$ is the single-nucleon Dirac Hamiltonian and m is the mass of nucleon. The λ chemical potential is determined by the particle number subsidiary condition such that the expectation value of the particle number operator in the ground state equals the number of nucleons. The pairing field Δ reads

$$\Delta_{n_1 n_1'} = \frac{1}{2}\sum_{n_1 n_2'} \left\langle n_1 n_1' \left| V^{\mathrm{PP}} \right| n_2 n_2' \right\rangle \kappa_{n_2 n_2'}. \tag{12}$$

The pairing force is separable in momentum space and in r-space has the form of

$$V^{\mathrm{PP}}\left(\boldsymbol{r_1}, \boldsymbol{r_2}, \boldsymbol{r_1'}, \boldsymbol{r_2'}\right) = -G\delta\left(\boldsymbol{R} - \boldsymbol{R'}\right) P\left(\boldsymbol{r}\right) P(\boldsymbol{r'})\,, \tag{13}$$

where $\boldsymbol{R} = \frac{1}{\sqrt{2}}(\boldsymbol{r_1} + \boldsymbol{r_2})$ and $\boldsymbol{r} = \frac{1}{\sqrt{2}}(\boldsymbol{r_1} - \boldsymbol{r_2})$ represent the center of mass and the relative coordinates, respectively, and the form factor $P(\boldsymbol{r})$ is of the Gaussian form written as

$$P(\boldsymbol{r}) = \frac{1}{(4\pi a^2)^{3/2}} \mathrm{e}^{-r^2/2a^2} . \tag{14}$$

The two parameters G and a have been adjusted to reproduce the density dependence of gap at the Fermi surface. The values of these parameters in the present work are taken as $G = 728$ MeV fm^3 and $a = 0.644$ fm for protons and neutrons. It is derived in Refs. [36, 38–40] calculated with the DIS Gogny force. The pairing force has a finite range and also it conserves translational invariance due to the presence of the factor $\delta(\boldsymbol{R} - \boldsymbol{R'})$. Even though this force is not completely separable in coordinate space, however, the anti-symmetrized *pp* matrix elements can be represented as a sum of a finite number of separable terms in the harmonic oscillator basis

$$\left\langle n_1 n_2 \left| V^{\mathrm{PP}} \right| n_1' n_2' \right\rangle_a = \sum_N W^{N*}_{n_1 n_2} W^N_{n_1' n_2'} . \tag{15}$$

The pairing field Δ, in this case, takes the form

$$\Delta_{n_1 n_2} = \sum_N P_N W^{N*}_{n_1 n_2} \quad \text{with} \quad P_N = \frac{1}{2} \mathrm{Tr}\left(W^N \kappa\right) , \tag{16}$$

and finally, the pairing energy in the nuclear ground state is given by

$$E_{\mathrm{pair}} = -G \sum_N P^*_N P_N . \tag{17}$$

The total energy E_{tot} [MeV] for the nuclear system with A (mass number) nucleons can be calculated as [41]

$$E_{\mathrm{tot}} = E_{\mathrm{RMF}} + E_{\mathrm{pair}} + E_{\mathrm{cm}} . \tag{18}$$

Here, E_{cm} accounts for the center-of-mass correction and is given as $E_{\mathrm{cm}} = -\frac{\langle \boldsymbol{P}^2 \rangle}{2Am}$, where $\langle \boldsymbol{P} \rangle = \sum_i^A \boldsymbol{p_i}$ is the total momentum of the nucleus in the center-of-mass frame with A nucleons [42].

2.3. Details of calculations

The pairing correlations play an important role in the understanding of ground-state properties of the open-shell nuclei. Pairing has been included in the relativistic Hartree–Bogoliubov model in the form of simple constant

gap approximation, where the pairing gap Δ is obtained from odd–even mass differences. The input parameters required to carry out explicit numerical calculations are [26]: *(i)* the baryon and meson masses m, m_σ, m_ω, and m_ρ; *(ii)* the coupling constants of the meson fields to the nucleons g_σ, g_ω, and g_ρ; *(iii)* the number of oscillator shells for fermions and bosons (N_F and N_B); *(iv)* the basis parameters used for the expansion of the Dirac spinor and the meson fields. The meson masses and the coupling constants, calculated using χ^2 fitting procedure, for the DD-ME2 interaction are

$$\begin{aligned} M &= 939 \text{ MeV}, & m_\sigma &= 550.1238 \text{ MeV}, & m_\omega &= 783 \text{ MeV}, \\ m_\rho &= 763 \text{ MeV}, & g_\sigma &= 10.5396, & g_\omega &= 13.0189, \\ g_\rho &= 3.6836. \end{aligned}$$

For the calculations of the shape evolution and ground-state properties, we have used the DIRHBZ numerical code developed by Nikšić *et al.* [31].

In the mean-field formalism, the maximum number of harmonic oscillator shells in the expansion of fermion and boson fields have to be used to achieve a reliable convergence. However, the computation time increases dramatically with the increase in number of shells. This problem can be tackled by limiting the number of shells, that can be done by studying the convergence behavior. In the present work, we have chosen $N = 28$ isotones of Mg, Si, S, and Ar to obtain the reliable values of binding energy per nucleon, charge radius ($R_{\rm ch}$), and quadrupole deformation parameter (β_2) by performing calculations with the number of oscillator shells ranging from $N_F = N_B = 12$–20. Figure 1 presents the results of total binding energy, binding energy per nucleon (E/A), charge radius ($R_{\rm ch}$), and quadrupole deformation parameter, β_2 (*optimized for each constrained value of deformation parameter*) as a function of the number of oscillator shells ($\boldsymbol{N}$). The variation of binding energy with an increase in number of oscillator shells is 0.12% for ^{40}Mg while, this variation is around 0.03% for $N = 28$ isotones of Si, S, and Ar. The increase of $N_F = N_B$ from 12 to 20 changes the E/A by about 0.12–0.03% and $R_{\rm ch}$ by 0.14–0.06%, while quadrupole deformation parameter β_2 by 2–4% for these isotones of $N = 28$. Therefore, to save computation time and to obtain reasonably converging mean-field solutions, 12 major oscillator shells are adopted in the present study.

In principle, the harmonic oscillator (HO) basis has served as an extremely useful tool in the nuclear structure study. However, for weakly bound systems with large spatial extension, it does not work due to its localization [43]. One has to use extremely large major oscillator shells to reproduce the density of a weakly bound nucleus, which is not feasible in practice (see Figs. 1 and 2 in Ref. [43]). The RHB equations are solved in coordinate space for the description of halo nuclei [44–46]. Later on, it was

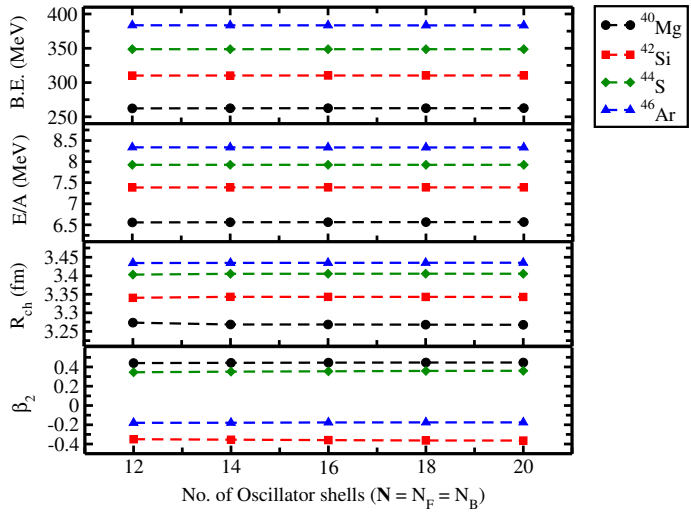

Fig. 1. The results of convergence study of the total binding energy, binding energy per nucleon, charge radii ($R_{\rm ch}$), and quadrupole deformation parameter (β_2) for $N=28$ isotone of Mg, Si, S, and Ar nuclei as a function of oscillator shells ($\boldsymbol{N}=N_F=N_B$).

observed that the solution of RHB equations in Woods–Saxon (WS) basis provides a successful description of drip-line nuclei [47–50] where the radial wave function has a proper asymptotic behavior at a large distance from the center. Therefore, the WS basis is recommended over the HO basis for solving RHB equations in weakly bound systems.

3. Results and discussion

3.1. Quadrupole deformation and shape coexistence

The main purpose of the present work is to study the deformation systematics in light nuclei from proton-rich side to neutron-rich side. We have performed axially constrained RHB calculations using DD-ME2 parameter set for the entire isotopic chain of Mg, Si, S and Ar to obtained the variation of binding energies with respect to quadrupole deformation parameter β_2. In mean-field approximations, the quadrupole deformation parameter β_2 is related to intrinsic quadrupole moment Q_{20} and is defined as

$$\beta_2 = \sqrt{\frac{5\pi}{9}}\frac{Q_{20}}{AR_0^2}, \tag{19}$$

with $R_0 = 1.2A^{1/3}$. The resulting plots of total energy *versus* quadrupole deformation are called potential energy curves (PECs). The analysis of

shape evolution starts with a self-consistent relativistic Hartree–Bogoliubov (RHB) calculation of quadrupole binding energy curves. It has been studied in Ref. [50] that at the local minimum in the PEC, the constrained and the unconstrained solutions are identical. One would have the same ground state with the self-consistent unconstrained calculations. Sometimes, however, the constrained calculations are also necessary for a soft PEC, or if many local minima are close to each other. We have used a small step of deformation in the present calculations to obtain the ground state of various nuclei. Due to this small deformation step, the ground state can be found to be very close to the real ones obtained by unconstrained calculations.

Figures 2–5 show the potential energy curves (PECs) for even–even isotopes of Mg, Si, S, and Ar, respectively. The energies are normalized with respect to the total energy of the absolute minima. Figure 2 presents the PECs for Mg isotopic chain which starts from $N = 8$ shell closure. The deformed shapes are seen to evolve between the shell closures. In Fig. 2, the potential energy curve for ^{20}Mg has a spherical shape which is expected for magic neutron number $N = 8$. A sudden shape transition from spherical to prolate is observed as one moves from ^{20}Mg to ^{22}Mg. A large prolate deformation minimum ($\beta_2 = 0.5$) is seen for ^{22,24}Mg nuclei. The shape becomes oblate for ^{26}Mg and a spherical shape is restored for ^{32}Mg due to $N = 20$ shell closure. On moving towards the more neutron-rich side, a prolate min-

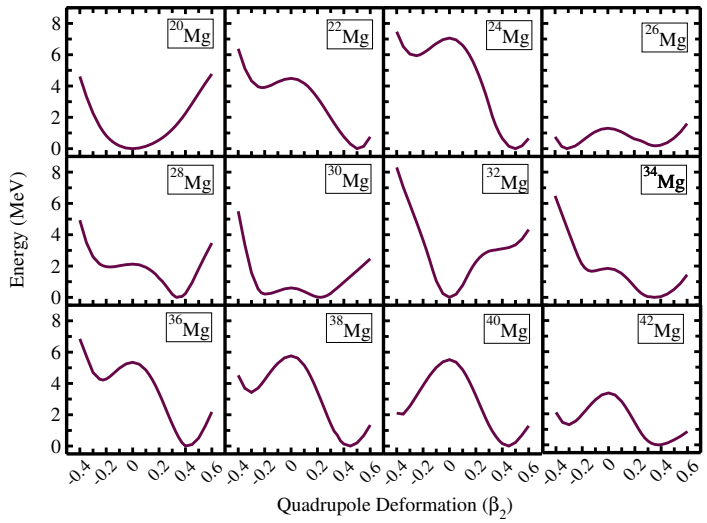

Fig. 2. The potential energy curves (PECs), calculated using the RHB model, as a function of the quadrupole deformation parameter, β_2, for Mg isotopes. For each nuclei, the energies are normalized with respect to the binding energy of the absolute minima.

imum is seen for $^{34-40}$Mg isotopes with quadrupole deformation between $\beta_2 \approx 0.35$–0.45. An oblate–prolate shape coexistence is also observed for ^{26}Mg and ^{30}Mg isotopes.

The PECs for the even–even isotopes of Si are shown in Fig. 3. It can be observed that most of the Si isotopes favor an oblate shape minimum on moving away from $N = 8$ shell closure. ^{26}Si have a ground-state prolate minimum with quadrupole deformation $\beta_2 = 0.40$ coexisting with an almost degenerate oblate minima with $\beta_2 = 0.30$. In addition to this, the isotopes ^{24}Si, ^{26}Si, ^{30}Si, ^{38}Si and ^{40}Si show the phenomena of shape coexistence. The study of shape evolution for S isotopic chain starts from ^{26}S ($Z = 16$,

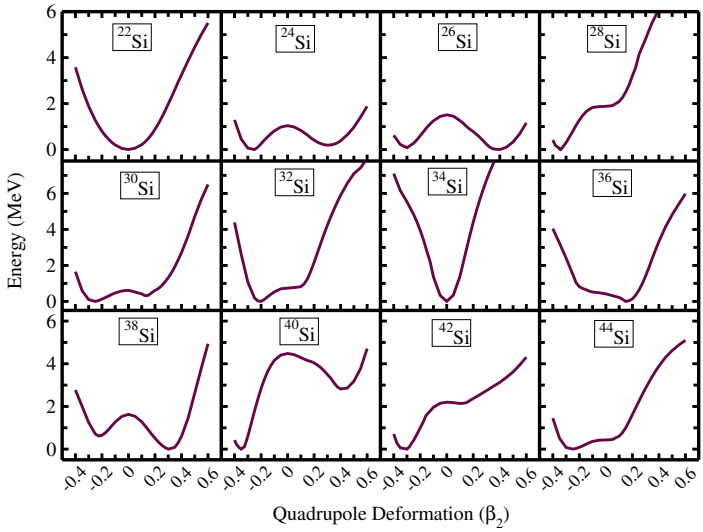

Fig. 3. The same as described in the caption of Fig. 2 but for Si isotopes.

$N = 10$) which exhibits very small prolate deformation. A sudden rise in the quadrupole deformation parameter is observed on moving from ^{26}S to ^{28}S, see Fig. 4. It is interesting to observe a staggering behavior of β_2 on moving towards $N = 20$ shell closure. The sign of the deformation parameter changes in each step with an increase in neutron number. A spherical shape is observed for ^{36}S as expected due to the magic neutron number, $N = 20$. The potential energy curves show a prolate ground-state minimum from $^{38-46}$S isotopes. The shape again becomes oblate for $^{48-52}$S isotopes. It is worth to note that the ground state the minimum for ^{56}S is spherical in the potential energy curve supporting the presence of $N = 40$ sub-shell closure. In addition to these shape transitions, an oblate–prolate shape coexistence is also seen for many sulfur isotopes. Figure 5 presents the PECs for Ar isotopic chain. The chain of isotopic study starts from $Z = 10$

and terminates at $N = 40$. It can be observed from the figure that most of the Ar isotopes are oblate in their ground state. A spherical ground-state shape is observed for nuclei with neutron numbers $N = 20$ and $N = 40$.

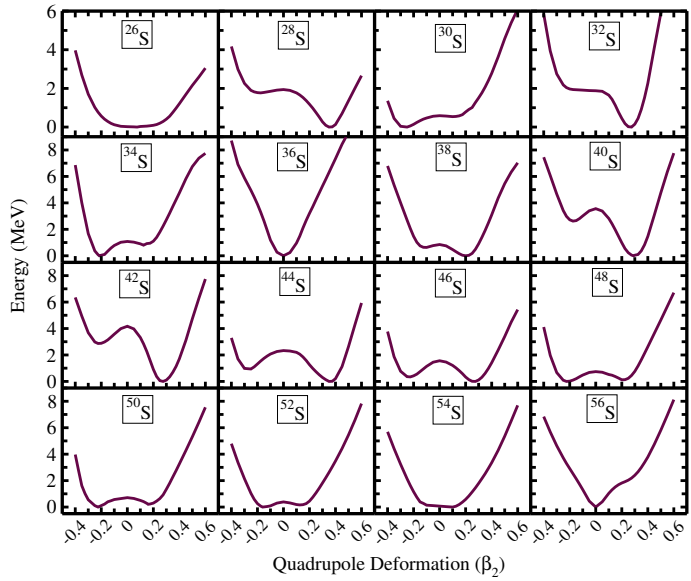

Fig. 4. The same as described in the caption of Fig. 2 but for S isotopes.

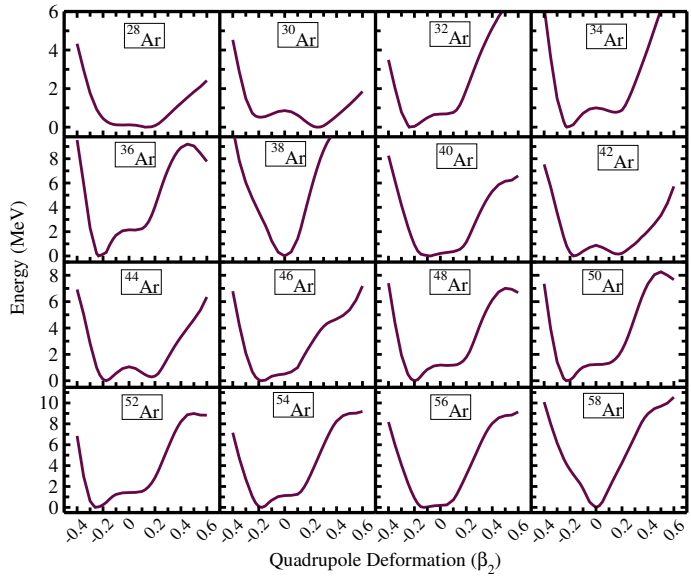

Fig. 5. The same as described in the caption of Fig. 2 but for Ar isotopes.

It should be noted that some of the shape coexisting nuclei with axial deformation might correspond to a triaxial ground state. However, to investigate it, one has to consider the triaxial degree of freedom in the calculations. The RMF approach with triaxiality was firstly developed by Koepf and Ring [51]. The beyond-RMF study done by Yao *et al.* [52] found the triaxial ground state for ^{26}Mg. In the Gogny-HFB calculations, a considerable triaxial ground-state deformation is observed for ^{24}Si and ^{44}Ar [53]. A recent study of light nuclei by Wang *et al.* [54] found a triaxial ground state in shape-coexisting nuclei ^{38}Si, ^{46}S and ^{48}S. However, their results indicate that the triaxiality effect on the mean-field part of nuclear binding energy in these nuclei is marginal.

In Figs. 2–5, the disappearance of $N = 28$ shell closure is also observed. The $N = 28$ isotones, ^{40}Mg, ^{42}Si, ^{44}S, and ^{46}Ar, have some finite deformations indicating the disappearance of $N = 28$ shell closure. An interesting case of study is seen for ^{44}S (an isotone of $N = 28$) which shows an oblate–prolate shape coexistence. This observation is in agreement with the experimental observation [55, 56] and with the predictions of various theoretical results [12–14].

The overall calculated results of binding energies, quadrupole deformation parameter, and charge radii for even–even isotopes of Mg, Si, S, and Ar nuclei are summarized in Tables I–IV. These results are calculated using axially constrained RHB calculations with pairing force which is separable in momentum space. The findings of nuclear observables with DD-ME2 interaction are compared with the results of the HFB model with D1S-Gogny interaction [53] and with the available experimental data [57–60]. The use of different interactions between the nucleons leads to the variation in the ground-state shapes in the two models. The study of nuclear drip lines is itself a very broad and interesting area. Different theoretical models have remarkably divergent predictions about neutron drip lines [61]. Considering the case of Mg isotopes, different neutron drip line predictions have been proposed. According to the study done in Ref. [62], the heaviest magnesium isotope observed is ^{40}Mg, while the drip line is found at ^{42}Mg in some recent studies [63, 64]. A recent study done using the deformed RHB theory in continuum predicts ^{46}Mg as a drip-line nucleus [65]. In our present study, the neutron drip line in Mg isotopic chain is predicted for the ^{40}Mg nucleus subjected to a negative value of two-neutron separation energy ($S_{2n}(Z,N) = E_{\rm b}(Z,N) - E_{\rm b}(Z,N-2)$) for ^{42}Mg. In terms of the chemical potential (λ_n), the separation energy can be written as $S_{2n} \approx -2\lambda_n$ [61]. A positive value of λ_n ($= 0.6293$) for ^{42}Mg results in the negative value of S_{2n}, leading to an unbound system. On the proton-rich side, the stability of a nuclei can be investigated by calculating two-proton separation energy ($S_{2p}(Z,N) = E_{\rm b}(Z,N) - E_{\rm b}(Z-2,N)$). The negative values of S_{2p}

for ^{22}Si,^{26}S, ^{28}Ar and for ^{30}Ar nuclei indicate these systems to be unstable/unbound to the proton emission. Nuclei with small values of S_{2n} and S_{2p} exhibit the characteristics of a somewhat loosely bound system. It can be observed that the neutron-rich nuclei ^{56}S, in the sulfur isotopic chain, have a very low value of two-neutron separation energy (S_{2n}) leading to an unbound system.

TABLE I

The binding energy (in MeV), the quadrupole deformation parameter β_2, and root-mean-square charge radii $R_{\rm ch}$ for the ground states and a few intrinsic excited states of $^{20-42}$Mg isotopes compared with that of D1S-Gogny [53] and with available experimental data [57–60].

^{42}Mg	261.08	0.375	3.293						

The stability of a nucleus is directly related to its binding energy and is also an important quantity to test a parameter set. The r.m.s. deviation of binding energies and charge radii is defined as

$$(\sigma_{\rm rms})_{\rm BE} = \sqrt{\sum_{i=1}^{n} \frac{\left(E_i^{\rm Exp} - E_i^{\rm Cal}\right)^2}{n}},$$
$$(\sigma_{\rm rms})_{R_{\rm ch}} = \sqrt{\sum_{i=1}^{n} \frac{\left(R_i^{\rm Exp} - R_i^{\rm Cal}\right)^2}{n}}, \tag{20}$$

where n is the number of nuclei for which the r.m.s. deviation is calculated. The r.m.s. deviations of binding energy for these nuclei with DD-ME2 parameter set are 3.0006 MeV, 3.7455 MeV, 3.8978 MeV, and 3.2174 MeV for Mg, Si, S, and Ar isotopic chain, respectively. It can be observed from

Tables I–IV that there are only a few experimental data, for charge radii, available for Mg, Si, and S isotopes which would not be sufficient to calculate the r.m.s. deviation of charge radii ($(\sigma_{\rm rms})_{R_{\rm ch}}$). However, the value of $(\sigma_{\rm rms})_{R_{\rm ch}}$ for Ar isotopic chain is 0.0211 fm. The values of r.m.s. deviations of binding energy and charge radii are found to be comparable to the D1S-Gogny force.

In the PECs of these isotopic chains, a sudden shape transition is observed. Mainly, the Mg and Si isotopes show a sudden rise in deformation with the addition of neutrons. The origin of deformations is related to the evolution of the shell structure of single-particle orbitals. The nuclei with a magic number of nucleons (neutron or/and proton) form a closed shell which implies a spherical shape. However, this picture of spherical shape gets altered if the single-particle orbits are partially filled or by the excitation of nucleons to higher orbitals. To throw some light on the phenomena of nuclear deformation, we have shown, in Fig. 6, the neutron and proton single-particle energy levels for ^{20}Mg and ^{22}Mg. According to Jahn–Teller effect [66], the regions of low-level density around the Fermi surface favor the onset of deformation and are related to the ground-state minima in the potential energy curves. The upper two panels of Fig. 6 show single neu-

tron and proton levels corresponding to spherical configuration with $\beta_2 = 0$ for the ^{20}Mg nucleus. A large gap between the last occupied ($1p_{1/2}$) and the first unoccupied ($1d_{5/2}$) neutron orbits is observed. The ^{20}Mg nucleus has a neutron shell closure at $N = 8$. All neutron orbits below the Fermi level are occupied which leads to a spherical shape. The lower two panels of Fig. 6 present the neutron and proton single-particle energy levels in the ^{22}Mg nucleus as functions of the axial deformation parameter β_2. The solid curves present levels with positive parity and dashed curves denote levels with negative parity. Fermi levels are denoted by a thick black line. A large shell gap with $0.50 \leq \beta_2 \leq 0.55$ is observed around the Fermi level in the plots of single-particle energies for neutron and proton, respectively. The proton shell gap, however, is more pronounced than the neutron shell gap favoring the minima in the PEC of ^{22}Mg. This large proton shell gap is mainly formed by two levels split from the degenerate $1\pi d_{5/2}$ state favoring

the deformation, *i.e.*, the filling of [220]1/2 and [211]3/2 orbitals of $1d_{5/2}$ sub-shell, which are downsloping. However, the filling of [202]5/2 orbital of $1d_{5/2}$ sub-shell leads to a decrease in deformation due to its upsloping character. This decrease in deformation can be observed for the ^{26}Mg nucleus. Further, moving along the Mg isotopic chain, the deformation increases due to the mixing or special superpositions of single-particle states. The same can be said for Si isotopes. Thus, these ideas propose a simple comprehension of the several mechanisms leading to deformation in these isotopic chains.

In Fig. 7, the isotopic evolution of deformation parameter β_2 as a function of neutron number, N, is shown for all the isotopes of Mg, Si, S, and Ar. The comparison of the calculated values of the deformation parameter is done with the finite range droplet model (FRDM) and with available experimental data. In this figure, the progress of deformations with the neutron number, which is already seen in Figs. 2–5, is more apparent. In the Mg isotopic chain, all isotopes except ^{26}Mg have been shown to possess a prolate shape. The ^{20}Mg and ^{32}Mg nuclei have spherical shapes due

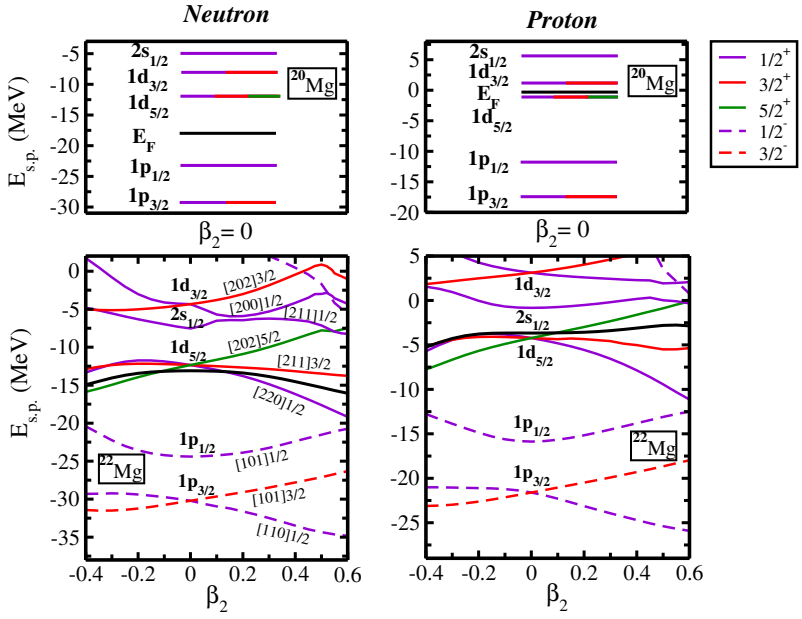

Fig. 6. Neutron and proton single-particle energy levels for ^{20}Mg and ^{22}Mg.

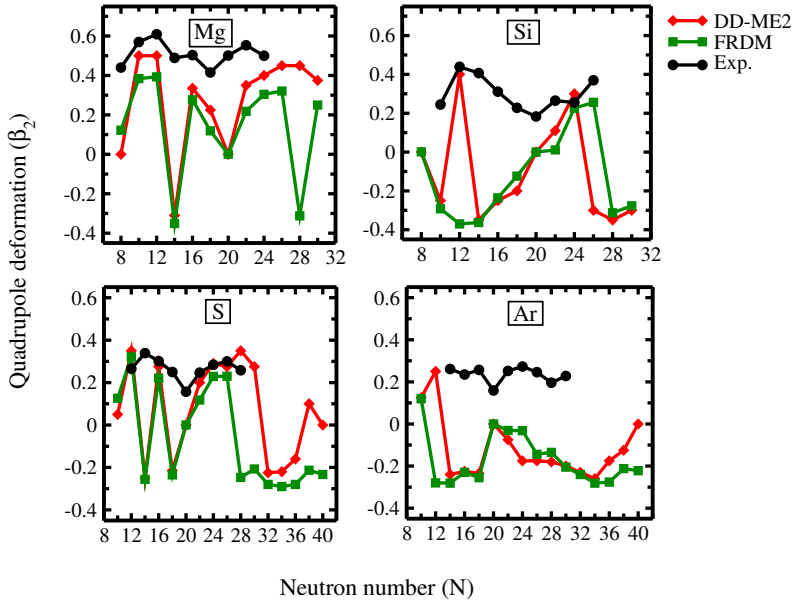

Fig. 7. The quadrupole deformation parameter (β_2) with respect to neutron number is plotted for Mg, Si, S and Ar isotopes. The comparison is made with FRDM data.

to the presence of $N = 8$ and $N = 20$ shell closures, respectively. Large prolate deformation is observed as one moves away from $N = 8$ shell closure. The nuclei above $N = 20$ shell closure also show a significant large deformation ($\beta_2 \sim 0.4$). It has been also noted that the Mg isotope with $N = 28$ shell closure takes a very large deformation ($\beta_2 \sim 0.45$), forced by a neutron mean-field, indicating the disappearance of shell closure and shell effect at $N = 28$. The Si isotopes are predicted to have large prolate as well as oblate deformations near the proton- and neutron-rich side. The disappearance of $N = 28$ shell closure is also visible in ^{42}Si, as it has a significant oblate deformation ($\beta_2 = -0.35$). A variety of shape transitions is seen throughout the S isotopic chain. A staggering type behavior of deformation parameter is observed up to $N = 20$ shell closure, indicating the softness of these isotopes. A large prolate deformation is observed on moving towards neutron-rich side which further becomes small on approaching neutron subshell closure at $N = 40$. Most of the Ar isotopes are seen to have an oblate ground state with a spherical shape at $N = 20$ shell closure and $N = 40$ sub-shell closure. The predictions of deformations in these isotopic chains are found to be in good agreement with that of the finite range droplet model and with experimental data.

In Fig. 8, we have presented the nuclei exhibiting the shape coexistence using the RHB model with DD-ME2 interaction. On the vertical axis, the energy difference between the prolate minima and oblate minima is shown. A positive value of ΔE implies that the prolate minima are more pronounced

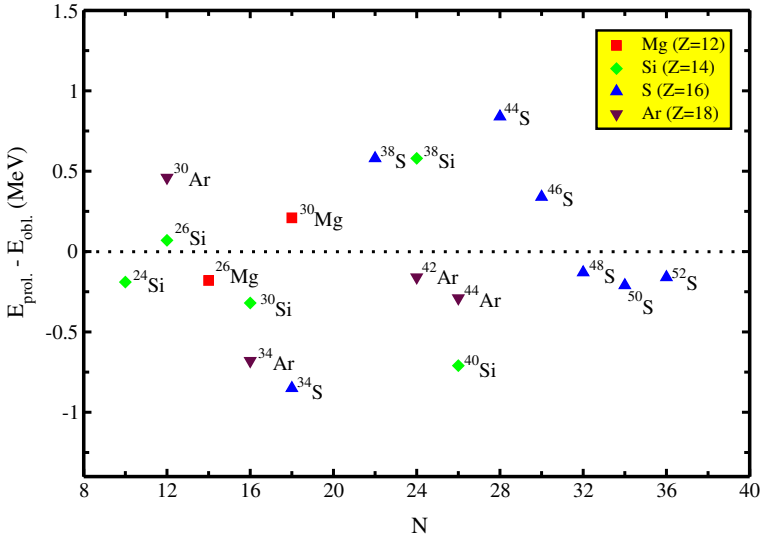

Fig. 8. The energy difference between prolate and oblate minima is plotted for shape coexisting candidates of Mg, Si, S and Ar isotopes.

than the oblate minima, while a negative value indicates that the oblate minima are deepest than the corresponding prolate minima. In the Mg chain presented here, the prolate shape is the lowest energy state. However, the ^{26}Mg and ^{30}Mg isotopes exhibit shape coexistence with $|\Delta E| = 0.2$ MeV. Many Si isotopes also show the shape coexistence phenomenon. The nuclei ^{24}Si, ^{26}Si, ^{30}Si, ^{38}Si, and ^{40}Si have almost degenerate prolate and oblate minima. Except for ^{26}Si and ^{38}Si, the other Si isotopes are oblate in the lowest energy state coexisting with a prolate minimum. Several isotopes of S that show the shape coexistence are: ^{34}S, ^{38}S, ^{44}S, ^{46}S, ^{48}S, ^{50}S, and ^{52}S. The positive value of ΔE for ^{38}S, ^{44}S, and ^{46}S indicates the prolate ground state for these nuclei. On the other hand, a negative value of ΔE for ^{34}S, ^{48}S, ^{50}S, and ^{52}S implies the oblate ground state. The value of ΔE is found to be very small for the ^{48}S, ^{50}S, and ^{52}S nuclei indicating the softness of these nuclei. Finally, the ^{30}Ar, ^{34}Ar, ^{42}Ar, and ^{44}Ar nuclei have also been found to be shape coexisting nuclei in the Ar isotopic chain. Except for ^{30}Ar, other nuclei have the oblate ground state coexisting with prolate minima a few keV above the lowest minima.

Figure 9 presents the isotope shifts for Mg, Si, S and Ar isotopic chains. The isotope shift for each isotopic chain is calculated relative to the mean-square nuclear charge radii of the reference nuclei with $N = 20$, given as

$$\delta \left\langle r_{\mathrm{ch}}^2 \right\rangle^{20,N} = \left\langle r_{\mathrm{ch}}^2 \right\rangle^{N} - \left\langle r_c^2 \right\rangle^{20} , \tag{21}$$

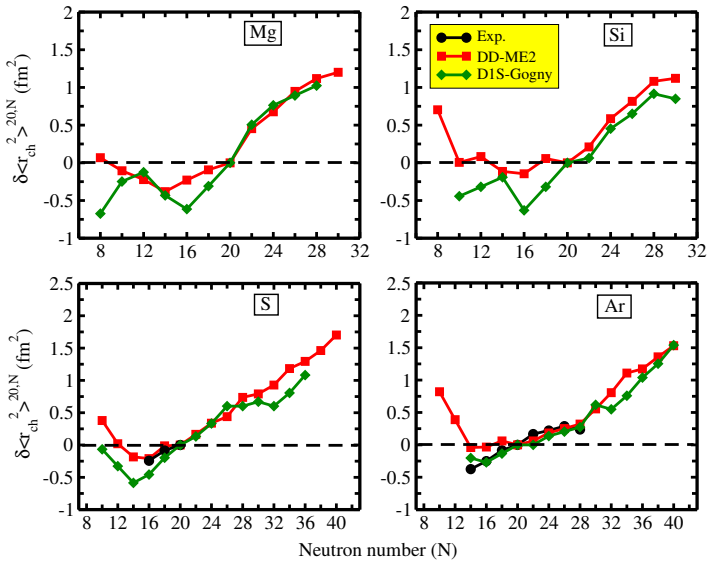

Fig. 9. Isotope shift for Mg, Si, S and Ar isotopes, calculated using the RHB model are compared with results of D1S-Gogny [53] and with experimental data [60].

where $\langle r^2_{\rm ch}\rangle$ is the mean-square charge radii of nuclei calculated from charge radius ($R_{\rm ch}$) given in Tables I–IV. A parabola like behavior of isotope shifts is observed for all isotopic chains. The minima in the isotope shifts correspond to nuclei near the stability line. In Fig. 9, the ^{26}Mg, ^{30}Si, ^{32}S and ^{34}Ar nuclei show the minima in the isotope shifts. Moreover, these nuclei have smaller charge radii even as compared to the lighter neighbors. The isotope shift is observed to rise considerably towards the proton-rich side. This rise in isotope shift to the extreme left or towards the proton-rich side indicates the swelling of charge radius due to large proton skin. The trend of isotope shifts, in the present study, is compared with the results of HFB calculations using the D1S-Gogny force and with available experimental data.

3.2. Single-particle energy spectra of $N = 28$ isotones

The emergence of collectivity and shape coexistence phenomenon in the nuclei can be understood by the evolution of neutron and proton single-particle energy levels with quadrupole deformation and the occurrence of gaps around the Fermi level. The regions of low-level density favor the onset of deformation as explained in the Jahn–Teller effect [66]. The ground-state minima in the potential energy curve are associated with the effect of low-level density around the Fermi surface. The feature of deformation occurrence in the $N = 28$ isotones can be ascribed to the possibility of quadrupole correlations between the occupied and valence states.

Figures 10–13 present the neutron and proton single-particle energy levels for $N = 28$ isotones, calculated using the RHB model with DD-ME2 interaction. The increase in neutron $N = 28$ shell gap [55] and the near degeneracy of the $d_{3/2}$ and $s_{1/2}$ proton orbitals can be seen in these figures. In Fig. 10, the gap between occupied and unoccupied neutron levels is around $\beta_2 \approx -0.37$ favoring an oblate shape, while on the proton side, this gap is around $\beta_2 \approx 0.44$ which favors the onset of prolate deformation. The proton shell gap is more pronounced than the neutron gap leading to the prolate ground state of ^{40}Mg. The picture of magic nucleus [67] in ^{42}Si seems to be broken, in Fig. 11, as a large neutron and proton shell gaps are observed on the oblate side which results in the pronounced oblate minimum at $\beta_2 \approx -0.35$. In ^{44}S, the largest gap between neutron states is around $\beta_2 \approx -0.30$, that is, on the oblate side (left panel of Fig. 12). In the proton energy level spectra, the largest gap is found on the prolate side with deformation around $\beta_2 \approx 0.35$ (right panel of Fig. 12). The formation of the oblate neutron and prolate proton shell gaps is the origin of the coexistence of deformed shapes in ^{44}S (*cf.* Fig. 4). Finally, a large spherical gap is observed between occupied and unoccupied neutron levels, as shown in the left panel of Fig. 13. For proton states, the largest gap is observed around

$-0.23 \leq \beta_2 \leq -0.17$, that is, on the oblate side. The competition between the spherical shape favored by neutron states and the oblate shape favored by proton states leads to the shallow extended oblate minimum shown in Fig. 5.

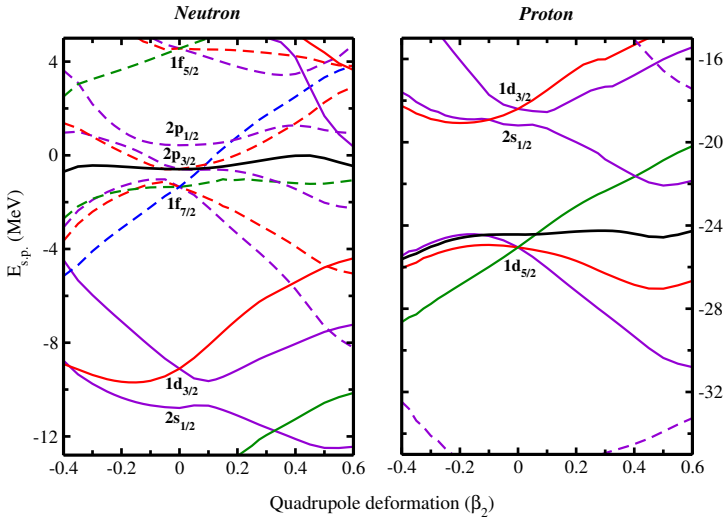

Fig. 10. Neutron and proton single-particle energy levels of ^{40}Mg as a function of quadrupole deformation parameter β_2. Solid curves present levels with positive parity, and dashed curves denote levels with negative parity. The thick black line denotes the corresponding Fermi energy levels.

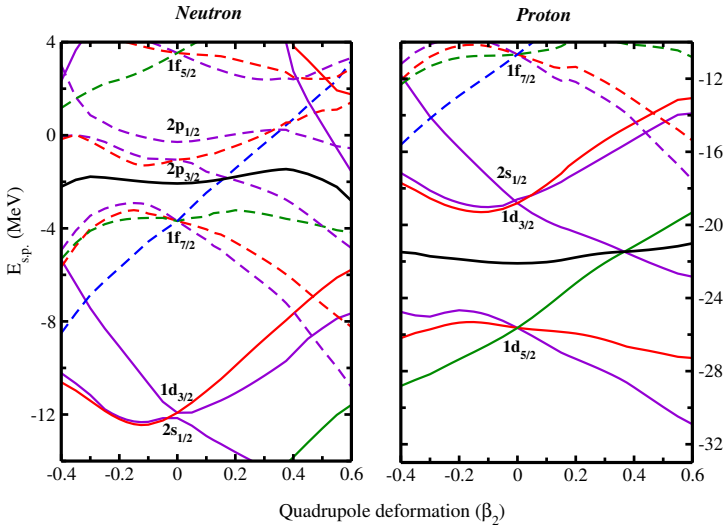

Fig. 11. The same as described in the caption of Fig. 10 but for the ^{42}Si nucleus.

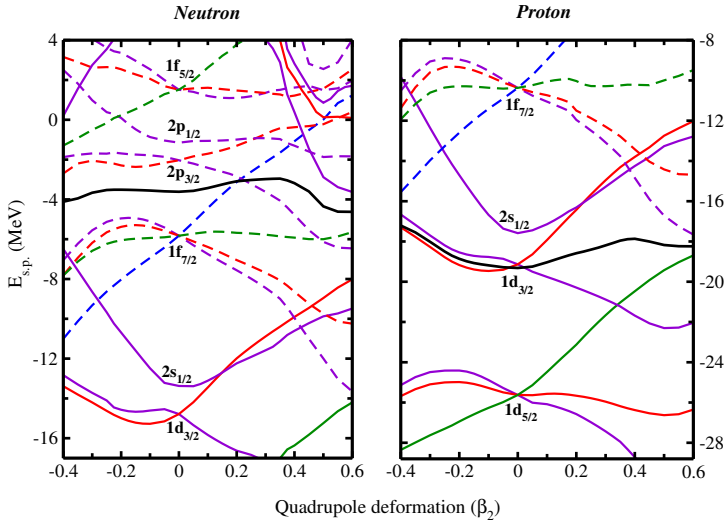

Fig. 12. The same as described in the caption of Fig. 10 but for the ^{44}S nucleus.

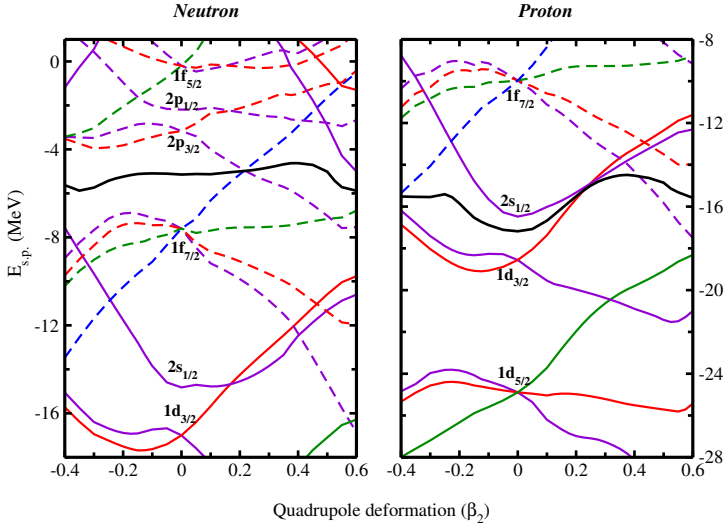

Fig. 13. The same as described in the caption of Fig. 10 but for the ^{46}Ar nucleus.

In Table V, the theoretically calculated neutron $N = 28$ spherical shell gaps, and the corresponding quadrupole deformation parameter for the minima of potential energy curves of ^{40}Mg, ^{42}Si, ^{44}S, ^{46}Ar, and ^{48}Ca are shown. A clear reduction of the spherical $N = 28$ shell gap is seen as one moves towards the proton-deficient side. It can be observed from Table V that the spherical gap between doubly magic ^{48}Ca and ^{46}Ar decreases from 4.8706

to 4.4351 MeV, which is in good agreement with experimental data [56, 68]. The theory and experiment, both points toward a strong disruption of the $N = 28$ spherical gaps as the isotones become more neutron-rich. It was shown in the RHB study of neutron-rich $N = 28$ isotones that the relativistic mean-field model reproduces the $N = 28$ shell gap due to the inclusion of the spin-orbit interaction and the isospin dependence of this term [22]. The removal of protons from a nucleus stimulates the energy change of the neutron levels due to the proton–neutron interaction. Experimentally, indirect evidence of the erosion of the gap has been obtained by following the evolution of excitation energies of the 2_1^+ state and the E2 transitions in $N = 28$ isotones and neighboring nuclei [55, 56]. The present findings of erosion of $N = 28$ shell gap in light nuclei are consistent with the results of RHB calculations with density-dependent point coupling (DD-PC1) interaction [12] and with other theoretical models.

TABLE V

Theoretically calculated neutron $N = 28$ spherical energy gaps, and the corresponding values of ground-state minima of the quadrupole binding energy maps of ^{40}Mg, ^{42}Si, ^{44}S, ^{46}Ar, and ^{48}Ca.

^{48}Ca	4.8706	0.0

4. Conclusion

In the present work, we have done self-consistent calculations using the relativistic Hartree–Bogoliubov (RHB) model with density-dependent meson exchange (DD-ME2) interaction. The pairing correlations have been taken into account by employing an interaction that is separable in momentum space. An extensive study of shape evolution and other ground-state properties has been done for Mg, Si, S, and Ar isotopic chains by taking axial symmetry into account. The study has covered complete isotopic chains from proton-rich side to neutron-rich side. The PECs gives a clear picture of shape evolution and shape transition for even–even isotopes of Mg, Si, S, and Ar. A sudden shape transition and large deformation are observed for these isotopic chains even near the nuclear drip lines. A positive value of chemical potential (λ_n) and negative value of two-neutron separation energy (S_{2n}) is predicted for ^{40}Mg which indicates a neutron drip line nucleus. Our

calculations also indicate the drip line for ^{56}S due to a very small value of S_{2n}. In the present work, the proton drip line is observed for the ^{24}Si, ^{28}S, and for ^{32}Ar nucleus in these chains. Some isotopes of Mg, Si, S, and Ar isotopic chains are seen to exhibit well-deformed oblate–prolate shape coexistence with an energy difference of a few keV. A strong shell effect has been observed in these isotopic chains as the nuclei with the magic number of neutrons, $N = 8$ and 20, show a spherical shape. The ^{56}S and ^{58}Ar nuclei are observed to be spherical in their ground state indicating the presence of $N = 40$ sub-shell closure. However, the shell effects are washed out for the $N = 28$ magic number, as it shows different properties. It has been observed from the present study that the isotones of $N = 28$ magic number show a well-deformed minimum rather than spherical minima. The reduction of neutron shell gap between ^{48}Ca and ^{40}Mg favors the occurrence of particle–hole excitations between the occupied and valance orbits. An interesting case of ^{44}S nuclei is studied as this nucleus with $N = 28$ shows a strong prolate- and oblate-shape minima coexisting in the ground state. In conclusion, we can say that the deformation effect cannot be neglected in the structural characterization of light nuclei.

The authors are thankful to the Himachal Pradesh University for providing computational facilities. One of the authors, Pankaj Kumar, acknowledges the financial assistance Senior Research Fellowship provided by the Council of Scientific and Industrial Research (CSIR), New Delhi *vide* reference No. 09/237(0165)/2018-EMR-I. The authors would like to express deep and sincere gratitude to Prof. Peter Ring for a fruitful discussion.

Abstract

In the present work we have studied the shape evolution and ground state properties like binding energies, shell closure parameter, neutron separation energies, nuclear size and neutron skin thickness in the even-even isotopes of Zirconium, Molybdenum and Ruthenium. Our theoretical results are compared with the available experimental data as well as theoretical extractions. The theoretical calculations are done by using the well known density dependent meson exchange model DD-ME2 and density dependent point coupling models DD-PC1 and DD-PCX.

Introduction

The ground states of Zr, Mo and Ru isotopes are weakly deformed for neutron number ranging from N = 50 - 60, but as N = 60 is approached and crossed they undergo strong shape transitions from nearly spherical to well deformed prolate or oblate deformations. The evidence for these shape variation includes the 2^+ lifetime measurements [1] and the presence of triaxiality in Mo isotopes have also been identified [2] from spectroscopic studies of high-spin states. The heavier isotopes of Zr nuclei around $A \sim 100$ show axially symmetric well deformed shape. It has been suggested that above this region the N = 82 shell closure might be quenched away from stability which is predicted by many models [3], but the experimental evidences found are still weak. To explore the structural evolution in the nuclei far from the valley of stability, nuclear binding energies and charge radii are considered to be most sensitive observables. The presence discontinuities in the systematics of a particular mass region and the abrupt change in root-mean-square (rms) radius of the charge distributions indicate the structural changes related to the nuclear deformation.

Many theoretical models like the self-consistent mean-field models with the Skyrme and the Gogny force [4], [5], [6], [7], relativistic mean-field (RMF) model [8], [9], [10], [11] and the IBM (interacting boson model) [12], [13] are used to understand the evolution of structure in these nuclei. The nuclear density functional theories are used to understand nuclear many-body dynamics for an appreciable description of the nuclei near drip lines [14], [15], [16], [17], [18], [19], [20]. Recently, a dual-shell mechanism for the phenomenon of shape coexistence is introduced which include all mass regions [21], which predicts that shape coexistence cannot appear everywhere on nuclear chart, but only within the islands of shape coexistence whose limits are determined through group theoretical arguments without any free parameters.

In the present work, we present a systematic study of shape transition and ground state properties such as binding energies, shell closures (D_n), two neutron separation energies (S_{2n}), differential variation in two neutron separation energies (dS_{2n}), nuclear root mean square radius (R_{rms}), nuclear charge radius (R_c), neutron skin thickness (Δr_{np}) for even-even isotopes of Zr, Mo and Ru. The theoretical calculations carried out within the framework of Relativistic Hartree Bogoliubov model using code DIRHB [22] by employing the density independent Relativistic Nuclear Density Functional (RMF-NDF) based on Meson Exchange model parameters DD-ME2 [23] and Point Coupling model parameters DD-PC1 [24] and DD-PCX [25] with a separable pairing interaction [26]. The calculations are performed by taking axial symmetry in account and the deformation ranges from -0.4 to 0.4 for each system. The number of oscillator shells (number of fermions and number of bosons) are taken to be 12 and center of mass correction is $E_{cm} = -P_{cm}^2/2Am$; P_{cm} is the total momentum of the nucleus with A nucleons. Separable pairing interaction

MeVfm^3 and pairing width is taken to be a=0.644 fm in the p-p channel of Relativistic Hartree Bogoliubov

model.

This paper is organized as follows: An outline of the relativistic self-consistent mean field models is presented in section 2. Results and discussions for the potential energy curves, size of the nucleus, rms radius, charge radii, neutron skin thickness for various isotopes. Lastly, the conclusions drawn from our present studies are presented in section 4.

Section snippets

Theoretical framework

Self-consistent mean-field (SCMF) models provide a noteworthy tool to study nuclear structure properties throughout the nuclear chart. The models are based on nuclear energy density functionals which provide an accurate description of ground state properties of atomic nuclei ranging from relatively light mass to superheavy systems, and also from the valley of β-stability to the particle drip-lines. A particular class of SCMF structure models which is based on relativistic (covariant) energy…

Potential energy curves

Shape is one of the most fundamental properties of nuclei and quadrupole deformation parameter β_2 reflects the shape of the nuclei. The potential energy surfaces obtained from self-consistent relativistic mean-field model give promising results for ground state like non-relativistic theory [30]. Fig. 1, Fig. 2, Fig. 3, Fig. 4, Fig. 5, Fig. 6, Fig. 7, Fig. 8, Fig. 9 present the potential energy surface as a function of β_2 in the isotopes of Zr, Mo and Ru nuclei. The ground state of a system is…

Conclusions

In the present research work, we have theoretically computed the potential energy surfaces and ground state properties of even-even isotopes of Zr, Mo and Ru using Relativistic nuclear density functional based on Meson Exchange model parameters DD-ME2 and Point Coupling model parameters DD-PC1 and DD-PCX. The results obtained from the theoretical calculations are compared with the experimental data, wherever available and theoretical results complements experimental data reasonably well.

Abstract

In this paper, we have examined the nuclear structural properties of $^{190–210}$Au isotopes within the framework of the Hartree–Fock–Bogoliubov Model. For the theoretical calculations, we have used the UNEDF2 and SKP interactions. The studies include the shape evolution, quadrupole deformation parameter β_2, nuclear electric quadrupole moment Q(b), single-particle energy levels, the binding energy per nucleon, nuclear charge radius, neutron rms radius, proton rms radius and neutron skin thickness. To analyze the accuracy of our theoretical results, we have presented the comparative analysis with experimental data and finite-range droplet model calculations. The adequate resemblance with experimental data is supporting our studies. We observe the oblate-prolate shape coexistence for ^{190}Au, ^{193}Au and ^{195}Au using the UNEDF2 interaction.

Keywords: Hartree–Fock–Bogoliubov theory ▪ quadrupole deformation ▪ nuclear electric quadrupole moment ▪ single-particle energy levels ▪ binding energy per nucleon ▪ charge radius ▪ neutron skin thickness

Abstract

The nuclei with a depressed central nucleonic density (bubble nuclei) are studied. The relativistic Hartree-Bogoliubov model with density-dependent meson-exchange interaction has been used to explore the possibility of deformed dual bubble-like structures in light nuclei, which are experimentally accessible. In dual bubble nuclei, the central densities for both proton and neutron deplete simultaneously. The unoccupancy of low angular momentum states for proton and neutron orbitals plays a vital role in the formation of bubble structures. We find favorable candidates around N or/and $Z = 14$ exhibiting a deformed dual bubble-like structure.

ABSTRACT

We have employed the relativistic Hartree-Bogoliubov (RHB) model with density-dependent meson-exchange interaction and separable pairing to investigate neutron dripline mechanisms for heavy Mg isotopes. In the present study, ^{40}Mg is predicted to be dripline nuclei. The calculations are carried out by taking axial deformation into account. An investigation of shape transition is also done for even-even $^{32\text{-}42}$Mg isotopes. Our prediction for neutron dripline for ^{40}Mg is consistent with some recent studies.

Abstract

The phenomena of shape evolution and shape coexistence are studied in even–even 86-134Pd isotopes by employing the relativistic Hartree–Bogoliubov (RHB) model by employing density-dependent point-coupling parameter sets DD-PC1 and DD-PCX with separable pairing interaction. Our findings of binding energies, quadrupole deformation parameter, charge radii, and two-neutron separation energies as a function of neutron number N are compared with available experimental data and various theoretical models. Our theoretical results predict prolate-oblate shape coexistence in 108Pd isotope.

The phenomena of shape evolution and shape coexistence are studied in even–even $^{86-134}$Pd isotopes by employing the relativistic Hartree–Bogoliubov (RHB) model by employing density-dependent point-coupling parameter sets DD-PC1 and DD-PCX with separable pairing interaction. Our findings of binding energies, quadrupole deformation parameter, charge radii, and two-neutron separation energies as a function of neutron number N are compared with available experimental data and various theoretical models. Our theoretical results predict prolate–oblate shape coexistence in ^{108}Pd isotope.

DOI:10.5506/APhysPolB.52.1433

1. Intoduction

It is known that nuclei lying near shell closure $Z = 50$ exhibit shape transitions and shape coexistence [1, 2] with the increase in neutron number. Radioactive Ion Beam (RIB) facilities and sensitive detection technologies have opened new possibilities to study the structure and properties of various exotic nuclei. The nuclei in this mass region exhibit a rapid change of nuclear shapes with competing spherical, axially symmetric prolate and oblate, and triaxial shapes, resulting in shape instabilities and coexistence of nuclear shape transitions in isotopic chains [3]. In addition to structural richness, another interesting characteristics of this region is its involvement in the astrophysical rapid neutron capture process (also called r-process), one of the main nucleosynthesis mechanisms which leads to the production of heavy neutron-rich nuclei in the universe [4, 5].

Abstract

Nanocrystalline cadmium and indium substituted barium M-type hexagonal ferrite-based nanomaterials were prepared via sol-gel auto-combustion technique for studying the electrical, dielectric and conductivity characteristics of prepared samples such as dc resistivity, dielectric constant (ε'), dielectric loss (tan δ) and ac conductivity (σ_{ac}) with the usage of different characterizing techniques like keithley 2611 two probe system and impedance analyzer. The room temperature dc resistivity of synthesized samples increases for lower concentrations i.e. x=0.1 of Cd^{2+}/In^{3+} but for the higher concentrations i.e. x=0.2, it starts decreasing consequently. The temperature dependent dc resistivity also showing a decreasing trend as a function of temperature which continuously indicating the semi-conducting behaviour of BaM hexagonal nanohexaferrites. The room temperature dielectric characteristics was investigated as a function of logarithmic frequency and it can be explained on the basis of Maxwell Wagner model and space chare polarization. From the dielectric measurements, the dielectric constant (ε') was found to be increasing with the increasing logarithmic frequency working as good energy storage material. The dielectric loss (tan δ) was found to be decreasing for the undoped sample (x=0.0) but for the undoped samples (x=0.1–0.2), it starts increasing in a very minute manner. Therefore, such materials of high increasing dielectric constant with minute values of dielectric losses make it suitable for the high frequency, energy storage and microwave devices application.

Introduction

Hexagonal ferrites are taking a lot of scientific interest by the researchers and scientists due to its various versatile properties such as superparamagnetic nature, quantum size and magnetic tunnelling effect, larger surface to volume ratio, chemical stability, non-toxic behaviour, easy to synthesize and moreover, applications in the field of energy and memory storage devices, nanoelectronics, recording media, radar and communication system, biomedicine, water purification [[1], [2], [3]]. Among the various ferrite-based

nanomaterials, nanomaterials with the hexagonal structure are called as hexaferrites represented by the chemical formula $MFe_{12}O_{19}$ (M=Ba, Sr, Pb etc.) whose crystal structure is same as that of magnetoplumbite. BaM is a type of hard ferrite based nanomaterial which is occupying technologically attention in the field of nanoscience and nanotechnology such as magnetic storage devices, recording media, microwave devices and permanent magnets due to its various properties such as high resistivity, chemical stability, high saturation magnetization, high remanent magnetization, high coercivity and low dielectric losses [4]. Now, a, days, researchers are working on various parameters in order to improve the electrical properties and to decrease the dielectric losses of synthesized specimens such as synthesis techniques, use of metallic and rare earth metal dopants, control particle and grain size, sintering and calcination temperature, chemical composition and fine powders [[5], [6], [7], [8], [9], [10], [11]]. A number of synthesis techniques were used for preparing the BaM hexagonal nano-ferrites such as sol-gel, auto-combustion, hydrothermal, co-precipitation, micro-emulsion, ceramic, ball-milling etc. out of which sol-gel auto-combustion is one of the best environment friendly method as it provides high quality magnetic nanoparticles with various properties like better distribution of nanoparticles, easy preparation and fine powders [[12], [13], [14], [15], [16], [17], [18], [19], [20]]. Jasrotia et al. (2019) synthesized a series of $Ba_{0.7}Nd_{0.3}Cd_{0.5x}In_{0.5x}Fe_{12-x}O_{19}$ (x=0.0, 0.1, 0.2, 0.3) nanohexaferrites with the usage of sol-gel auto-combustion method for reporting the structural and magnetic properties. XRD study reveals the formation of single-phase hexagonal structure with some impurity phase [21]. Yasmin et al. (2018) synthesized Gd^{3+} and Zn^{2+} doped calcium barium nanohexaferrites with the help of sol-gel auto-combustion technique for studying the structural and dielectric measurements of synthesized specimens [22]. Xu et al. (2011) synthesized Nd^{3+} substituted barium Z-type hexagonal nanomaterials by solid-state reaction for investigating different structural, dielectric and magnetic properties of prepared specimens [23]. Ashima et al. (2012) prepared Cd^{2+} and Sr^{2+} substituted Barium hexagonal nanoferrites by commercial solid-state reaction for analyzing the structural, dielectric and magnetic properties of synthesized samples [24]. Charalampos et al. (2010) synthesized dysoprium and gadolinium doped barium hexaferrite by using chemical co-precipitation method for studying its magnetic and dielectric properties in the high GHz frequency range [25]. Jasrotia et al. (2020) synthesized cadmium and indium substituted BaM nanohexaferrites having chemical composition $Ba_{0.7}Nd_{0.3}Cd_{0.5x}In_{0.5x}Fe_{12-x}O_{19}$ (x=0.0, 0.1, 0.2, 0.3) by sol-gel auto-combustion technique for studying the Raman spectrum of prepared specimens [26]. Tadjarodi et al. (2013) reported the structural, morphological, magnetic and microwave characteristics of conducting and magnetic polyaniline nanocomposites which contains nanorods and nanoparticles with a chemical composition of $Ba_{0.69}Sr_{0.17}Cd_{0.07}Zn_{0.07}Fe_{12}0_{19}$ synthesize via insitu polymerization. The present investigation showed that the synthesized composites have maximum reflection loss of 16dB make it suitable for microwave devices [27]. Saini et al. (2016) reported the structural, morphological and dielectric investigations of indium doped Ni–Zn–Cu nanosized spinel ferrites with the nominal composition Ni0.5Zn0.3Cu0.2InxFe2-xO4 (x=0.02–0.4) up to high GHz frequency range. XRD patterns showed the formation of single-phase spinel cubic structure. In the present investigation, high values of magnetic permeability (μ') with very small magnetic losses were observed. In addition to this, a miniaturization parameter equal to 12.32 and normalized impedance factor of 1.23 were calculated make it suitable as magnetic nanomaterial for miniaturized antenna application in the very high MHz frequency range [28]. In the present research work, we are using cadmium and indium as dopants in synthesizing the Ba–Nd M-type hexagonal nano-ferrites with chemical composition $Ba_{0.7}Nd_{0.3}Cd_{0.5x}In_{0.5x}Fe_{12-x}O_{19}$ (x=0.0–0.2) by sol-gel auto-combustion technique in order to observe the impact of Cd^{2+} and In^{3+} ions on the electrical and dielectric measurements of Ba–Nd hexaferrite. In this research work, a novel achievement has been found that the increase of dielectric constant with the increasing frequency which has not been found right yet and this make it suitable for the high frequency and microwave devices application.

Section snippets

Materials used

Ba–Nd M-type hexagonal ferrites of nominal composition $Ba_{0.7}Nd_{0.3}Cd_{0.5x}In_{0.5x}Fe_{12-x}O_{19}$ (x=0.0, 0.1, 0.2) were synthesized by sol-gel auto-combustion technique in which the AR graded metal nitrates such as Barium nitrate ($Ba(NO_3)_3.9H_2O$), Neodymium nitrate ($Nd(NO_3)_3.6H_2O$), Cadmium nitrate ($Cd(NO_3)_2.4H_2O$), Indium nitrate ($In(NO_3)_3.xH_2O$), Ferric nitrate ($Fe(NO_3)_3.9H_2O$) and Citric acid ($C_6H_8O_7$)) were used as starting precursors along with Ethylene glycol ($C_2H_6O_2$) as gel precursor for the…

Electrical study

Hexagonal ferrites have high values of electrical resistivity (10^{-2}-$10^{8}\Omega$cm) depending upon the number of parameters such as calcination and sintering temperature, choice of dopants, type of nanoparticle fabrication techniques. The variation of room temperature dc resistivity (log ρ) as a function of Cd^{2+}/In^{3+} concentration for the $Ba_{0.7}Nd_{0.3}Cd_{0.5x}In_{0.5x}Fe_{12-x}O_{19}$ (x=0.0, 0.1, 0.2) nanomaterials are presented in Fig. 1. The calculated values of room temperature dc resistivity (ρ) and log…

Conclusion

Form the given investigations, it was concluded that.

1. The cadmium and indium doped barium nanohexaferrites with chemical composition $Ba_{0.7}Nd_{0.3}Cd_{0.5x}In_{0.5x}Fe_{12-x}O_{19}$ (x=0.0, 0.1, 0.2) were successfully prepared by sol-gel auto-combustion technique.…

2. The room temperature dc resistivity of synthesized samples increases for lower concentrations of Cd^{2+}/In^{3+} but for the higher concentrations i.e. x=0.2, it starts decreasing consequently. The temperature dependent dc resistivity also showing a…

...The researchers and scientists pointed out that since the discovery of hexaferrites, also known as hexagonal ferrites, in the 1950s at the Philips laboratory, the demand for hexagonal ferrites has increased in the industry due to their excellent traits such as high saturation magnetization (Ms) [1], large coercivity (Hc) [2], large magnetocrystalline anisotropy (K1) [3], low-cost material [4] and high chemical stability [5]. Therefore, due to these excellent traits, the hexagonal ferrites are studied at a rapid pace for multifunctional technological applications [6] such as permanent magnets [7,8], high-density and low-density recording media [5,9], high-frequency [10], microwave devices, [11], humidity and biosensors [2,12], electromagnetic shielding, [13] etc. There are numerous factors such as crystallite size, grain size, calcination temperature and time, dopant type, site occupancy by dopants, adopted synthesis route, and many more, which could be responsible for improving the magnetic properties of hexaferrites [14]....

Abstract

In the present work, a series of Ni-doped $La_{0.7}Sr_{0.3}FeO_3$ perovskite nanostructures with chemical composition $La_{0.7}Sr_{0.3}Fe_{1-x}Ni_xO_3$ (x = 0.0, 0.01 and 0.04) were synthesized by the reverse micelle (RM) technique. The X-ray diffraction (XRD) analysis verifies good crystallinity and an orthorhombic crystal structure of the samples. The remarkable growth of the crystallites was observed in increasing the amount of Ni doping. The morphology, topography, and chemical composition were investigated through field emission scanning electron microscope (FESEM) equipped with an energy dispersive X-ray spectrometer (EDS). The FESEM/EDS measurements confirm uniform morphology and interconnected nature of the particles with relevant elements. The Fourier transform infrared (FTIR) spectra further demonstrate the perovskite structure through Fe/Ni–O asymmetric stretching and deformation of Fe/Ni–O–Fe/Ni bending vibrations in the lattice. A systematic reduction in the bandgap (E_g) is noticed upon the Ni doping in $La_{0.7}Sr_{0.3}FeO_3$, as estimated from the UV/visible spectra by employing the Tauc's relation. A distinct behaviour of dielectric properties was revealed as a function of frequency and temperature for all the samples. The dielectric constant (ε'), dielectric loss ($\tan\delta$), and ac conductivity (σ_{ac}) were measured at selected frequencies and temperatures. The results signify that the dielectric nature was frequency-dependent and thermally stimulated. The magnetic properties at room temperature indicate weak ferromagnetism with gradual increase in the maximum magnetization and coercivity with the increase in Ni concentration.

Abstract

In this work, the physical properties of nanocrystalline samples of La0.7Sr0.3Mn1-xFexO3 (0.0 ≤ x ≤0.20) perovskite manganites synthesized by the reverse micelle (RM) technique have been explored in detail. The phase purity, crystal structure and crystallite size of the samples are ensured by the X-ray diffraction (XRD) data and Fourier transform infrared (FTIR) spectroscopy. All samples are found in rhombohedral crystal structure and crystallite size increases with the increase in Fe content in La0.7Sr0.3MnO3. The scanning electron micrographs (SEM) exhibit smooth surface morphology and non-uniform shape of the particles. The optical properties are studied by UV-visible absorption spectroscopy that reveals a decrease in the absorbance and optical band gap with the increase in Fe content in La0.7Sr0.3MnO3 compound. The temperature dependent resistivity measurements reveal semiconducting nature of x = 0 and x = 0.1 samples up to studied temperature range, while a metal to insulator transition is observed at the higher doping of Fe. Magnetic studies reveal weak ferromagnetism in all the samples and a reduction in the maximum magnetization with the increase in Fe content. A close correlation between electrical transport and magnetic properties is observed with the doping of Fe ion in La0.7Sr0.3MnO3 at Mn site. These results advocate strong interactions associated with the double exchange mechanism among Fe3+ and Mn3+ ions.

... These mixed oxides show changes in their resistance due to the application of external magnetic fields (giant magnetoresistance). Additionally, this type of structure allows obtaining phases with unusual spin value, charge, crystal lattice, and orbital order, in which groupings of competing phases can coexistfor example, ferromagnetic, paramagnetic and anti-ferromagnetic phases [20] [21] [22][23]. Therefore PSMOs, given their magneto-transport properties, are creating a great deal of interest in their technological potential, with the fields of superconductivity, ferroelectricity, and thermoelectricity to the fore. ...

... Among the perovskite manganites, La 1−y Ca y MnO 3 has received enormous research attention; this is attributed to the fact that the sudden decrease of resistivity under a magnetic field and sufficiently excellent magnetoresistance (MR) make this material suitable for a variety of manganite sensors, including magnetic read-heads [9, 10] , magnetic actuators [6,11], magnetic random access memories [12,13], etc. However, the relatively low values of MR and AMR under small magnetic field hinder its practical application, and researchers have focused on improving the MR and AMR in the last two decades through metal-doping [14], rare earth-doping [15], and optimization of the sintering temperature [16]. ...

Abstract

This article describes preparation of Barium (Zirconium) Titnate ($BaZr_{0.2}Ti_{0.8}O_3$) ceramics by the sol–gel technique and its structural, dielectric, ferroelectric, and piezoelectric properties investigated with sintering temperature variation. The phase and microstructure analysis of the sintered ceramics was carried out by X-ray diffraction method (XRD) and scanning electron microscopy (SEM), respectively. XRD analysis revealed structural transformation from cubic to tetragonal phase with increase in sintering temperature. Dielectric properties have been measured with variation of frequency up to 1 MHz and with temperature up to 200 °C. The BZT ceramics exhibit diffuse phase transition with normal ferroelectric behavior. Hysteresis loop measurements disclosed that BZT ceramics have good ferroelectric nature with saturation at higher applied electric fields. Leakage current density show negative temperature coefficient resistance (NTCR) behavior. The highest value (261 pC/N) of piezoelectric coefficient (d_{33}) has been obtained for BZT ceramic sintered at 1400 °C and revealed that ceramics have great potentials for electronic industry based on sensor technology.

Abstract and Figures

Multiferroic composites consisting of Na0.5Bi0.5TiO3(NBT) and NiFe2O4(NFO) phases have been synthesized by using sol-gel and metal-organic decomposition (MOD) methods. The X-ray diffraction (XRD) and scanning electron microscopy (SEM) results confirm NBT and NFO phase formation in all composite samples without the presence of any intermediate phases. The phonon vibrational modes of the composite samples are detected by Raman spectroscopy over wavenumber regions from 100 to 1000 cm−1 at room temperature. The dielectric constant and dielectric losses are measured over a wide range of frequencies from 1 kHz to 1 MHz at room temperature. Room temperature magnetization measurements confirm the ferromagnetic behavior of all the composite samples. The observed values of coercivity are significantly lower and lie between 9.5 and 49 Oe only, which signifies the soft magnetic behavior of samples. The highest leakage current density value (3.39 × 10−6) has been observed for 50NBT-50NFO composite in I–V measurements. The present study reveals that NBT-NFO composites could be potential lead-free multiferroic composites and provide an alternative for designing environment-friendly devices.

1 Introduction

Multiferroics with magnetic and electric orders occurring simultaneously have received great research attention due to their wide range of technological applications such as multi- composites have been developed to achieve superior properties compared with those observed in the individual components [6, 7]. Multiferroic composites exhibit a strong magnetoelectric effect due to product property, which arises from coupling between magnetostrictive and piezoelectric effect

magnetization by external electric field and variation of polarization in response to magnetic field show unexpected devel- is different from single-phase multiferroic materials, which can be described as the deformation of the magnetic phase which is trans- phase, produc- osition of two mposites has n induction of eld or magne-

... The M − H curve depicts the spontaneous magnetization due to the presence of the ferrimagnetic ferrite phase. Due to the presence of the ferroelectric phase, which is typically nonmagnetic and acts as the pinning centre of domain walls in composites, all of the composites have magnetically soft characteristics, with smaller coercive field (H c), remnant magnetization (M r), and saturation magnetization (M s) than pure CCFO [52]. Table 2, which depict the typically soft magnetic character of the composites. ...

be ween magnetic and electric fields, the artificial multiferroic tization and vice versa. It has been concluded that the ME effect is directly influenced by piezoelectric and magnetostrictive strengths or respective performance of ferroelectric and ferromagnetic phases respectively. It means that the coupling effect depends greatly on the properties of the respective components. Furthermore, the concept of composite materials having piezoelectric and magnetic coexisted phases such as $BiFeO_3$–$Pb(Zr_{0.52}Ti_{0.48})O_3$ [11], $Pb_{0.99}[Zr_{0.45}Ti_{0.47}$

Doping Effect of Cobalt on Various Properties of Nickel Oxide Prepared by Solution Combustion Method

Khem Raj Sharma & N. S. Negi

Journal of Superconductivity and Novel Magnetism **34**, 633–645 (2021)

442 Accesses | **12** Citations | Metrics

Abstract

Pure and cobalt-doped (Co-2 to 10 mol%) nickel oxide (NiO) powder samples were prepared by solution combustion method and annealed at 600 °C for 2 h. The crystalline and structural properties were characterised by using X-ray diffraction (XRD) and Raman spectroscopy. Field emission scanning electron microscope (FESEM) and energy-dispersive spectroscopy (EDAX) techniques were used to study the surface morphology and characteristic elements present in samples. Higher value of retentivity (12.20×10^{-2} emu/g) and coercivity (900 Oe) is found for 10 mol% Co-doped NiO, which is much higher than pure NiO. Such properties improve the magnetic memory and hardness of a magnetic material. A decrease in an optical band gap from 2.67 to 2.05 eV was observed for pure and Co-doped (2 to 10 mol%) NiO powder samples, which is quite useful in optoelectronic devices. Maximum value of conductivity ($11.23 \times 10^{-6}\ \Omega^{-1}\ cm^{-1}$) and dielectric constant (204) is found for Co 6 mol%-doped NiO. All the measurements were recorded at room temperature so as to utilise them for device fabrication readily. A significant improvement in magnetic, optical and dielectric properties was observed for NiO with increasing concentration of cobalt, which makes it a better choice for spintronic, optoelectronic, magnetic and storage devices.

Abstract

In this work, lead-free (1-x) $Ba_{0.85}Ca_{0.15}Zr_{0.1}Ti_{0.9})O_3$–$xCoFe_2O_3$ (BCZT-CFO, x = 00, 0.2,0.8 and 1) multiferroic composites have been prepared by chemical solution technique and sintered at 1300 °C. The article is focused on a systematic study of phase dominance effect on structure, microstructure, dielectric, magneto-dielectric, magnetic, electric, and magneto-electric properties of the BCZT-CFO composites. The XRD study confirms perovskite phase in BCZT, cubic spinal phase in CFO and mixed structural evolution in composite samples without any traceable secondary phase formation. William-Hall equation has been used to evaluate strain kinetics in pure and composite samples. The scanning electron micrographs show dispersion of smaller BCZT grains in larger CFO grains matrix. The dense microstructure has been observed for composite sample with ferrite phase dominance. The room temperature dielectric study reveals frequency-dependent dielectric dispersion characteristics for composites and pure CFO. The enhanced dielectric properties are observed for composite sample with ferroelectric phase dominance. The room temperature magneto-dielectric behavior has been observed for lead-free multiferroic composites. Under magnetic study, observed typical ferromagnetic M-H hysteresis loop reveals presence of long-range ferromagnetic ordering in pure CFO as well as in composite samples. The highest value of Ms ~ 38.2 emu/g and M_r = 1.2 emu/g has been measured for ferrite phase dominant composite sample. Higher coercive field H_c value has been observed for composite with ferroelectric phase dominance. Leakage current characteristic has been investigated at and above room temperature for prepared samples. The composite with ferrite phase dominance has shown higher leakage current characteristics. The enhanced magento-electric coupling coefficient has been measured for composite with higher ferrite phase concentration.

Abstract

Lead-free $Ba_{1-x}Ca_xZr_{0.1}Ti_{0.9}O_3$ thin films were deposited by sol-gel synthesis route. Dielectric studies demonstrate that the BCZT film for $x = 0.15$ exhibits a high dielectric constant ε'~5838 and a low loss tan δ~0.070 at 10 kHz. The BCZT thin films exhibited ferroelectric properties with a high saturation and remnant polarization P_s~25.5 μC/cm^2 and P_r~13.8 μC/cm^2, respectively, and a low coercive field E_c~15.04 kV/cm observed for sample with $x = 0.15$. The enhanced dielectric and ferroelectric properties at $x = 0.15$ may be due to its morphotropic phase boundary composition.

Abstract

Here in this article synthesis of lead-free magnetoelectric composites (1-x) $Ba_{0.85}Ca_{0.15}$ $Ti_{0.9}Zr_{0.1})O_3$ - $xCoFe_2O_3$ (BCTZ-CFO, x =0.4, 0.5, and 0.6) is reported. Structural, magnetic, dielectric, magnetodielectric and magnetoelectric properties of lead-free BCTZ-CFO composites sintered at higher sintering temperature have been systematically investigated. The piezoelectric (ferroelectric) phase has been synthesized using the sol–gel route, while Metallo-organic decomposition (MOD) route was employed to prepare piezomagnetic (ferrite) phase. The structural and microstructural properties were studied using X-Ray diffraction and Scanning electron Microscope respectively acknowledged the presence of two distinct phases as ferrite and ferroelectric in composite samples. The dense microstructure and larger average grain size were observed for samples with higher ferrite phase content. Long-range magnetic order was observed under magnetic study for all-composites. The magnetic properties enhanced for composites prepared with higher ferrite phase content. Dielectric properties were studied at room temperature and enhanced dielectric constant has been observed for samples with higher ferroelectric phase content, while minimum dielectric loss was observed for sample with 50/50 ferrite/ferroelectric phase composition. The magnetodielectric response has been also investigated for all ME composites. Leakage current characterization has been also discussed at and above the room temperature. The magneto-electric coupling response was measured of all composites. The higher value of magneto-electric coupling coefficient has been observed for 0.5BCTZ-0.5CFO composite due to maximum possible ferrite-ferroelectric hetero-structure phase contact area.

Introduction

Ferroelectric and ferromagnetic materials have been extensively studied over more than last five decades because of their various technological applications in electronic industries. With the development of electronic techniques and growing industrial demands, tremendous research has been carried out to realize the significance of ferroelectric and ferromagnetic materials in a new technological era [1], [2]. Ferroelectricity and ferro magnetization aretwo primary and exotic properties of ferroelectric and ferromagnetic materials respectively, wherein, the polarization is controlled by the electric field, and magnetization is controlled by the magnetic field. However, the cross-coupling between these two ferroic properties has established a new direction to further explore and investigate these materials. The phenomenon of cross-coupling provides possibility of electrically controlling magnetization and magnetically controlling polarization in multiferroic materials. The multiferroics are the class of materials in which two or more ferroic orders occur simultaneously and are potential futuristic multifunctional systems for designing novel electronic devices. The diverse multifunctional application of multiferroic materials includes magneto-electric sensors, oscillators, phase shifters, magnetoelectric (ME) resonators, memory devices; magnetoelectric random access memory (MeRAM), and multiple state memory devices [3], [4], [5], [6], [7], [8].

The magnetoelectric (ME) coupling effect usually occurs either in single-phase multiferroics or in artificially designed composite materials. However, single-phase materials exhibit weak magnetoelectric response and show multiferroic properties much below room temperature thus provide no significant practical applications [9], [10], [11]. In artificially designed multiferroic composites,

the ME coupling arises due to strain mediated interaction at interface of two coupled material having different ferroic orders. It means those multiferroic composites exhibit product property of two ferroic orders present in constituent phases. One of the important issues in designing multiferroic composite is the selection of constituent phase e.g. ferroelectric and ferromagnetic systems. Usually, ferroelectric phase having a remarkable high piezoelectric coefficient and ferromagnetic phase with a high magnetostriction coefficient are preferred in order to designed multiferroic composites with maximum possible ME response. Most extensively studied multiferroic composites are designed with lead-based ferroelectrics due to their high piezoelectric coefficient e.g. $CoFe_2O_4$–PZT, $BiFeO_3$-$PbTiO_3$, $[Pb(Fe_{0.5}Nb_{0.5})O_3]$1-x-$[Co_{0.65}Zn_{0.35}Fe_2O_4]$, $PbMg_{1/3}Nb_{2/3}O_3$-$PbTiO_3$, $PbZr_{0.65}Ti_{0.35}O3$-x$BaFe_{12}O_{19}$, $NiFe_2O_4$–PZT, and x$PbTiO_3$-(1-x)$SrFe_{12}O_{19}$. [12], [13], [14], [15], [16], [17]. However, lead and lead-based materials own serious threat to the environment and human health because of toxic PbO release during processing. Several international bodies have already restricted the use of lead-based materials [18]. The world-wide research work on ferroelectrics has been now shifted to search for lead-free systems comparable with PZT. On the other hand, the development of lead-free multiferroic composites is still at the infancy stage. Among lead-free perovskites, $BaTiO_3$ based systems emerge as preferable ferroelectric phases in designing multiferroic composites due to their environmental friendly processing and sintering suitability. $BaTiO_3$ and its derivatives are now established as potential lead-free ferroelectric materials having piezoelectric coefficient comparable to lead based PZT ceramics. Ren et al. [19] reported that $Ba_{0.85}Ca_{0.15}Ti_{0.90}Zr_{0.10}O_3$ (BCTZ) exhibits piezoelectric coefficient value d_{33}~620 pC/N due to morphptropic phase boundaries (MPB) structural evolution similar to lead-based PZT system. In addition, BCTZ has excellent mechanical coupling behaviour and is suitable for strain mediation at interface [20], [21]. On the other hand, CFO is a well-studied ferromagnetic material and this ferrite has been extensively employed in designing lead-based multiferroic composites. Besides high magnetostriction characteristics, CFO possesses magneto anisotropy, excellent magnetic properties, and high thermal stability [22], [23].

In our previous reported research work we developed the same composite systems i. e (1-x)$Ba_{0.85}Ca_{0.15}Ti_{0.90}Zr_{0.10}O_3$ – (x) $CoFe_2O_4$ (BCTZ-CFO) with× =0.1, 0.3, 0.5, 0.7, and 0.9 by chemical solution methods sintered at lower temperature 1050℃ for 2 h [24]. Crystal structure, multiferroic, dielectric and electromagnetic properties were investigated in that article. However, in BCTZ system usually show enhanced structural and electric properties at higher sintering temperature and therefore in the present work properties also remain sensitive to sintering temperature. In order to meet the requirement of device applications structural and physical properties of BCTZ-CFO systemhave been ameliorated by increasing the sintering time from 2 h to 5 h and temperature from 1050 ℃ to 1300 ℃. In the present article, we have reported synthesis and properties of (1-x) $Ba_{0.85}Ca_{0.15}Ti_{0.90}Zr_{0.10}O_3$ – (x) $CoFe_2O_4$, (x=0.4, 0.5 & 0.6) composites. Here, BCTZ phase has been synthesized using the same chemical solution methods; sol–gel technique has been used to develop BCTZ phase and MOD chemical solution process was used to synthesize CFO phase. The structural, microstructural, magnetic, dielectric, and magnetoelectric properties have been systematically investigated. As expected the physical properties of BCZT-CFO composite have been intensified in later case. For 0.5BCTZ-0.5CFO sample value of dielectric constant (at 1 MHz) enhances from 92 to 294, while dielectric loss declines from 0.4 to 0.03. Saturation magnetization (M_s) rises from 19.8 emu/g to 28.8 emu/g. Surge in the value of electromagnetic coupling coefficient from 0.63 mV/cmOe to 1.99 mV/cm.Oe is a major breakthrough in our present work.

Section snippets

Experimental procedure

$(Ba_{0.85}Ca_{0.15}Ti_{0.9}Zr_{0.1})O_3$ (BCTZ) ceramics were prepared by the sol–gel method. First, the required amount of barium acetate was taken in a beaker and dissolved in solvent 2-ethyl hexanoic acid. The precursor was heated up to temperature 100 ^{0}C. As the precursor was completely dissolved, an appropriate amount of calcium acetate was added to it. Similarly, after complete dissolution of calcium acetate, an appropriate amount of zirconium (IV) acetylacetonate (all are from Merck, made in Germany)…

Xrd

The combined plot of diffraction patterns of BCTZ-CFO composite samples sintered at temperature 1300 °C is shown in Fig. 1. The XRD patterns reveal presence of well-defined crystalline reflection lines corresponding to both constituent phases of the composite samples. The reflection lines in XRD patterns are indexed with tetragonal structure with space group symmetry of P4mm (JCPDS card no. 05-0626) for BCTZ [27] and cubic spinel structure with space group symmetry Fd$\bar{3}$m**Fd$\bar{3}$m** (JCPDS card no.…

Conclusion

In the present work, various properties such as structural, magnetic, dielectric, and Magento-electric properties have been studied for (1-x) $Ba_{0.85}Ca_{0.15}Ti_{0.90}Zr_{0.10}O_3$ – (x) $CoFe_2O_4$ (x=0.4, 0.5, 0.6) multiferroic composites sintered at higher temperature of 1300 ^{0}C.

Efficacy of higher temperature on the structural and physical properties is observed in the present study in comparison to the low temperature. Because, temperature plays the vital role in structural development. The physical…

Abstract

In this study, we report presence of optical anisotropy in very recently synthesized mono-elemental layered tellurene structures. Our results based on Density Functional Theory, reveal energetic and kinetic stability of five bare and janus tellurene allotropes. Graphene like tunable linear dispersion (Dirac cone) has been observed for σ tellurene. Optical response of bare and janus tellurene allotropes show that α, σ, γ allotrope are optically isotropic in nature whereas, β, δ and η allotropes are anisotropic. A blue shift in imaginary part of dielectric function and electron energy loss spectra has been observed for janus tellurene as compared to bare tellurene for E||c as well as E⊥c. The plasmon resonance have been observed about 7eV in α, γ and η while β, δ, and σ show plasmon resonance above 10eV. Tellurene mono-layers show optical anisotropy in UV–Vis region indicating its usefulness as photo-diodes, photo-catalysts, and photo-detectors.

Introduction

Two-dimensional (2D) materials have undergone a rapid pace of development since the discovery of graphene [1]. The success of graphene have motivated scientific community to devote efforts to explore other 2D materials which are similar to graphene having inherent electronic and physicochemical properties [2]. A number of 2D materials beyond graphene have been predicted and synthesized such as hexagonal boron nitride (h-BN) [3], TMD's [4], phosphorene [5], gallium sulphide [6] etc. Among these 2D materials, MoS_2 has been identified, both experimentally and theoretically as a promising material for various applications. The inherent direct band gap of 1.80eV can be tuned by controlling the number of layers [7], electric field [8], mechanical strain [9], etc. Furthermore, it has been reported experimentally [10], [11] and theoretically [12] that TMD's based janus structures break the inversion symmetry that results in structural anisotropy leading to interesting properties such as large piezoelectricity[10] and Rashba spin splitting [13], [14].

Very recently, chalcogenide mono-elemental layered structures called 'Tellurene' have been successfully synthesized [15], [16], [17] which show structural analogy to TMD's. Experimentally, tellurene has been found to exhibit high on/off ratio [18], excellent photoconductivity [19], non-linear optical response [20], high thermoelectric [21] and piezoelectric [22], [23] properties. These properties make tellurene a potential candidate for variety of applications such as FET [18], photo-detectors [24], batteries [25] etc. Various distinct layered phases of Te have been predicted depending upon orientation of cleavage plane e.g. α (1T-MoS_2 like), tetragonal β and γ phase (2H MoS_2 like) [15]. Recently, two more stable allotropes of tellurene have been predicted namely δ and η-tellurene [26] and a new stable phase of monolayer tellurene has been synthesized on Cd-terminated CdTe wafer surfaces [27]. Besides, ongoing experimental and theoretical studies on tellurene, no particular attention has been given to understand optical properties of tellurene in distinct phases. In this work, we explore structural, electronic and optical properties of six different phases of tellurene and its janus allotropes. Janus structures have been chosen as they offer an advantage of good growth control and more feasible fabrication. The density functional theory (DFT) has been employed to study bare and janus tellurene allotropes with the aim to study i) structural properties of bare and janus tellurene allotropes, ii) modulation in electronic band structure, carrier effective masses, iii) tunability in optical properties including static dielectric constant, imaginary part of dielectric function and electron energy loss spectra.

Section snippets

Simulation details

A Vienna ab-initio Simulation Package (VASP) [28] has been used to get optimized geometry structures of 2D tellurene within the framework of density functional theory (DFT). The exchange–correlation energies were treated using generalized gradient approximation within Perdew-Burke-Ernzerhof parameterization [29]. The plane wave cut-off energy of 400eV has been used. The atomic positions were fully optimized until the forces on all atoms were less than 10^{-6}eV/Å. The energy convergence criteria …

Structural properties

The geometric structures for six different allotropes of two-dimensional tellurene have been depicted in Fig. 1. Out of six different allotropes α and γ have honeycomb-like geometry and β, δ, η and σ have non-honeycomb geometry. The α and γ phases have 1T and 2H MoS_2 like structure containing three atoms in a unit cell. The central Te atom in α and γ phase have larger coordination number as compared to top and bottom atom in a monolayer. It results in dual nature (metallic and semiconducting)…

Conclusions

The Density Functional Theory (DFT) has been employed to study structural, electronic and optical properties of bare and janus tellurene allotropes. We find α, β, δ, η and σ tellurene allotropes energetically and kinetically stable. The γ allotrope show energetic stability but found kinetically instable due to out-of-plane vibrations which are expected to be stabilized on suitable substrate. Bare and janus tellurene allotropes exhibit versatile electronic properties ranging from semiconductor…

Abstract

The Hydrogen and Fluorine planar armchairs graphene nanoribbons (H **&** F AGNRs), subjected to twist deformation within fixed periodic boundary conditions. H-AGNRs is highly elastic in nature, though passivation with Fluorine does induce the plasticity when twisted beyond threshold torsional strain. This plasticity attributes to the wider bond length distribution suggests distortion of benzo-rings. The bandgap response to the effective strain of narrow GNRs $N = 6, 7,$ and 8 get arranged as (*i*) monotonously increasing for $q = 0, 2$ and (*ii*) decreasing for $q = 1$; here, $q = mod\,(N, 3)$ in effective strain space $(\theta^2 \Sigma^2)$. The effective strain space is found to be more appropriate for gauging the response of torsional strain. This trend has also been observed for Fluorine passivated AGNRs; however, because of higher sensitive response to torsional strain, the bandgap of N =7 F-AGNRs drops from $E_g \simeq 0.95\mathrm{eV}$ to $E_g \simeq 0.05\mathrm{eV}$ at extreme torsional strain forming Dirac cone at $\pm K$ allows dissipationless transport to charge carriers of high kinetic energy at low bias.

NAM & New Information and Communication Order

Dr. Yog Raj

Information and Communication Technology (ICT) has the potential to make the world a better place and contribute immensely to the attainment of the Sustainable Development Goals, particularly, in the developing world.

Non-Aligned Movement has always supported the implementation of Information and Communication Technology (ICT), the use of which has effectively changed the world, especially in current senerio. But due to this "digital revolution", many adverse elements have also become active ever since the use of internet entered the public domain. The digital revolution has changed the way people shape their daily lives, and helped pave the way for growth and economic development. With this background, NAM has urged for the world leaders to enforce the results of the World Summit on Information Society. NAM also believes in the use of the ICTs to enhance the implementation and following of a democratic way of governing, equality and the rule of law at national, internal and regional level.

Since 1970s, NAM members began raising their voice against the Western dominated information and communication system. They have protested against the quantitative as well as qualitative imbalance in the international flow of information, inequalities in communication capabilities, allocation of radio frequencies and geo-stationary orbits, disparity in communication tariffs and barriers to scientific and technical information.

The NAM countries have felt the need to alter this serious imbalance in the sphere of information and mass media, and bring about greater reciprocity in the flow of information. They have underlined the need to reaffirm their national, cultural identities.

It was this understanding that led the Algiers conference (1973) to moot the idea of a non-aligned news pool. The Algiers summit conference gave the first impetus to third world's demand for the movement for a fair deal in the vital area of international communication system. There, the delegates decided that the developing countries should get together and adopt joint measures to promote mutual exchange of ideas inspired by the following principles:

a) reorganization of existing communication networks which were inherited from the colonial past,

b) an initiative for joint measures to revise current institutional agreements with the aim of revising the tariffs for new reports and facilitating faster and cheaper communications,

c) urgent measures to accelerate the process of collective acquisition of communication satellites and elaboration of a code of conduct for regulating the manner of their use,

d) closer contacts between information agencies, universities, libraries, planning and research bodies and other institutions with a view to carry out an exchange of experiences and technological knowhow and ideas.

The conference decided that the Secretary General of the UN should be called upon to set up a special department for studies regarding non-alignment in the university which the UN proposed to create. Likewise, the developing countries should themselves encourage similar studies at their universities and scientific institutions. The Non-aligned nations should exchange and disseminate information on mutual achievements in all domains, through newspaper, journals, radio, television and information media in their countries. They should formulate plans to share experiences in this sphere by organizing exchange visits of delegations of specialists in the information media, as well as by an exchange programme of photographs, cultural delegations and art festivals.

The March 1976 Tunis symposium organized by the non-aligned countries puts it rightly that, "it was the duty of the non-aligned countries to alter the imbalanced situation (in respect of area of communication) to decolonize information and to conceive of a new world order for information".[3] Attended by fourty non-aligned countries, the symposium made detailed recommendations that are as follows:

1. to urge the countries with adequate information agencies to collaborate with other countries to help them form their own information agencies either by training personnel or by providing material support for the setting up of technical organs,

Challenges Faced by Teachers During Covid-19 Pandemic

Dr. Yog Raj

A Serious situation the world has faced, a virus is spreading very fast almost in every country leaving millions infected and thousands of dead. The whole aspects of life have been affected, health, economy, travels, manufacturing, trade and education is not exception. Universities cancelled face-to-face study, cancelled study-abroad programme, forced students to leave dorms and in some cases students in off- campus housing, too, were asked to vacate and moved to online teaching. Meanwhile scheduled conferences and seminars have been cancelled and almost every sports event or even practice have also been put on hold. The Corona virus pandemic has upended the world's education system, as most school, colleges and universities in almost every country have closed their doors for extended periods to combat the spread of the virus. Millions of students across the world have been infected by the COVID-19 virus.

The **COVID-19 pandemic**, also known as the **Corona virus pandemic**, is an ongoing global pandemic of Corona virus disease 2019 (COVID-19), which is caused by severe acute respiratory syndrome Corona virus 2 (SARS-CoV-2). The virus was first identified in December 2019 in Wuhan, China. The World Health Organization diest pandemics in history.

The severity of COVID-19 symptoms is highly variable, ranging from unnoticeable to life-threatening. COVID-19 transmits when people breathe in air contaminated by droplets and small airborne particles. The risk of breathing these in is highest when people are in close proximity, but they can be inhaled over longer distances, particularly indoors. Transmission can also occur if splashed or sprayed with contaminated fluids, in the eyes, nose or mouth, and, rarely, via contaminated surfaces. People remain contagious for up to 20 days, and can spread the virus even if they do not develop any symptoms.

Recommended preventive measures include social distancing, wearing face masks in public, ventilation and air-filtering, hand washing, covering one's mouth when sneezing or coughing, disinfecting surfaces, and monitoring and self-isolation for people exposed or symptomatic. Several vaccines have been developed and widely distributed since December 2020. Current treatments focus on addressing symptoms, but work is underway to develop medications that inhibit the virus. Authorities worldwide have responded by implementing travel restrictions, lockdowns and quarantines, workplace hazard controls, and business closures. Numerous jurisdictions have also worked to increase testing capacity and trace contacts of the infected.

The pandemic has resulted in significant global social and economic disruption, including the largest global recession since the Great Depression of the 1930s. It has led to widespread supply shortages exacerbated by panic buying, agricultural disruption, and food shortages. However, there have also been decreased emissions of pollutants and greenhouse gases. Numerous educational institutions and public areas have been partially or fully closed, and many events have been cancelled or postponed. Misinformation has circulated through social media and mass media, and political tensions have been exacerbated. The pandemic has raised issues of racial and geographic discrimination, health equity, and the balance between public health imperatives and individual rights.

The world as we know it has changed in the blink of an eye. Schools closed overnight students were liberated from schools (But confirmed to their homes), and parents had to grapple with keeping children productive at home. But the mission of our Education system is to overcome learning crisis and reduce negative impact of this pandemic on learning and schooling. The education system has faced huge challenges due to the COVID-19 pandemic. Teachers have also to face a lot of challenges and problems.

THIRD CONCEPT

An International Journal of Ideas

Vol. 31 No. 367 SEPTEMBER 2017 Rs. 20. 00

Third Concept aims at providing a platform where a meaningful exchange of ideas can take place among the people of the Third World. The attempt will be to communicate, debate and disseminate information, ideas and alternatives for the resolution of the common problems facing humankind. We welcome contributions from academics, journalists and even from those who may never have published anything before. The only requirement is a concern for and desire to understand and take the issue of our time. Contributions may be descriptive, analytical or theoretical. They may be in the form of original articles, reactions to previous contributions, or even a comment on a prevailing situation. All contributions, neatly typed in double space, may be addressed to:

Editor	*Consulting Editor*
Babuddin Khan	**M. L. Sharma**
Managing Editor	*Art Director*
R. Prudhvi Raju	**Purba Roy**
Business Executive	*Chief of Production*
R.S.Rawat	**N. P. Agarwal**

While the Editor accepts responsibility for the selection of materials to be published, individual authors are responsible for the facts, figures, and views in their articles. However, the Editor reserves the right to edit the articles for reasons of space and clarity.

AN INTERNATIONAL PEER REVIEWED, REFEREED MULTIDISCIPLINARY
& MULTIPLE LANGUAGES RESEARCH JOURNAL

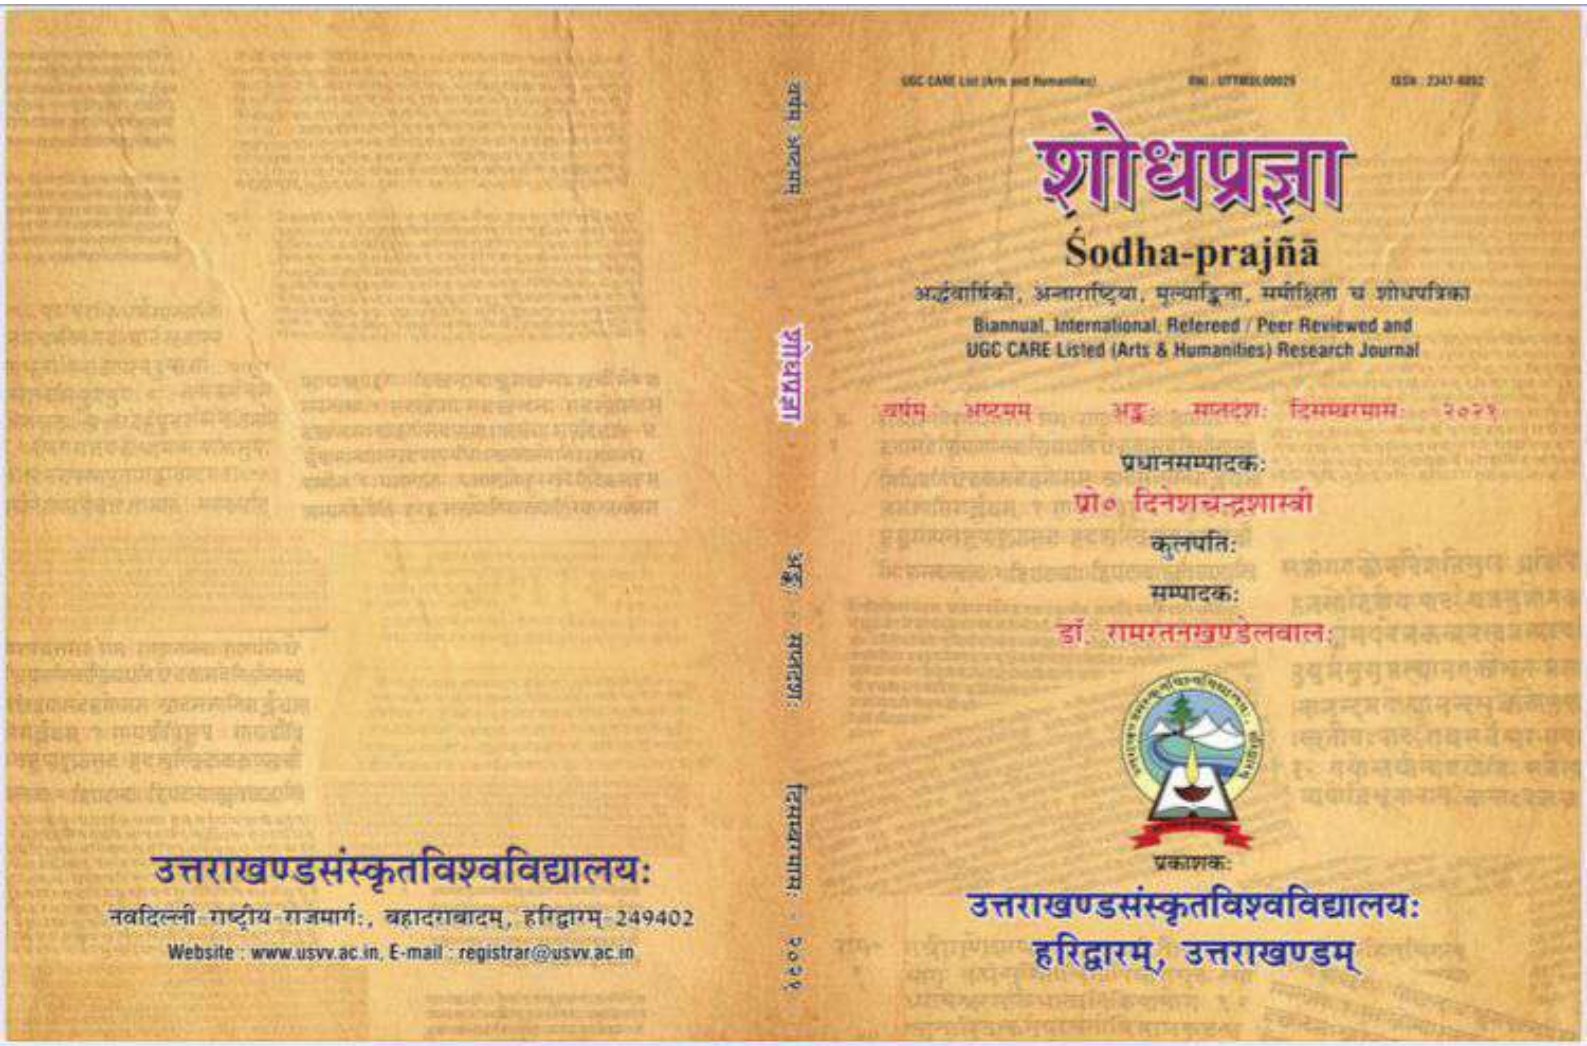
मोक्ष का साधन सत्संग : एक विवेचना

डॉक्टर बिशंबर सिंह रंजन, सहायक आचार्य,
विनोद कुमार शर्मा, पीएचडी शोधार्थी,
योग अध्ययन विभाग, योग अध्ययन विभाग, हिमाचल प्रदेश विश्वविद्यालय, हिमाचल प्रदेश विश्वविद्यालय।

चौरासी लाख योनियों में भटकता हुआ जीव जब मनुष्य देह को प्राप्त करता है तो वह परमात्मा को प्राप्त कराने वाली सीढ़ी पर पहुंचता है। मनुष्य देह में ही जीव कर्म करने में स्वतंत्र है। जीव अधिक पुण्य अर्जित करता है तो वह स्वर्ग को प्राप्त करता है और स्वर्ग से अर्जित पुण्य क्षीण होने पर पतित होता है :–

'ते तं भुक्त्वा स्वर्गलोकं विशालंक्षीणे पुण्ये मर्त्यलोकं विशन्ति।'[1]

यदि जीव अधिक पाप करता है तो उसे तिर्यक योनि में जाना पड़ता है वहां भी जीव नूतन कर्म नहीं कर सकता केवल किए गए पाप कर्मों को ही भोक्ता है और यदि पुण्य कर्म अधिक होते हैं तो स्वर्गलोक की प्राप्ति होती है परन्तु दोनों ही योनियों में कर्म करने की स्वतंत्रता नहीं है। कर्म करने की स्वतंत्रता केवल मनुष्य देह में ही जीव को प्राप्त होती है इसलिए मनुष्य देह कीसंतों ने प्रशंसा की है।



चौपाई :– बड़े भाग मानुष तनु पावा। सुर दुर्लभ सब ग्रंथन्हि गावा।।
साधन धाम मोक्ष कर द्वारा।पाइ न जेहि परलोक सँवारा।।[2]

श्री रामचरितमानस में तुलसीदास ने बड़े सुंदर ढंग से वर्णन किया है कि यह शरीर बड़े ही भाग्य से मिलता है सद ग्रंथों ने यही कहा है कि यह शरीर देवताओं को भी दुर्लभ है अर्थात कठिनता से प्राप्त होता है यह साधन का धाम है अर्थात मनुष्य देह से ही साधन किया जा सकता है।

योग साधना में साधन बहुत प्रकार के हैं जिनमें अष्टांग योग, ज्ञान योग, कर्म योग व भक्ति योग और इसके अतिरिक्त कई अन्य प्रकार के योग साधन भी हैं परंतु मनुष्य का मन–बुद्धि इन साधनों में लगे या यूं कहें कि मनुष्य आत्म कल्याण के मार्ग पर प्रेरित हो इसके लिए सत्संग का विशेष महत्व है सत्संग अर्थात संतों का संग, श्रेष्ठ पुरुषों का संग, सत्य का संगव स्वाध्याय आदि सत्संग कहलाता है। मनुष्य सत्मार्ग पर चले इसके लिए सत्संग बहुत ही आवश्यक है। सत्संग के प्रभाव को विभिन्न ग्रंथों में विस्तार पूर्वक कहा है। तुलसीदास जी कहते हैं कि :–

चौपाई :– सठ सुधरहिं सतसंगति पाई। पारस परस कुधात सुहाई।।[3]

दुष्ट भी सत्संगति पाकर सुधर जाते हैं जैसे पारस केस्पर्श से लोहा सुहावना हो जाता है। यह सत्संग का ही प्रभाव ही की कोई दुरात्मा भी सत्संग के प्रभाव से पुण्यात्मा बना जाता है क्षणभर के सत्संग से मनुष्य में सद्बुद्धि का प्रादुर्भाव हो जाता है और मनुष्य अपने आत्म कल्याण के मार्ग पार अग्रसित हो जाता है।

घेरण्ड संहिता में वर्णित योगासनों में योग चिकित्सा का स्वरूप

कुमारी शिल्पी[1]
शोधार्थी (पीएचडी रिसर्च स्कॉलर) योग अध्ययन विभाग
हिमाचल प्रदेश विश्वविद्यालय, शिमला
डॉ अर्पिता नेगी[2]
सहायक आचार्या, योग अध्ययन विभाग
हिमाचल प्रदेश विश्वविद्यालय शिमला

शोध संक्षेप :–

प्रस्तुत शोधपत्र में घेरण्ड संहिता में वर्णित योग चिकित्सा के स्वरूप को स्पष्ट करने का प्रयत्न किया गया है क्योंकि योग चिकित्सा के बहुआयामी स्वरूप को वर्तमान में समझना अत्यन्त आवयश्यक है जबकि हम एक ऐसी जीवनशैली व समय में जीवन यापन कर रहे है जहां शारीरिक व मानसिक रोग होना एक सामान्य सी बात हो गयी है योग चिकित्सा का स्वरूप भी उतना ही पौराणिक है जितना कि योग स्वयं। प्रस्तुत शोध में घेरण्ड संहिता में वर्णित आसनों में स्पष्टतः रोग निवारण के लिए आसन करने के नियम बताये गये है इस शोध पत्र में यह जानेगे कि किस आसन विशेष से हम अपने रोगी शरीर को स्वस्थ व पुर्नस्थापित कर सकते है।

मूल शब्द – योग, योग चिकित्सा, आसन

प्रस्तावना :–

आसन का शाब्दिक अर्थ है – बैठना या बैठने की विशेष प्रक्रिया'। महर्षि पतञ्जलि ने अष्टांग योग में (यम, नियम, आसन, प्रणायाम, प्रत्याहार, धारणा, ध्यान) समाधि में आसन का तृतीय स्थान दिया उसके साथ ही गोरक्षनाथ जी ने षड्गयोग में आसन का प्रथम स्थान दिया इसी प्रकार घेरण्ड संहिता में भी सप्त साधन को साधन के लिए तृतीय स्थान पर आसनों का वर्णन है। योग सूत्र में आसन की परिभाषा **स्थिर सुखं आसनम्**[2]जिस शारीरिक स्थिति में आप स्थिर रह सकें और सुख का अनुभर करें, वह आसन हैं आसनों को दो भागों में विभक्त किया गया है गतिशील आसन व स्थिर आसन

17 वीं शताब्दी ने महर्षि घेरण्ड द्वारा रचित 'घेरण्ड संहिता' में आसनों की महत्ता बतायी गयी है।[3]

महर्षि घेरण्ड ने राजा चण्डकपालि को शारीरिक स्थिरता के लिए 32 आसनों की शिक्षा दी एवं आसनों की महत्ता को बताते हुए महर्षि घेरण्ड ने बताया कि आसनों के अभ्यास से शारीरिक एवं मानसिक कष्टों से मुक्ति मिलती है। आसन वही जिसको आसानी से किया जा सके और जो शरीर के लिए लाभकारी हो।

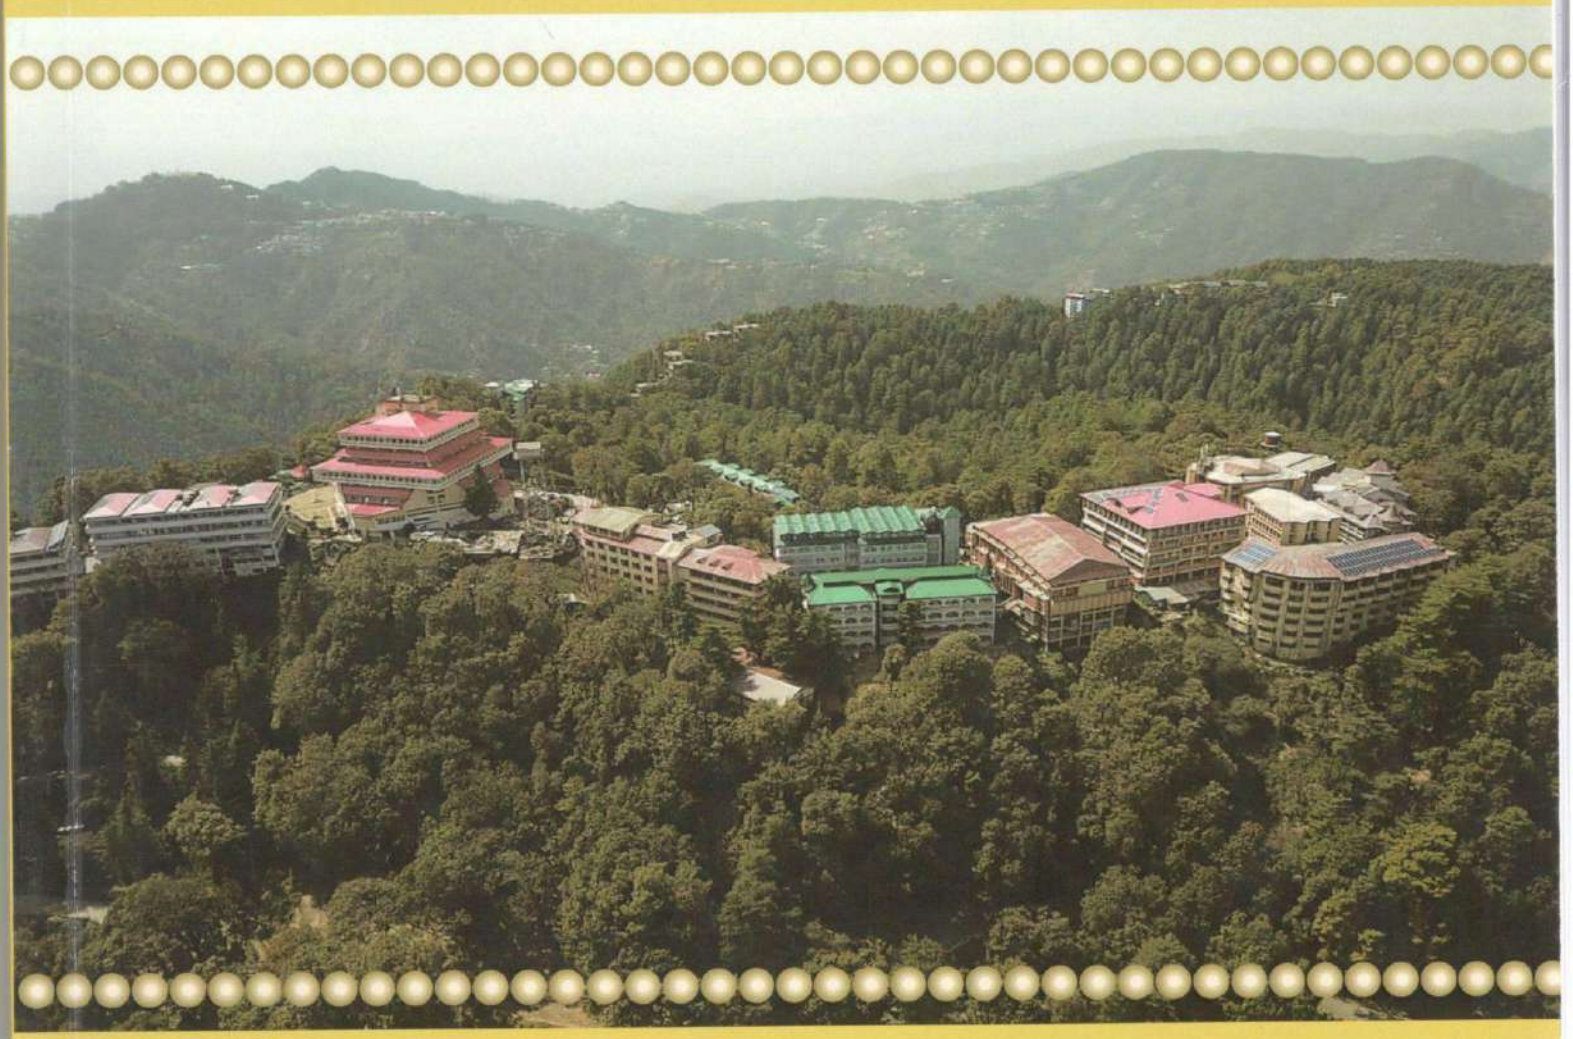
आसन के मुख्यतः लाभ शरीर को सुदृढ़ एवं लचीला बनाना है। आसन मुख्यतः हमारे पेशी तंत्र पर कार्य करके शरीर एवं इन्द्रियों सामञ्जस्य स्थापित करते है और आंतरिक अंगों की मालिश कर उनकी कार्य क्षमता का बढ़ाते हैं।

महर्षि घेरण्ड ने जिस प्रकार योगासनों का अभ्यास बताया है वह आसन की अन्तिम स्थिति है तथा व्यक्ति विशेष द्वारा अपने शरीर की क्षमता अनुसार प्रकारन्तरों का अभ्यास करते हुए उस अन्तिम स्थिति को प्राप्त करने के निर्देश बताये गये है।

महर्षि घेरण्ड रचित 'घेरण्ड संहिता' में आसनों का अभ्यास–2 में सम्मिलित किया गया है जो 'आसन प्रकरण' नाम से प्रचलित है।

महर्षि ने स्पष्टतः बताया कि आसनों का अभ्यासशरीर शुद्धिकरण के बाद एवं प्राणायाम से पूर्व करना ही लाभप्रद हैं। शरीर में उत्पन्न सूक्ष्म प्रभावों के साथ आसन के अभ्यास से शरीर में दृढता एवं स्थिरता आती है।

शरीरमाद्यं खलु धर्मखाधानम् शरीर के माध्यम से ही मनुष्य सभी धर्मों को साध सकता है। आसन के बारे में महर्षि घेरण्ड ने लिखा श्लोक –



आसनानिसमस्तानि यावन्तो जीवजन्तवः।
चतुरशीति लक्षाणि शिवेन कथितानि च।। 1।।

CONCEPTUAL UNDERSTANDING OF YOGA AND YOGIC PERSONALITY DEVELOPMENT WITH SPECIAL REFERENCE IN ŚRĪMADBHAGAVADGĪTĀ

Dr. Satyaprakash Pathak
Assistant Professor,
Department of Yoga Studies,
Himachal Pradesh University, Shimla-171005

Yoga and Yogic Personality

The scientific evidence of *Yoga Sādhnā* (Yoga practice) is traced back to Indus Valley Civilization which is *Vaidic* age before the Morden civilization started to flourish in the Indus subcontinent. In archaeological excavations made in the Indus Valley at *Harappā* and *Mohenjo-Daro* a figure is found that archaeologists believe represents a *Yogī* sitting in *Dhyāna* (Meditation) with *Yogic* posture. The figure is shown sitting in cross-legged traditional *Yogāsana* with its hands resting on its knees. According to Indian mythology Lord *Ādinātha* , the other name for Lord *Śiva* is believed to be the founder of *Yoga* and *Yogic* Traditions and *Pārvati* his divine consort first disciple of *Yoga Sādhnā.*

The word *Yoga* has been derived from *Sanskrit* grammar the verb root √*Yuj* in a Sanskrit grammar In *Sanskrit* literature on *Yoga* seems to use the word in all the three senses. √*Yuj Samādhau* – Integration, √*Yuj Saṃyamane* – Control √*Yujir Yoge* – Joining So far, the first two meanings are concerned; all the literatures and schools of *Yogic Sādhnā-s* have unanimously accepted these meanings. *Patañjali*, the first systematize of the Yogic discipline seem to accept the meaning of *Yoga* as integration–since the first commentator of *Pātañjalayogasūtram* on *Vyāsa* in his commentary writes: *Yogaḥ Samādhiḥ* i.e. *Yoga* is *Samādhi. Patañjali* does not subscribe to the other meaning of √*Yuj* i.e.*Yujir Yoge* 'joining'. This is mainly because *Patañjali-s* philosophy is based on *Sāṁkhyan* metaphysics and *Sāṁkhyan* believes in separation of *Puruṣa* from that of *Prakṛti*. With which *Puruṣa* has wrongly got itself identified. Similarly *Patañjali* considers *Draṣṭā* Seer Principle to be separated from *Dṛśya* (Seen Principle) with which it has got identified. Thus separation of these two principles is supposed to be *Yoga.* We also find meaning of *Yoga* as separation in *Śrīmadbhagavadgī. Yoga* helps in the co-ordination and control of the subtle forces within the Body. *Yoga* brings in perfection, peace and everlasting happiness; one can even have increased energy, vigour, vitality, longevity, resistance, calmness, and good sleep at times by the *Yogic Abhyāsa* (Practice). The *Yoga Abhyāsa* will help people to control the emotions and passions and resistance power increases and removes the disturbing elements from Mind. The aim of *Yogic Sādhanā-s* (Practices) is to overcome all kinds of sufferings that lead to a sense of freedom in every walk of life with holistic health, happiness and harmony. *Yogic Sādhanā-s* is practiced with a therapeutic intention in the form of *Yogic* Therapy, it can help prevent and aid recovery from Physical and Mental ailments. The continuous practices of *Yoga Abhyāsa* (practices) have much effect on the Human Body and Mind such as: All round health fitness, Weight loss, Stress relief, Inner peace, improved immunity, living with greater awareness, Better relationships, increased energy, Better flexibility and posture, Better intuition etc. It's all kind of Development in Morden life that is called Personality. The benefits accrued by being a regular practitioner are numerous. Some very discernible ones are – improvement a health, Protection from strength, improvement or Physical strength, protection from injury and detoxify the Body. In Modern era *Yoga Sādhanā and Yogic* Therapy is gaining among mainstream medical

RELEVANCE AND UTILITY OF YOGA EDUCATION IN TEACHER EDUCATION- THE FUTURE AHEAD

Dr. Satyaprakash Pathak*
Sunil Sharma**

ABSTRACT

Teacher education programme is related to the development of teacher proficiency and competence that would enable and empower the teacher to meet the requirements of the profession and face the challenges therein. On the other hand, Yoga is "Union" in love between the individual consciousness and Supreme Consciousness i.e. between Soul and God. In modern times Yoga is seen as the science of possibilities, the knowledge that enables the latent powers within oneself to be manifested in the outside and thus helpful in dealing with crucial problems of human life. Therefore, after the popularization of holistic health promotion potentials of Yoga practices among masses, certain other applied aspects of the Yogic system concerned with human resource development, have remained to be substantiated scientifically. That is why modern educationists are taking keen interest in improving the quality of education with the help of Yoga education. Education system, not only in India, but in the modern globalizing world also is in great need of taking help of Yoga and its applied areas. It is seriously being felt that besides the development of national strength and scientific mentality among the students, the aim of education should be the liberation of mind and soul as well; an area which can be deftly dealt with through Yoga. The time has arrived when Yoga should be the essential part of the core curriculum for teacher education programmes as they are at the root of the entire education system.

Key words: *Yoga Education, Teacher Education, Yogic Lifestyle.*

Introduction

1. Teacher Education

The education of teachers is an integral part of the educational system in any country. An educational institution performs a significant function of providing learning experiences to lead its students from the darkness of ignorance to the light of knowledge. The key personnel in the institutions, who play an important role to bring about this transformation, are teachers. As stated by NCTE (1998) in Quality Concerns in Secondary Teacher Education, "The teacher is the most important element in any educational program. It is the teacher who is mainly responsible for implementation of the educational process at any stage."

RELATIONSHIP OF CREATIVITY TRAITS WITH ACADEMIC PERFORMANCE OF PUPIL TEACHERS OF PHYSICAL EDUCATION

Dr Manohar Lal* & Dr Sanjay, Sharma **
** Professor, G.H.G. Khalsa College, Gurusar Sadhar, Ludhiana (Punjab)*
***Assistant Professor, Department of Physical Education, H. P. University, Shimla*

Abstract
The study analyzes the relationship of creativity traits with academic performance of pupils' teachers of Physical Education. The sample of present study were 100 subjects included male (n=50) and female (n=50) students of B. P. Ed and M. P. Ed Programs of Panjab University, Chandigrah. In order to accomplish the targets a standardized inventory developed by Purohit, 1997 was utilized to investigate the level of creativity traits of pupil teachers. Academic performance of the students was measured form the last semester result declared by Panjab University Chandigarh. The result shows that male pupil teachers of physical education are more openness, freedom, conflict and risk taking and less challenges and liveliness. There exists a significant relationship of academic performance with openness, conflict traits and risk-taking of creativity among male pupil teachers of physical education. Female pupil teachers of physical education possess more freedom, openness, and risk taking and less challenges, liveliness and conflict traits. There exist a significant relationship of academic performance and openness and risk-taking traits among female pupil teachers of physical education.

Introduction

Creativity implies in a real sense, "make", "creation" or "inventive power" and "capacity to make new works". It is generally another idea, particularly connected with the idea of creative mind (Nami et al 2014). Innovativeness is a capacity to consider things in better approaches to accomplish strange and special arrangements in problems (Saif, 2008). As per Akinboye (2003), without innovativeness, an individual can't get to the totality of information and assets accessible, however is secured up old propensities, structures, examples, ideas and discernments.

This is the reason that innovativeness, generative impression, useful and design thinking in addition to advancement should shape the premise of any education for practical turn of events. There are hopeful individuals who express normal considerations, who are propelling and motivating others. Individuals are creative, innovative daring people and contenders. In any case, their quality is distinctive in degree starting with one individual then onto the next. Creativity is discovering ideas or relationship among existing and new ideas or revising what is known to discover what isn't known (Arya et al 2016). Creativity is the ability of a person to solve a problem in creative manner. With the use of creative knowledge one can solve specific problems. Creativity energizes the group of ideas, which we need regularly. Creativity is characterized as the innovative human credits and characteristics concerned about creative mind, imaginativeness, extemporization, knowledge, establishment and interest the regular, tricky, virtuoso and ability of individuals (Lloyd 2008).

A few experts center around innovativeness as intellectual abilities while different gatherings know it as an aptitude which is established in character. While in the meaning of Boden, innovativeness alludes to making the new conclusions that should be appealing and justifiable. Also; Court knows innovativeness as human intellectual ability which helps individuals to apply their reasoning and start sentiments and goal (Simpson, 2012). Creativity has the power to change society, and make an individual go over his or her comfort zone and explore risks (Csikszentmihalyi, 1996). Furthermore, people who are high in creativity are adaptable not only regarding novelty but also in the adaptation of the known facts to fit novel solutions (Csikszentmihalyi, 1996). This all leads to considering creativity as a practical, valuable, and needed characteristic for the individual as well as society. As per the statement of San'chez-Ruiz (2011) creativity is a multidimensional marvel with numerous powerful factors comprising of character attributes, intellectual limits, psychological strategies and "inspiration" and it is showed up in social relationship anyway it is a private matter.

INJURY PROFILE OF PANJAB UNIVERSITY MALE WRESTLERS

Dr Manohar Lal Professor, G.H.G. Khalsa College, Gurusar Sadhar, Ludhiana (Punjab)
Dr Sanjay, Sharma Assistant Professor, Department of Physical Education, H. P. University, Shimla

Abstract:

The current investigation gives information with respect to the injury profiling of male grapplers. The information was gathered through self-made questionnaire from the grapplers of Panjab University Chandigarh. A questionnaire was administered to 50 male wrestlers to assess the nature and kinds of injury, follow up of restoration, how much time training and competition missed. Percentage method was used as statistical measure for the analysis of data. The kind of injury experience by male grapplers was 36% ligament, 40% tendon related and 24% dislocation. Ligament and tendon related injury were the most well-known in wrestling. The best number of injuries were shoulder, knee, elbow and wrist. The level of shoulder injury and knee was 66% and 64%, respectively. Wrist and elbow injury in wrestling was 12% and head injury and lower leg injury were 6%. There were the variations of injuries rate in wrestling. The most happening injury was shoulder and knee injury in wrestling. Most injuries happened due to ill-advised preparing plan, ill-advised warm up, doesn't went to specialist, doesn't taken any clinical help and doesn't follow the correct recovery program. The shoulder and knee injury were re-happened as a result of inappropriate development of rehabilitation program.

Keywords: Injury, Wrestlers and Rehabilitation

Introduction:

Wrestling is a physical combat sport. It is one of the oldest sports not only in India but also in the World. Wrestling has evolved into a highly intense and technical, international sports today. Wrestling is a form of grappling type techniques such as clinch fighting, throws and takedowns, joint locks, pins and other grappling holds. A wrestling bout is a physical competition, between two (occasionally more) competitors or sparring partners, who attempt to gain and maintain a superior position.

As a combat and contact game, all body parts are associated with the different snapshots of assault and protection, expanding the danger of injuries. At the 2008 Beijing Olympic Games, wrestling enlisted 32 injuries among 343 competitors in 406 matches with a rate pace of 9.3 injuries per 100 competitors and 7.9 injuries per 100 matches (Akbarnejad and Sayyah, 2012). At the Rio Olympic Games, out of 352 grapplers, 22 injuries happened during 410 matches, relating to a rate pace of 6.2 injuries per 100 grapplers (7.1% male; 4.4% female) and 5.4 % per 100 matches. Identified with the styles, the injury event was 22.7% in female wrestling, 36.4% in freestyle, and 40.9% in Greco-Roman (Shadgan, Molnar, Sikmic, and Chahi, 2017). Similar authors notice that injury rates have been diminishing in Olympic wrestling (Beijing 2008 (9.3%), London 2012 (12%), and Rio 2016 (6.2%).

In spite of reducing injury rates, it is as yet fundamental to investigate how training cycles, mentors, and competitors' attributes may help in forestalling and advancing a safer and solid games practice. Injury event is arbitrary and unmanageable, and there is no uncertainty about its effect on competitors' wellbeing, execution, and sports insight. Proof based exploration uncovers that present day games advances a culture of competition and succeeding at all expense; in Olympic wrestling, this inclination demonstrates that competitors see themselves committed to contend in any event, when harmed, endorsing a culture that advances pain standardization (Hoppis, 2012). A similar authors noticed that grapplers are needed to treat by mentors, colleagues, and directors in any event, when harmed, explicitly 44.6% from mentors and 55.9% from actual coaches. These discoveries infer that grapplers' career quality, wellbeing, and positive experience are in danger since such practices and convictions increment the danger of making a pattern of re-incidence because of a lacking recovery process (Hoppis, 2012; Nor, 2001).

RELATIONSHIP OF BODY COMPOSITION AND EMOTIONAL INTELLIGENCE WITH COMPETITION PERFORMANCE OF ALL INDIA INTER-UNIVERSITY SPRINTERS

Mrs. Surishtha Devi*
Dr. Sanjay Sharma**
Dr. Manohar Lal***

ABSTRACT

The purpose of present research is relationship of body composition and emotional intelligence with competition performance and making a comparison between high achievers (n=8) and low achievers (n=15) sprinters of All India inter-university in body composition and emotional intelligence. In order to evaluate emotional intelligence, the scale developed by Hyde, Pethe, and Dhar was used. The measurements of body composition characteristics were done with the help of Body Composition Monitor having Scale HBF-361. To find out the relationship of body composition and emotional intelligence with competition performance, product moment co-efficient of correlation method was applied. To determine the significance of difference between means of high achievers and low achievers researcher's applied independent 't' test. The results indicated that there is a significant and negative correlation of competition performance with body mass index and emotional intelligence among the 100m sprinters, and shown insignificant relationship with body fat percentage, skeletal muscle mass, visceral fat and basal metabolic rate. Findings further revealed that high achievers sprinters were significantly possessed lesser body fat percentage and visceral fat, and greater skeletal muscle mass as compared to low achievers 100m sprinters. It has been also found that high achievers 100m sprinters were significantly emotionally more intelligent as compared to low achievers. However, in case of BMI and basal metabolic rate they do not show significant difference between them.

Keywords : Body composition, Emotional intelligence, Competition performance and sprinters.

Introduction

Sprint running includes several athletic events, in which the distance to be covered is equal to or less than 400 m. In particular, the 100 m races are among the most popular since they are part of the official Summer Olympics program. Even if sprint running has been extensively evaluated in biomechanical terms (Hunter JP et al. 2004 and Slawinski J et al. 2010), there is a need of focus on the possible correlation between anthropometry, emotional intelligence with performances.

Body composition is a significant part, of physical wellness and in making competitor's profiles and conditioning programs. It consists of fat and fat free mass. Notwithstanding, numerous multiple times substantially more time is spent on expanding the physical fitness of competitors without thinking about of their body organization and healthful status (Popovic et al., 2013). High body mass, whether it is due to increased body fat or decreased lean body mass affects aerobic performance. Kiflu et al (2012) reported that sports performance such as speed, endurance and jumping ability are all negatively affected by a high level of relative fat in the body. Weyand and Davis (2005) differentiate athletes on the basis of competing in different distances and found an inverse relationship between running distance and body mass index (BMI). Among the sprinters of same stature and body fat ratio, having a generally enormous body weight seems to enhance running performance, proposing that

Existential Ironies and the Dictates of Bureaucracy: A Study of Franz Kafka's *The Metamorphosis*

Dr. Prem Lata Chandra,
Associate Professor in German,
Department of Modern European and Other Foreign Languages,
Himachal Pradesh University, Shimla

DECLARATION: I AS AN AUTHOR OF THIS PAPER / ARTICLE, HEREBY DECLARE THAT THE PAPER SUBMITTED BY ME FOR PUBLICATION IN THE JOURNAL IS COMPLETELY MY OWN PAPER. In the literary lineages of Europe in the twentieth century, Franz Kafka has been acknowledged as the representative writer of existential thought. Kafka was not only aware of the long tradition of the philosophy, which examined the core concerns of human existence; rather he was well versed with the philosophical writings in this regard when he had embarked on writing. In his essay "Franz Kafka and Existentialism", Jay Ciaccio refers to Kafka's familiarity with Kierkegaard, who had philosophically articulated the issues of existentialism far earlier than the twentieth century existentialist philosophers, as follows: "Kafka had read Kierkegaard, identified with his ideas, and incorporated them in his work..." (Ciaccio, 77) Viewed from diverse perspectives, Kafka emerges as an existentialist writer who sought to give literary expression to the existentialist questions relating to guilt, freedom, absurdity, among others. More often than not, Kafka has hence also been studied in a comparative framework placing him vis-à-vis Dostoyevsky, Albert Camus, and Samuel Beckett. Jay Ciaccio remarks about Kafka: "However, no author has portrayed existentialism as clearly and creatively as Franz Kafka...A great many of his stories revolve around man's existence and its meaning, or lack thereof, and his characters endure punishment without ever understanding the nature of their guilt..." (Ciaccio, 77) Kafka's long story "The Metamorphosis" portrays many strains of the existential anguish and irony. Identifying this story as an epitomic representation of the existential literature, Ciaccio underlines: "Perhaps no other story so clearly displays Kafka as an existentialist writer than "The Metamorphosis"." (Ciaccio, 77)

The idea of absurdity constitutes one among many notions which the existential thought is based upon. Kierkegaard attempted to use the idea of absurdity philosophically and at many places in his narratives, Kafka undertakes to represent the absurdity which surrounds and confounds the reality of human life. Jay Ciaccio comments: "Kierkegaard frequently asserted his belief in the absurdity of the world, and

Kafka employed this notion in his art. The concept of absurdity is one of the elements which seems to unify all his works, and is indeed the most recognizable aspect of his style." (Ciaccio, 77) The notion of absurdity has been well articulated by Kafka in his story "The Metamorphosis". Jay Ciaccio points out: "The absurdity of "The Metamorphosis" is what first grabs the reader's attention. "As Gregor Samsa awoke one morning from uneasy dreams he found himself transformed in his bed into a giant insect." (Kafka 854) Within the first sentence of the story Kafka has transported us to the world of the absurd. All that is familiar and known to us is discarded, and a dream logic now prevails." (Ciaccio, 77)

A dream-like consciousness of reality underscores the idea of absurdity. Gregor Samsa, the protagonist of *The Metamorphosis*, has suddenly changed into a huge insect and like any other human being he resists believing this transformation. The dream-like element in this transformation baffles him, for he does not want to accept it. It appears even 'non-sense' to him to find himself so totally changed. He tells himself: "How about if I sleep a little bit longer and forget all this nonsense..." (Kafka, 16) He asks himself: "What's happened to me?...It wasn't a dream." (Kafka, 15) Even though awareness lingers in him not to believe this dream-like reality, he has no escape from it and he is consigned to accept this non-sense, this dream thwarting all rational notions about the reality. Along with this incredible transformation comes a conflict of perceptions about the self. He finds himself lying hapless as an insect in the bed, but the urgency of catching the early morning train to his firm has held him in grip. The animal existence and the human existence merge into his confused consciousness of the self. He thinks: "First of all though, I've got to get up, my train leaves at five." (Kafka, 17) The strenuous effort to arrange the strain emerging from the baffled state of his being, when he swings between the animal existence of an insect struggling hard to get down from his bed and the human state of being conscious about reporting punctually at his firm, characterizes the absurdity which stares Gregor Samsa in his face. The confusion and perplexity has been transported to the level of his consciousness of time also. He used to get up in time daily hearing the loud sound of the alarm-clock. When he looks at the alarm-clock, which shows that it was half-past six, the sense of confusion, perplexity and doubt overpowers him all of a sudden. He is at a loss to state categorically to himself whether he could really have overheard the loud sound of the alarm-clock. His predicament, however, lies also in his inability to be sure about the soundness of the sleep and he seeks to attribute his being late in waking up to this non-ordinary inability. Kafka writes about Gregor Samsa's perplexed and absurd condition: "It was half-past six and the hands were quietly moving forward, it was even later than half past six, more like quarter to

seven. Had the alarm clock not rung? He could see from the bed that it had been set for four o'clock as it should have been; it certainly must have rung. Yes, but was it possible to quietly sleep through that furniture-rattling noise? True, he had not slept peacefully, but probably all the more deeply because of that?" (Kafka, 18) Being forced to see the complex and confounding interrelation between the 'apparent' and the 'actual' reality underlines the absurd in the story.

The pain about the sorrowful state of the self, which is entangled in the disassociation between the 'real' and the 'doubt on the real', highlights the anguish of an absurd existence, which Gregor Samsa is exposed to suddenly. While he is yet in the bed and planning to get down, his mother comes to him and reminds him of catching the morning-train. He answers to his mother, but doing so he is terrified to hear his own voice, which sounds somehow unfamiliar to him. Thus, the flux-like consciousness takes him in its stride and he yields to it. Kafka describes this situation: ""Gregor," somebody called-it was his mother-"it's quarter to seven. Didn't you want to go somewhere?" That gentle voice! Gregor was shocked when he heard his own voice answering, it could hardly be recognized as the voice he had had before. As if from deep inside him, there was a painful and uncontrollable squeaking mixed in with it, the words could be made out at first but then there was a sort of echo which made them unclear, leaving the hearer unsure whether he had heard properly or not." (Kafka, 19) The fleeting line of demarcation between the 'appearance' and 'reality' so deeply jolts Gregor Samsa that the idea of restoring the apparent illusory sensibilities to reality constantly crosses through his mind. Sensing the appearance to be illusory and trying to be able to restore it to normalcy constitutes yet another dimension of the absurd in this story. Explicating the situation of Gregor Samsa in such a quagmire, Kafka writes: "At times like this he would direct his eyes to the window and look out as clearly as he could, but unfortunately, even the other side of the narrow street was enveloped in morning fog and the view had little confidence or cheer to offer him. "Seven o'clock, already," he said to himself when the clock struck again, "seven o'clock, and there's still a fog like this." And he lay there quietly a while longer, breathing lightly as if he perhaps expected the total stillness to bring things back to their real and natural state." (Kafka, 23)

Through this story Kafka has also tried to uncover the insensitiveness of the bureaucratic machinery, which always seeks to ignore the truthfulness behind the painful human existence. Kafka describes how the delay in catching the morning train led to the arrival of the chief clerk to the house of Gregor Samsa.

While Gregor was still trying his hard to move himself in his bed and get down from his bed, his sister comes close to his door to inform him that the chief clerk had come to meet him only. Kafka describes, from the right-hand room his sister was whispering to inform him of the situation: "Gregor, the chief clerk is here."(Kafka, 25-26) Not only is his sister, his father also worried to see the clerk who had come to know about the delay in the departure of Gregor. His father approaches from the other side to his room to intimate him about the inquiring clerk. Kafka describes: ""Gregor," said his father now from the left-hand room, "the chief clerk has come round and wants to know why you didn't leave on the early train." (Kafka, 26) Sudden, though purposed arrival of a bureaucratic-superior to his house unsettles the family-members of Gregor and they come out with the excuses concerning the delay in the departure of Gregor to his office that day. Both, mother and father of Gregor plead before the chief clerk that Gregor has not been well. In the words of Kafka: ""He isn't well," said his mother to the chief clerk,, while his father continued to speakthrough the door. "He isn't well, please believe me. Why else would Gregor have missed a train! The ladonly ever thinks about the business." (Kafka, 26) Gregor's sister grows sad and skeptic about the future of the financial stability of the family as a fall-out of the event. She starts crying in her room, which can be heard by Gregor. Gregor reflects on her crying: "And why was she crying? Was it because he had not got up, and had not let the chief clerk in, because he was in danger of losing his job, and if that happened his boss would once more pursue their parents with the same demands as before?" (Kafka, 27)

In a bureaucratic-machinery, which is based on the division and stratification of positions, one person is always at the receiving end. In this story, Kafka has described how Gregor stands at the receiving end. The chief clerk dictates the terms and asserts that slight inconveniences must not obstruct the professional goals of the official duties. The fact that Gregor is not well does not concern him at core and he constantly reminds Gregor of the official tasks and assignments awaiting disposal in the firm. He does not want to take Gregor's inability to catch the early train seriously. He tells Gregor's mother indifferently: "Well I can't think of any other way of explaining it, Mrs. Samsa...I hope it's nothing serious. But on the other hand, I must say that we people in commerce ever become slightly unwell then, fortunately or unfortunately as you like, we simply have to overcome it because of business considerations." (Kafka, 27) Behind these words lurks the sheer insistence on the sanctity of bureaucratic rules governing the terms of employment in the firm and the same is brought to the notice of Gregor when the clerk turns to Gregor in conversation. Kafka describes how the clerk addresses to

Gregor: ""Mr. Samsa," the chief clerk called now in a lower voice, "what is wrong? You barricade yourself in your room, give us no more than yes or no for an answer...and...you fail to carry out your business duties in a way that is quite unheard of." (Kafka, 28) So, Gregor's real inability to go office that day is an illustration of 'neglecting business duties' in the eyes of the clerk, as is so common a practice in a bureaucratic set-up which is not only based on inequality, rather also on the very legitimation of that inequality. The chief-clerk continues his conversation to Gregor and he wants an explanation from Gregor for his inability to go office: "I'm speaking here on behalf of your parents and of your employer, and really must request a clear and immediate and explanation...This morning, your employer did suggest a possible reason for your failure to appear, it's true-it had to do with the money that wasrecently entrusted to you-but I came near to giving him my word of honor that that could not be the right explanation. But now that I see your incomprehensible stubbornness I no longer feel any wish whatsoever to intercede on your behalf. And nor is your position all that secure...Your turnover has been very unsatisfactory of late." (Kafka, 29) Precisely because Gregor's family is laden with debt, the clerk has liked to associate his absence from office with the cash-payments entrusted to Gregor. A doubt financial in nature has been cast on Gregor with reference to the indebtedness of his family. Through this story, Kafka reveals how bureaucracy turns blind eye to the misery of the people expecting nothing other than unswerving professional commitment to the duties of the office.

The existential analysis of this story would entail a study of the reflection of Kafka on the issue of alienation through the narrative centering on Gregor Samsa. Charles I. Glicksberg stated about the interrelation between existentialism and the theme of alienation: "Existentialism expresses the alienation of modern man, his spiritually orphaned state, his incapacity to make any viable affirmations." (Glicksberg, 233) In *The Metamorphosis*, the transformation of Gregor into an insect is not only indicative of the inability of Gregor to humanly bear the pains and suffering of human existence, rather it also marks the beginning of a yawning gap between him and other human beings around him, as his existence means now an animal existence. This moment is the inauguration of the wretchedness of the alienation which slowly separates him from the others, even from his own family members. When Gregor unlocks his door and appears before his family members and the chief-clerk who has come to inquire about his delay, all are shocked to see him struggling as an insect on the floor. Gregor pleads to the chief-clerk, invoking him to empathize with his condemned condition: "Please, don't go away, at least first say something to show that you grant that I'm at least partly right." (Kafka, 36) The possibility

of empathizing with Gregor gradually dwindles with all. The chief-clerk separates himself from Gregor and leaves the room to get out of the house where Gregor lives. Kafka describes: "But the chief clerk had turned away as soon as Gregor had started to speak, and with protruding lips, only stared back at him over his trembling shoulders as he left." (Kafka, 36)

No one else than Gregor understands that it is the accumulated anxieties, pains and complaints over the years which has incapacitated him to exist as the human being and even though he can think and speak, he must come to terms with the transformation which has occurred unbelievably to him. Putting across his opinion about his sorrowful state to the chief-clerk, he says: "And you're also well aware that we travellers spend almost the whole year away from the office, so that we can very easily fall victim to gossip and chance and groundless complaints, and it's almost impossible to defend yourself from that sort of thing, or if at all it's when we arrive back home exhausted from a trip, and that's when we feel the harmful effects of what's been going on without even knowing what caused them." (Kafka, 36) Gregor's transformation entailed that he could not be understood by his words. His attempt to communicate fails, his sister wonders at his voice and she implores her mother to send for the doctor. Kafka narrates ""Mother?" his sister called from the other side..." You'll have to go for the doctor straight away. Gregor is ill...Did you hear the way Gregor spoke just now?" (Kafka, 31) And in an indifferent gesture, as if Greor is none to him anymore, the chief-clerk confirmed: "That was the voice of an animal..." (Kafka, 31).

The pangs of alienation became all the more clear to Gregor, when he realized the melting away of the emotional affection of his father towards him. His father was panicked the way the chief-clerk had swiftly left the house. His father thumped his feet and drove Gregor back to his room. Kafka depicts this growing distance between Gregor and his father: "The flight of the chief clerk seemed, unfortunately, to put Gregor's father into a panic as well. Until then he had been relatively self controlled, but now, instead of running after the chief clerk himself, or at least not impeding Gregor as he ran after him, Gregor's father seized the chief clerk's stick in his right hand,...picked up a large newspaper from the table with his left, and used them to drive Gregor back into his room, stamping his foot at him as he went. Gregor's appeals to his father were of no help, his appeals were simply not understood, however much he humbly turned his head his father merely stamped his foot all the harder." (Kafka, 39) At this point of time, Gregor became fully cognizant of the total alienation from his family members and others

around him. He reflected: "The previous morning while the doors were locked everyone had wanted to get in there to him, but now, now that he had opened up one of the doors and the other had clearly been unlocked sometime during the day, no-one came, and the keys were in the other sides." (Kafka, 44)

The idea of freedom is closely related to the existential consciousness. Jay Ciaccio comments: "For a man to truly exist, as Sartre believed, he must assert his freedom." (Ciaccio, 78) In the story *The Metamorphosis*, Gregor Samsa is led to live a sense of freedom out of love for the other. Otherwise confined to his room as an insect, he inches towards the living room exercising big effort just to see his sister Grete playing violin. Music draws him out from the dinginess of darkness, but more so his intense desire to see his sister playing on the notes of violin. Kafka describes: "His sister began to play; father and mother paid close attention, one on each side, to the movements of her hand. Drawn in by the playing, Gregor had dared to come forward a little and already had his head in the living room." (Kafka, 83) Quite often, the confines of his room pressed hard against Gregor's conception of free space devoid of choking limitations. He would prefer shifting his chair close to window and look out into the open from the window, and thus gain a sense of freedom. Kafka narrates: "He would often lie there the whole night through, not sleeping a wink but scratching at the leather for hours on end. Or he might go to all the effort of pushing a chair to the window, climbing up onto the sill and, popped up in the chair, leaning on the window to stare out of it. He had used to feel a great sense of freedom from doing this..." (Kafka, 54) Some critics, for example Jay Ciaccio, have argued that in this story, Gregor also tries to come into the way of the freedom of others. Jay Ciaccio argues: "In Gregor Samsa we see a man whose mere notion of freedom is utterly distorted. He not only misconstrues his own freedom, but that of others, as can be seen in his desire to possess his sister: "He would never let her out of his room, at least, not so long as he lived..." (Ciaccio, 78) But one must not lose sight of Gregor's desire to let the capabilities of his sister fully blossoming. In possessing such a desire, he retains within himself a sense of responsibility to ensure free development of the potentials to his sister. A person aware of such responsibility must also know the worth of freedom. Kafka writes about Gregor who wanted Grete to visit conservatory: "He never wanted to let her out of his room...She would sit beside him on the couch with her ear bent down to him while he told her how he had always intended to send her to the conservatory." (Kafka, 85)

Abstract

The measurement of density, speed of sound and viscosity of an amino acid and its dipeptide i.e., glycine and glycylglycine in aqueous solution of antibiotic drug cefepime has been carried out at various temperatures. The density and speed of sound data has been used to obtain partial molar volume(V_φ^o) , partial molar expansion coefficient($\frac{\partial V_\varphi^o}{\partial T}$)$_p$, second derivative($\frac{\partial^2 V_\varphi^o}{\partial T^2}$)$_p$, hydration number ($\eta_H$), isentropic compressibility(κ_s), partial molar isentropic compressibility($\kappa_{\varphi,s}^o$), partial molar volume of transfer($\Delta_{tr}\ V_\varphi^o$) and partial molar isentropic compressibility of transfer($\Delta_{tr}\ \kappa_{\varphi,s}^o$) . The viscosity data have been used to calculate the viscosity B–coefficients, its temperature derivative dB/dT, viscosity B–coefficient of transfer ($\Delta_{tr}\ B$) and various thermodynamic parameters of activation of viscous flow i.e., $\Delta\ \mu_1^{o*}$, $\Delta\ \mu_2^{o*}$, $\Delta\ S_2^{o*}$ and $\Delta\ H_2^{o*}$ for amino acid/peptide in cefepime solutions. The dependence of these parameters upon concentration and temperature clearly suggests the role of amino acid/peptide and cefepime in solute-solvent interactions.

ABSTRACT

Aggregation mechanism of two structurally different bile salts (bio-surfactants) in the absence and presence of drugs has been analysed through a conventional technique i.e. surface tension measurement. The anionic bile salts, namely sodium cholate (NaC) and sodium deoxycholate (NaDC), have been used to accomplish this study in the presence of metformin hydrochloride (anti-diabetic drug) and ceftriaxone sodium (antibiotic drug). The effect of hydrophobicity of the constituents and temperature has been analysed by carrying out surface tension measurement at different temperatures and various concentrations of both the components. The results of surface tension measurements have been interpreted in terms of various interactions that may be present in the system and the alteration in micellar behaviour of bile salts has been discussed by determining their critical micelle concentration (*CMC).* Moreover, the information on energetic micellasaion has also been grasped from various thermodynamic parameters evaluated for the system. The study may be considered to be a step to help pharmaceutical industries in terms of utilisation of cholanology to defeat solubility/permeability complications during drug formulations.

Abstract

Interactional behavior of bile salts, namely, sodium cholate (NaC) and sodium deoxycholate (NaDC), in the presence of an antibiotic drug, ceftriaxone sodium (Cft-Na), at different temperatures has been analyzed through volumetric, compressibility, viscometric, and proton nuclear magnetic resonance (^{1}H-NMR) studies. The volumetric and compressibility parameters have been calculated with the help of measured density (ρ) and speed of sound (u). Also, the knowledge on intermolecular interactions present in a ternary system consisting of bile salts in aqueous solution of drug has been procured from viscometric measurements. The variation in strength of the present intermolecular interactions in the system with temperature and concentration has been analyzed by carrying out the experiments at different temperatures, i.e., 293.15, 298.15, 303.15, 308.15, and 313.15 K, and drug concentrations, i.e., 0.005, 0.010, and 0.050 mol·kg^{-1}. The results have been interpreted by considering the cosphere overlap model, which confirm the presence of hydrophobic and hydrophilic interactions in the system. Also, the information obtained from density, speed of sound, and viscometric studies has been strengthened by analyzing the ^{1}H-NMR spectra. The study may be helpful in utilization of bile salts in pharmaceutical industries as a penetration enhancer.

SUBJECTS: Color, Colorimetry, Fluorescence, Ions, Sensors

Abstract

Nanocellulose has emerged as the most promising sustainable nanomaterial to develop cost-effective smart materials for various applications with consequential positive environmental impact. In the present study, we report spherical nanocellulose (SNC) modified with diethylenetriamine (DETA) and/or ethanolamine (EA) (SNC-DETA, SNC-EA, and SNC-DETA-EA) as Cu^{2+} ion sensors. Structure dependence of the sensing properties is the highlight of this work, as SNC-DETA-EA and SNC-DETA showed colorimetric naked-eye and fluorescent activity, with the former showing the same at very low ion concentrations with high selectivity, whereas SNC-EA lacked the same. The solution color changed rapidly to deep blue, and the fluorescence intensity was quenched when the ion concentration increased in the range 0.5–100 ppm, thus facilitating dual-channel ion detection. SNC-DETA-EA showed 1.03 ppm or a 1.622×10^{-5} M limit of detection and high Cu^{2+} ion uptake with maximum Langmuir capacity (q_m) of 212.76 mg/g.

Highlights

- Carrier-free urease immobilization was carried out using crosslinking method.
- Crosslinked urease was converted into their nanoaggregates (CLUNAs).
- CLUNAs have high activity, stability to temperature and pH variation than free form.
- Nanoaggregates have high storage stability and reusability up to 10 repeat cycles.
- Nanoaggregates effectively bio degrade isoproturone, a herbicide.

Abstract

Bioremediation is the most effective green protocol for degradation of environmental contaminants. Present study involves carrier free urease immobilization with synthesis of its new crosslinked aggregates using two different crosslinkers, divinyl benzene (DVB) and tripropyleneglycol dimethacrylate (TPGDA) via free radical mechanism. Resulting crosslinked ureases were further converted to nanoform (CLUNAs) using solvent evaporation technique. The activity of free and the crosslinked ureases was studied as a function of operational parameters viz. temperature (20–80), pH (2–11) and substrate concentration (5–20 mM) using urea as substrate at contact time of 10 min. Storability study of the pristine urease and CLUNAs was carried out for 40 days, and the CLUNAs were reused in 10 repeat cycles to assess their reusability. Isoproturone degradation was studied under the above-cited range of pH and temperature and results were recorded after 24 h.

Abstract

The micellar behaviour of two bio-surfactants, namely sodium cholate (NaC) and sodium deoxycholate (NaDC) in the presence of antibiotic drug viz. ceftriaxone sodium (Cft-Na) has been characterized physicochemically. The aim has been achieved via utilizing conventional conductivity and spectroscopic techniques i.e. UV–Vis and fluorescence probe studies. The knowledge on the alteration in the aggregation mechanism of the studied bile salts induced by Cft-Na has been accessed by means of determining one of the most promising parameters of micellar system called critical micelle concentration *(CMC)* from conductivity studies. The applicability and acceptability of this conventional technique has been confirmed by determining *CMC* with the help of modern spectroscopic techniques i.e. UV–Vis and fluorescence studies. The effect of temperature and drug concentration has also been analyzed by carrying out the studies at different temperatures and concentrations. The variation in the *CMC* and thermodynamic parameters calculated for the ternary (water + drug + NaC/NaDC) system has been elucidated in terms of assorted interactions that are present in the system by making use of charged pseudo-phase separation model. The spontaneity in micellization has been found in the presence of drug for the present system. The results of this study are relevant to pharmaceutical industries.

Introduction

Pharmacological action of drug is observed when it becomes available to the body by means of its absorption from the gastrointestinal tract (GIT). However, the physiological action of the drug i.e. pharmacokinetic and pharmacodynamic depends upon various factors such as physical state of the drug, route of administration including the anatomic and physiological nature of the application site, desired pharmacodynamic effect, the physicochemical properties of the drug molecule, nature of the excipients of the product and method of manufacturing etc. In addition, drug absorption is known to depend strongly upon the interplay between solubility, the dissolution rate and permeability of the drug molecules. The drug molecules may have high/low permeability and solubility in body fluids [1]. Moreover, the extent of drug absorption/bioavailability is greatly influenced by the administration route. Of the main drug administration routes such as injection or oral; the latter one is the most common and used more frequently. For drugs in tablet or capsule form, there are two distinct processes associated with absorption: dissolution and permeation across intestinal membrane depending on the relative magnitude of rate of these processes. However, poor drug solubility in gastrointestinal tract and hence, its low absorption/permeability into the cell membrane is a complex phenomenon [2]. The aforesaid facts advocate that drug solubility and permeability in body fluids should be reasonable in order to achieve significant pharmacological action of drug. Hence, it becomes not only extremely crucial but also equally important to overcome solubility/permeability problem of drugs so as to formulate better pharmaceutical formulation and ultimately, improve drug therapy.

It is, therefore, critical in modern pharmaceutical development to utilize drug solubility-enhancement technologies or methods to ensure better therapeutic effect of those drugs that are having low solubility/permeability in body fluids. In this regard, pharmaceutical professionals use different modes such as the utilization of inclusion of bio-compatible compounds like cyclodextrin, surfactant/bio-surfactant (bile salt) micelles, microemulsions or liposome formulations in drug procreation to overcome permeability and solubility issues [3,4]. Of these, however, bile salt micelles are used most frequently, and have gained

significant attention [5]. Micelles, aggregated structures of the amphiphilic molecules such as surfactants that are formed at a minimum surfactant concentration called critical micelle concentration *(CMC)* possess remarkable physicochemical properties like morphology, size, thermal and kinetic stability etc. The process of formation of micelles (micellization) has been known to alter by varying experimental conditions like temperature, pressure, pH, ionic strength of solution, presence of foreign substances like electrolytes, bio-molecules (carbohydrate, amino acid, protein etc.), drugs, surfactants/bio-surfactants, co-solvents etc. [[6], [7], [8], [9], [10], [11], [12], [13]]. Interestingly, the hydrophobic nature of micelles (interior) is responsible for the fact that they may be used in drug delivery as solubility/permeability enhancer. Thus, it would be interesting to characterize drug-bile salt system so as to make use of cholanology (bile salts) in pharmaceutical science by carrying out physicochemical studies on drug-bile salt system.

Bile salts/acids/biosurfactants are naturally occurring amphiphilic molecules present in vertebrates, including humans. The bile salts are obtained as the main products of cholesterol metabolism in the liver, stored in the gallbladder and then secretions are poured through the bile duct in intestine [14]. Structurally, they possess rigid steroid rings with methyl groups that constitute hydrophobic (convex) surface on one side whereas, stretchy segment with hydroxyl groups giving rise to hydrophilic (concave) facade [[15], [16], [17]]. The unique structure of bile salt encourages them to aggregate (micelle formation) with different shapes through different mechanism. The primary and secondary model as put forward by Small [18] that invokes stepwise aggregation of bile salts is most widely accepted model. In addition to this, Fisher's model suggested dimer formation, possessing rod-like structure [19]. Disc-like shape for bile salt aggregates has been recommended by Kawamura [20], and Warren [21], suggested a helical type shape for bile salts aggregate. Sodium cholate (NaC) and sodium deoxycholate (NaDC) (Scheme 1) that are sodium salts of cholic acid and deoxycholic acid respectively have been taken into consideration for this study in continuation to our previous reports [22,23] that may strengthen our knowledge on micellar mechanism of bile salts in drug-bile salts system by taking ceftriaxone sodium as model drug.

Ceftriaxone sodium (Cft-Na) (Scheme 2) is a third-generation cephalosporin antibiotic, and has broad-spectrum activity against Gram-positive and Gram-negative bacteria. It is often used for the treatment of community-acquired or mild-to-moderate healthcare-associated pneumonia and is also a choice for treatment of bacterial meningitis [24]. Chemically, (6*R*,7*R*)-7-[[(2Z)- (2-aminothiazol-4-yl)(methoxyimino)acetyl]amino]-3-[[(2-methyl-6-oxido-5-oxo-2,5-dihydro-1,2,4-triazin-3-yl)sulphanyl]methyl]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate, disodium salt, sesquatehydrate, with the chemical formula, $C_{18}H_{16}N_8Na_2O_7S_3$,3.5 H_2O, and a calculated molecular weight of 661.59g/mol. Ceftriaxone is a cephalosporin beta-lactam antibiotics used in the treatment of bacterial infections usually caused by susceptible, gram positive organism. Its antibacterial action is produced through the inhibition of bacterial cell synthesis [25]. Although wealth of literature is available on drug- bile salts system, but still it requires more elaborative knowledge on micellar behaviour of bile salts in such systems. The information procured from this study may be helpful in practicing and carrying out the safe trails of bile salts in new pharmaceutical formulation in future so as to conquer the solubility/bio-availability teething troubles in pharma-industries.

Section snippets

Material

The detail of chemicals used i.e. sodium cholate (NaC) and sodium deoxycholate (NaDC), ceftriaxone sodium (Cft-Na) and pyrene etc. have been given in Table 1. Both the bile salts have been used after re-crystallized from ethanol for carrying out experiments. The process followed for the re-crystallization has already been described in our previous paper [26], however, Cft-Na have been used as such without any pre-treatment. A.R. grade pyrene has been used as probe for analyzing fluorescence and …

Conductivity studies

The measurement of specific conductance, one of the best and highly efficient methods used for the elucidation of the process of micellization of amphiphiles has been used for the determination of critical micelle concentration *(CMC)* of bile salts in the presence of antibiotic drug. The *CMC* of sodium cholate and sodium deoxycholate in presence of Cft-Na has been determined by utilizing conductometry. The values of specific conductivity, κ for the experimented sample in 0.005, 0.010, and…

Conclusion

In the present communication, effect of antibiotic drug viz. ceftriaxone sodium (Cft-Na) on the miceller behaviour of bile salts namely sodium cholate (NaC) and sodium deoxycholate (NaDC) has been analyzed. The main outcome of the study is that the micellization of bile salts is greatly affected by temperature and drug content and is favoured in the presence of drug as can be publicized from the *CMC* values determined from conductivity, fluorescence and UV–Visible probe studies. The *CMC* values…

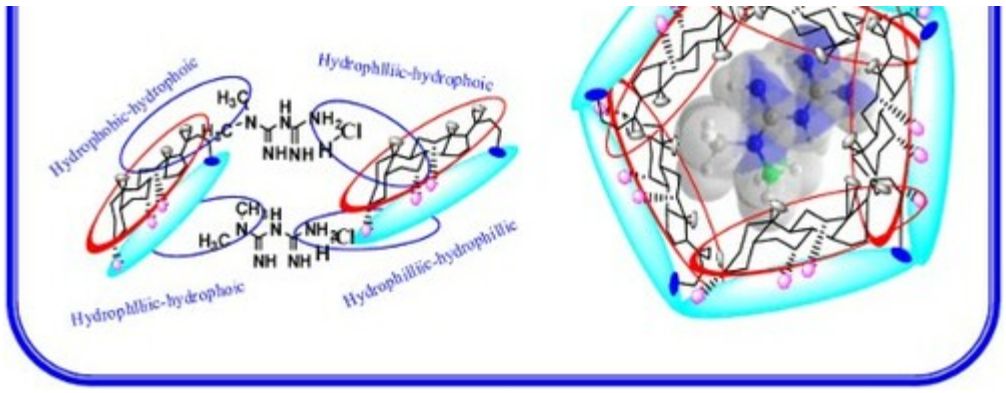
ABSTRACT



Aggregation mechanism of two structurally different bile salts (bio-surfactants) in the absence and presence of drugs has been analysed through a conventional technique i.e. surface tension measurement. The anionic bile salts, namely sodium cholate (NaC) and sodium deoxycholate (NaDC), have been used to accomplish this study in the presence of metformin hydrochloride (anti-diabetic drug) and ceftriaxone sodium (antibiotic drug). The effect of hydrophobicity of the constituents and temperature has been analysed by carrying out surface tension measurement at different temperatures and various concentrations of both the components. The results of surface tension measurements have been interpreted in terms of various interactions that may be present in the system and the alteration in micellar behaviour of bile salts has been discussed by determining their critical micelle concentration (*CMC).* Moreover, the information on energetic micellasaion has also been grasped from various thermodynamic parameters evaluated for the system. The study may be considered to be a step to help pharmaceutical industries in terms of utilisation of cholanology to defeat solubility/permeability complications during drug formulations.

Highlights

- Azadirachta indica –polyacrylamide hydrogels were pH responsive.
- Mesh size of hydrogel reduced at higher acrylamide content.
- The release of methyl prednisolone followed non-Fickian diffusion mechanism.
- The drug release profile was best fitted in Korsmeyer-Peppas kinetic model.
- The hydrogel showed non haemolytic, mucoadhesive and antioxidant nature.

Abstract

Herein this present work, graft copolymerization of the polyacrylamide onto azadirachta indica gum polysaccharide was carried out in the presence of crosslinker to form the interpenetrating network structure in hydrogels for use in biomedical applications. The crosslinked polymers were characterized by cryo-SEM, AFM, FTIR, and ^{13}C-NMR and swelling studies. The cryo SEM images confirmed the porous crosslinked network in polymers formed by covalent linkage. The change in polyacrylamide and crosslinker content during the formation of the gel has influenced the porosity which was inferred from the swelling and network parameter evaluation of the hydrogels. The cross linking density 0.81×10^{-5} molcm^{-3} and mesh size 63.0nm of hydrogels was found in pH 7.4 buffer. The methyl prednisolone released followed non-Fickian diffusion mechanism. The biocompatibility of grafted/crosslinked polymers was inferred from results of thrombogenicity (59.54 ± 4.08%) and haemolytic index (3.12 ± 0.52%). The antioxidant nature was confirmed from the DPPH radical scavenging assay (49.24 ± 8.57%). Overall, the modification of the gum led to the formation of hydrogels to be used in drug carrier for the colonic ailments.

1. Introduction

Typesetting math: 100% ica gum, commonly known as neem gum, is a natural exudate obtained from the azadirachta indica plant of

family Meliaceae. It is a complex hetero-polysaccharide which consist of glucosamine, mannose, arabinose, galactose, fucose, xylose and glucose (Vijayavaniand Vidyavati,2018). It has been used in various food and pharmaceutical formulations (Mukherjeeand Srivastava,1955). It is used as gelling agent (Ogunjimiand Alebiowu,2013), emulsifier (Rishabhaetal., 2017), antioxidant (Rishabhaetal., 2017), thickener and film forming agent (Kulkarnietal., 2013) in pharmaceutical formulations due to its water solubility and swell-able nature (Kouletal., 1990). It has been well recognized for anti-inflammatory and anti oxidant activity (Rouzeretal., 2009; Rishabhaetal., 2017). It increases viscosity of continuous phase, significantly reduces surface tension and improves the flow properties of the excipients (Rishabhaetal., 2017). It has also showed the substrate specific proteolytic activity under wide range of pH and temperature conditions (Nayaketal., 1979). Comparative analysis of physicochemical properties of gum obtained from India indicated that one gram of gum consists of moisture content (11.9–13.9%), specific optical rotation (-45^{O} to -62^{O}), nitrogen content (3.7–6.0%), protein (23.2–41.9%), uronic acid (28.3–31.4%), and the number average molecular weight of the gum was observed to be in the range from 5×10^{5} g/mol to 13.0×10^{5} g/mol (Moniemetal., 2018; Andersonand Hendrie,1971). The Azadirachta indica gum was obtained from Azadirachta indica trees and further processed it into powder for various applications (Moniemetal., 2018).

Graft copolymerization of the poly(AAm) onto gum polysaccharides has been reported for specialty applications (DaSilva etal., 2007; Monjezietal., 2018; Sharmaetal., 2018). During grafting reactions, addition of crosslinker has formed grafted crosslinked product that has been used as drug release vehicle (Maiaetal., 2012). These polymeric networks have been exploited for colonic drug delivery (Anjumetal., 2015). Nowadays, the site specific drug delivery carriers are well explored to facilitate the rapid onset and to minimize the side effects of the conventional formulations (Sardoetal., 2019).The drug loaded polysaccharide hydrogels has improved the colonic ailments by maintaining the concentration within therapeutic level for a long period beside several other advantages (Janaetal., 2019; Nayakand Hasnain,2019).These biodegradable gels have ability to hydrate that makes penetration of colonic fluid containing various digestive enzymes into drug formulation, degradation of the polysaccharide matrix and target specific drug release during the improvement in gastrointestinal tract (GIT) (Sinhaand Kumria,2001; Chourasiaand Jain,2004).These drug delivery carriers also provide the controlled and site specific drug delivery beside their colonic microbial degradation (Simonsenetal., 1995).

The polymers based drug delivery carriers prevent the dissolution of drug in the stomach until reaching the GIT due to their tunable composition and dissolution in GIT fluid (Guoetal., 2019). The Crohn's disease, ulcerative colitis and inflammatory bowel disease are some of the most common chronic inflammatory diseases associated with the GIT which have been treated with anti-inflammatory and immunosuppressive agents (Arbizuand Nurko,2015). Methyl prednisolone drug has also been used to treat these colonic ailments. It is a well known fact that colonic problems required long term treatment, therefore sustained drug delivery system of the methyl prednisolone is one of the options to reduce its negative aspects of its conventional drug formulations (Lautenschlageretal., 2014; Huanbuttaetal., 2016). In view of the above facts, in the present work, methyl prednisolone containing azadirachta indica gum polysaccharide and polyacrylamide based hydrogels have been designed as tune able colonic drug carrier by using graft copolymerization reactions.

2. Experimental

2.1. Materials and methods

Acrylamide (AAm) [Merck Specialties Pvt. Ltd., Mumbai-India], Ammonium persulfate (APS) [Fischer Scientific Mumbai India], NN-methylenebisacrylamide (NNMBA) [Acros Organics- New Jersey USA], and methyl prednisolone [Neon Laboratory Ltd. Mumbai India] were used as received. Azadirachta indica gum was obtained from the Neoteric DCBA Ideas Gandhipuram, Coimbatore, Tamil Nadu-India.

2.2. Synthesis of azadirachta indica-*cl*-poly(AAm) polymers

The synthesis of the azadirachta indica-cl-poly(AAm) polymers was carried out by free radical copolymerization method. The solution of known gum content (12.0% w/v) and monomer acrylamide [AAm] (1.13 mole/L) was mixed in the reaction system. Then the solutions of definite concentration of initiator ammonium persulfate [APS] (2.19×10^{-2} mole/L) and cross linker [NNMBA] (0.65×10^{-2} mole/L) were added to the reaction content containing gum and acrylamide solution. This reaction content was stirred at 110rpm speed at room temperature (28 ± 2^{O}C) to get homogeneous reaction mixture. The polymerization reaction was done at 65^{O}C for 3 h in water bath and then after completion of grafting/ crosslinking reaction, washing of polymers was carried out with distilled water to remove the soluble fractions left in the crosslinked polymer matrix followed by drying in air oven at 45 ± 1^{O}C to get constant weight. The crosslinked network structure of hydrogel with optimum porosity was obtained by varying the monomer [AAm] from 0.56 to 2.82 mole/L and crosslinker [NNMBA] from 0.65×10^{-2} –7.13×10^{-2} mole/L from the results of swelling, gel strength and surface morphologies of the hydrogel after 24 h of swelling. The optimum conditions were obtained as [AAm]=1.13 mole/L , and [NNMBA]=0.65×10^{-2} mole/L, gum=12% (w/v) and [APS]=2.19×10^{-2} mole/L. The grafting of the vinyl monomer onto gum was carried out and grafting efficiency was evaluated using following equation [Grafting efficiency

Typesetting math: 100%

(%)=(W_1-W_0)/W_2×100], wherein W_0 weight of gum, W_1 weight of grafted co-polymer and W_2 weight of acrylamide. In the case of azadirachta indica-cl-poly(AAm) based optimized polymer, grafting efficiency was observed to be 87.5%. The crosslinked product was formed by performing the grafting reaction in the presence of crosskinker NNMBA for designing the hydrogels for specialty applications.

2.3. Characterizations

The cross-linked azadirachta indica-cl-poly(AAm) polymer samples were characterized bycryo-SEM [Jeol (JSM 7600) scanning electron microscope (Japan)], AFM [AFM (NT-MDT, RUSSIA)], FTIR [Agilent K8002AA Carry 600 FTIR], and solid state ^{13}C-NMR [BRUKER DSX-300 solid state NMR spectrometer].

2.4. Swelling and network parameters studies

The swelling of azadirachta indica-cl-poly(AAm) hydrogels and network parameters including mesh size /cross-linking density were determined by taking swelling by applying gravimetric method (Singh,2007). Network parameters of hydrogels were evaluated from the swelling data using Flory-Rehner equation (Bajpaiand Singh,2006; Aithaletal., 1990).The brief procedure for the evaluation of Flory-Huggins interaction parameter (χ), and mesh size (ξ) of the hydrogelshas been discussed elsewhere (Singhand Singh,2017).

2.5. Drug release studies

The loading of drug methyl prednisolone into hydrogels was carried out in drug solution of definite concentration (500 micrograms/mL) by swelling equilibrium method(Singhand Singh,2017).The diffusion mechanism for swelling/drug release was evaluated using power law expression ($M_t/M_\infty=kt^n$) given by Ritger and Peppas (Ritgerand Peppas,1987a;b).The best fit kinetic model was evaluated by putting the release profile data in various kinetic models (Shoaibetal., 2006; Dashetal., 2010).The release of drug methyl prednisolone from drug encapsulated azadirachta indica-cl- poly(AAm) gel was determined from the reference curve of the drug using UV-visible spectrophotometer.

2.6. Blood compatibility studies

The blood compatibility of azadirachta indica-*cl*-poly(AAm) hydrogels was studied by evaluating thrombogenic and hemolytic potential (ISO 10993-4, TC 194, 2004; ASTM F 756-00, 2000). Thrombogenicity was determined by the evaluation of thrombus formation on polymer surface and test was carried out by the gravimetric method in triplicate.

$$\text{Thrombose}(\%) = \left[\frac{\text{Mass test sample} - \text{Mass of } (-) \text{ control}}{\text{Mass of } (+)\text{control} - \text{Mass of } (-) \text{ control}}\right]$$

Hemocompatibility testing is an imperative method for medical devices intended for direct or indirect blood exposure. The haemolytic potential of the material is defined as the measure of the extent of haemolysis that may be due to the material when it comes in contact with blood. The haemoglobin released by haemolysis was measured by the optical densities (OD) of the supernatants at max 540 nm using a UV–vis spectrophotometer.

$$\text{Haemolytic Index}\left[\frac{(\text{OD of sample} - \text{OD of negative control})}{(\text{OD of positive control} - \text{OD of negative control})}\right]$$

2.7. Antioxidant activity

Antioxidant activity of azadirachta indica-*cl*-poly(AAm) polymers was evaluated by 2,2 -diphenyl - 1 - picrylhydrazyl (DPPH) radical scavenging assay and Folin -Ciocalteu (F -C) reagent assay (Gorczycaetal., 2014; Curcioetal., 2009). In case of DPPH radical scavenging assay, 0.4 g of polymer sample was placed in methanolic solution (100 mM) of DPPH radical (as test experiment) and DPPH solution without polymer was taken as control. The reaction mixtures were kept in dark and the absorbance was measured at λmax 517 nm after 24 h using a UV-vis spectrophotometer. In F-C reagent assay, antioxidant capacity of polymer was expressed as gallic acid equivalent. Polymer sample of 0.1 g was placed in de-ionized water for 1 h and it was removed and fresh 6 mL water was added followed by 1 mL F-C reagent. After 3 min, 3 mL of 2% Na_2CO_3 was added and content was kept at 37 °C for 2 h with intermittent shaking. Absorbance was measured at λ_{max} 760 nm against control (treated similarly but without polymer). All the tests were carried out in triplicate.

$$\%\ \text{inhibition} = \left[\frac{\text{Control} - \text{Test}}{\text{Control}}\right] \times 100$$

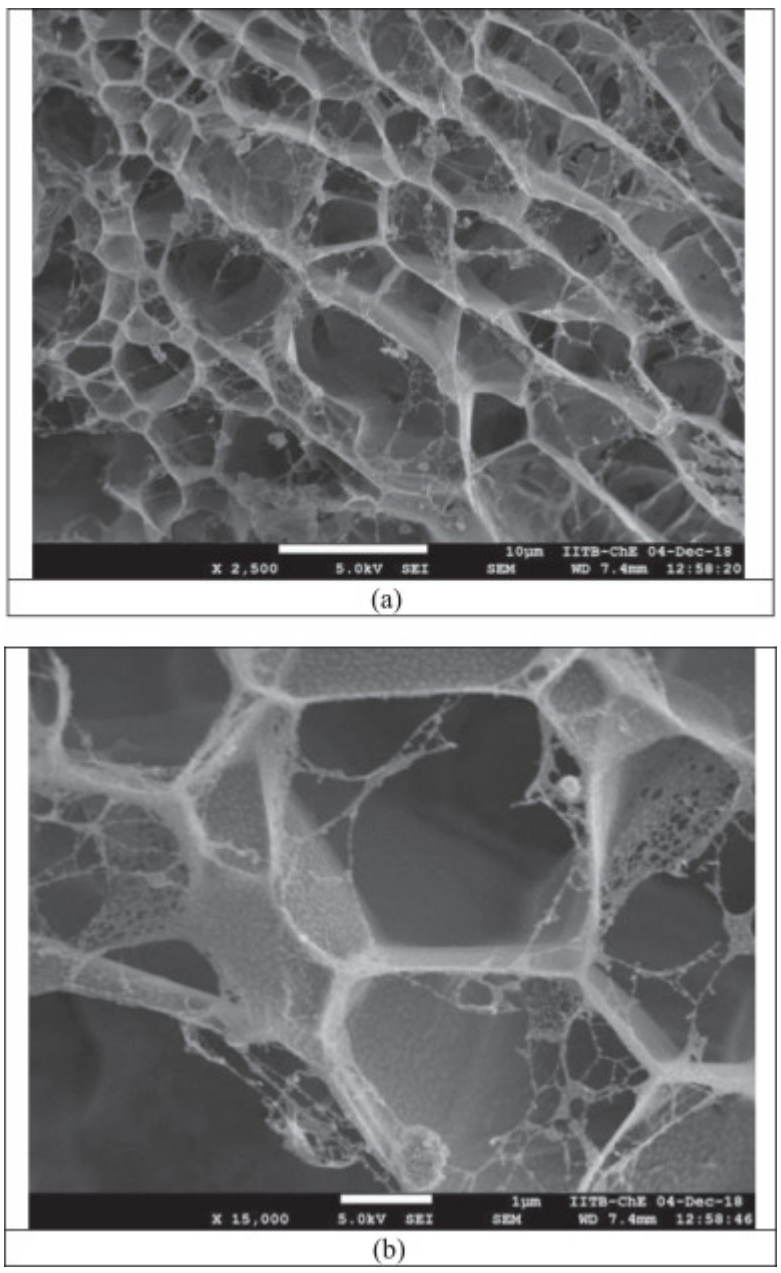
2.8. Mucoadhesion studies

Mucoadhesion of the azadirachta indica-*cl*-poly(AAm) hydrogel with the intestinal mucosa was analyzed by texture analyzer (Eouanietal., 2001). The tissue was equilibrated in simulated intestinal fluid for 15 min at 37 °C before placing it onto the holder

Typesetting math: 100%

stage of the mucoadhesive holder. The probe attached with polymer was then moved downward to make the contact with goat intestine mucosa with fixed time and contact force. The probe was subsequently withdrawn at a test speed 0.1 mm/s. The maximum force required to separate the probe from the goat mucosa (i.e. maximum detachment force; F_{max} in N) was directly recorded in the instrument and the total amount of force involved in the probe withdrawal from the tissue (work of adhesion; W_{ad}) was then calculated from the area under the force versus distance curve in N mm.

2.9. Gel strength of the hydrogels



Gel strength of azadirachta indica-*cl*-poly(AAm) was determined by texture analyzer.Gel strength was taken after 24 swelling of the crosslinked hydrogels. After a trigger force of 5 g was attained, the probe then proceeds to penetrate into the gel to a depth of 5 mm. At this depth, the maximum force reading (i.e. the resistance to penetration) was obtained as the 'gel strength' of the sample.

3. Results and discussion

3.1. Characterizations

3.1.1. Cryo-Scanning electron micrograph (Cryo-SEM)

The highly porous structural morphology of the swelled azadirachta indica-*cl*-poly(AAm) hydrogel was clearly visible in the Cryo-SEM images (Fig. 1). The different polymeric chains are crosslinked and network structure is formed. The porous nature of the polymer matrix is useful for drug delivery applications (Soleetal., 2019).

Fig. 1. Cryo-SEM images of swelled hydrogels at different magnifications ((a) 2500, (b) 15000) for 1 µm.

3.1.2. Atomic force microscopy (AFM)

The micromechanical properties of the azadirachta indica-*cl*-poly(AAm) polymer surface was examined through AFM image (Fig. 2). The appearance of small valleys in the form of crest and trough on the scanned area indicated structural heterogeneity in the polymeric sample. The polymer sample showed root mean square roughness 26.770 nm over an area (2×2 µm) while the average surface roughness was recorded as 19.032 nm (Benninatto etal., 2019).

Typesetting math: 100%

Fig. 2. AFM image of dry Azadirachta indica -*cl*-poly(AAm) polymer sample.

3.1.3. Fourier Transform Infrared spectra (FTIR)

FTIR of azadirachta indica gum and crosslinked hydrogels are shown in Fig.3. In case of FTIR of gum the absorption bands were observed at 3406 cm^{-1} (due to –OH stretching vibrations in the gum polysaccharide), at 2931 cm^{-1} (-C-H stretching mode of $-CH_3$ groups in the gum), at 2121 cm^{-1} (due to overtones of -C-O stretching vibrations), at 1738 cm^{-1} and 1627 cm^{-1} (due to C=O stretching vibrations of carboxylic acid and amide present in the gum). The absorption peaks at 1421 cm^{-1} (due to C-H deformation of methylene groups in the gum), and at 1248 cm^{-1} (due to C-O-C asymmetric stretching vibrations) were observed (Phadkeetal., 2015; Veluswamyetal., 2015). In case of FTIR of azadirachta indica-*cl*-poly(AAm) polymer, absorption bands at 3404 cm^{-1} (due to -OH stretching vibrations in the gum polysaccharide), at 2929 cm^{-1} (due to -C-H stretching mode of $-CH_3$ groups in the gum) and at 2154 cm^{-1} (due to overtones of -C-O stretching vibrations) were noticed. A broad band at 1668 cm^{-1} (due to overlap of -C=O stretching vibrations of free carboxylic acid of gum and -C=O stretching vibrations of amide linkage in the gum and poly(AAm)) were observed. The bands at 1452 and 1421 cm^{-1} (due to C-H deformation of methine and methylene groups present in gum and poyacrylamide), at 1353 and 1325 cm^{-1} (due to asymmetric/symmetric stretching vibrations of C-N functional group in the gum and poly(AAm)), were found along with the band at 1248 cm^{-1} (due to C-O-C asymmetric stretching vibrations) (Moharrametal., 1996; Veluswamyetal., 2015).

3.2. Swelling and network parameters studies

The effect of change in monomer (AAm) and crosslinker (NNMBA) concentration during copolymerization reaction on the mesh size and network density of the hydrogel matrix was evaluated by taking the swelling of the grafted product formed by varying the [AAm] (from 0.56–2.82 mole/L) (Fig. 5, Table 1).The swelling of the azadirachta indica-*cl*-poly(AAm) hydrogels first enhanced (from 4.58±0.47 to 6.27±0.21 g/g of gel) with rise in [AAm] (from 0.56 to 1.17 mole/L) in solution and thereafter swelling decreased with AAm content. The increase in monomer content after certain limit the further addition has increased the crosslinking density that reduced the water uptake by the polymer matrix.

16.	47 °C	0.60	1.33	02.81	0.54	03.22

The swelling of the hydrogels in general decreased due to increase in crosslinking density with the change in crosslinker [NNMBA]. Similarly, grafting reaction of monomer acrylamide onto chitosan along with the addition of NNMBA crosslinker formed hydrogels where the decrease in swelling with increase in crosslinker concentration was observed. At the same time higher content of NNMBA has not much influenced swelling due to rise in cross-linking and hydrophilicity simultaneously. This has also led to the competition between polymer-polymer interactions and polymer-solvent interactions. Swelling of hydrogels was found higher in pH 7.4 buffer (9.68±0.06g/g of gel) as compared to the pH 2.2 buffer (5.29±0.66g/g of gel) due to ionic repulsions among the ions formed after partial ionization of the polymer matrix in pH 7.4 buffer. Furthermore, the higher swelling at 45 °C temperature may be because of rise in segmental mobility and rate of diffusion. The diffusion exponent (swelling curve of water uptake vs time) indicated that hydrogels swelled with non-Fickian diffusion mechanism.

These swelling trends of hydrogels were also evident from the results of the network parameters wherein the value of the mesh size (ξ) reduced from 31.72 nm to 20.52 nm after forming the pore of optimum size with increase in [AAm] in the reaction system (Table 2). The increase in crosslink density (ρ) with rise in monomer content from 1.36×10^5 to 4.10×10^5 mol/cm^3 was also observed.At the same time the, values of the ρ increased (from 1.32×10^5 to 13.98×10^5 mol/cm^3) and ξ decreased (from 43.31 nm to 14.66 nm) with increase in [NNMBA]. The rise in crosslinks in the hydrogel has decreased the mesh size and molecular weight between two crosslinks that led to the decrease in the water content in the gel. The Flory Huggin interaction parameter gave an idea about the interaction of the hydrogel with solvent molecules. In the present study, it was observed that the values for Flory Huggin interaction parameter were less than 1 indicating the random arrangement of the water molecules in the network within the polymeric units. Similarly, it was observed that polymer volume fraction values were inversely proportional to mesh sizes of the polymer throughout experimental analysis. At higher pH and temperature of swelling medium, the cavitations in the polymer matrix increased and elasticity decreased (Lietal., 2006).

3.3. Drug release studies

The release profile of the methyl prednisolone from the drug containing polymers indicated the pH responsive behavior of the hydrogel during drug release studies in different pH buffers (Fig6.,Table3). The drug release results were corresponding to the swelling results of the hydrogels. The higher release of methyl prednisolone in 7.4 buffers was also on the basis of larger mesh size of the hydrogel (68.80nm) in 7.4 buffer as compared to the pH 2.2 pH buffer (i.e. 25.14nm). The drug loading into hydrogels used in drug release study was 57.44±5.52%.The results of the release profile also indicated the slow release of drug without burst effect in later stages. The methyl prednisolone drug released with non-Fickian diffusion wherein the rate of drug solvent and rate of polymer chain relaxation are almost same. Drug release profile was bested fitted in Korsmeyer Peppas kinetic Model from drug loaded polymers. Moradi etal. (Moradietal., 2020) have also reported similar type of kinetic model for the drug release from the chitosan based hydrogels. The slow controlled and sustained release of drug was due to various supramolecular interactions. Various drug polymer interactions present in the methyl prednisolone loaded azadirachta indica-cl-poly(AAm) hydrogels shown in scheme1.

Scheme 1. Various drug polymer interactions present in the methyl prednisolone loaded azadirachta indica-cl-poly(AAm) hydrogels.

It has also been reported that the azadirachta indica gum itself has anti-inflammatory effect due to inhibition activity of pro-inflammatory enzyme by its various constitute compounds that stop the synthesis of prostaglandins which is responsible for tissue inflammation (Tillayetal., 2001; Vijayavaniand vidyavanti,2018). Overall, various inflammations occurred in the colon will be taken care by the slow release of anti-inflammatory drug methyl prednisolone in the colon and microbial degradation of the gum in colon. Hence, this synergic effect of methyl prednisolone drug released from the drug carrier polymer and degradation of the polymer carrier in colon can enhance the therapeutic potential besides overcoming the side effect associated with its conventional drug formulations.

3.4. Blood compatibility studies

The results of the thrombogenicity showed that the weight of clot formed (0.197±0.03g per2mL) and thrombose percentage (59.54±4.08%) (Table4) showed non-thrombogenic nature of hydrogels and it is required for the material to be used in biomedical applications. Alexandre and coworkers (Alexandreetal., 2015) have also confirmed less thrombogenicity of the polysaccharide (dextran) based hydrogel as compared the glass.The haemolytic index value (3.12±0.514%.) was less than 5% that indicated safe nature of drug delivery carrier or biomaterials (Rayetal., 2010). Pectin based porous and non-porous polymers prepared for drug delivery application have showed thrombogenicity 76.93% and 74.79%, respectively and these polymers have been classified in non-thrombogenic nature of the matrials (Moghaddametal.(2019)). Moringa oleifera based polymer showed good biocompatibility due to non thrombogenic and non haemolytic nature. The hydrogel was found to have 33.33% thrombus formations and 1.8% haemolytic potentials (Parwanietal.2016). The results of hemolysis assay of chitosan based partially and fully crosslinked polymeric hydrogels showed hemolytic potential (1.82±0.07) and (1.60±0.007) respectively which has been found within the acceptable limit of 5% (Radhakrishnan,Jose, & Kurup,(2015). In another research report, xanthan gum based polymer composites

Typesetting math: 100%

showed haemolysis values less than 5%. Different factors such as hydrophilicity, chemical composition, surface topologies and morphologies have been observed for haemolytic potency of the dressing surface (Raafatetal.(2018).

Table 4. Results of thrombogenecity, haemolytic potential, antioxidant activity, mucoadhesion test, and gel strength of hydrogels.

Gel strength(Nmm)	5.11 ± 0.12	2.79 ± 0.24	1.12 ± 0.59

3.5. Antioxidant activity

The antioxidant activity in Folin–Ciocalteu (F-C) reagent assay showed antioxidant activity was 27.9±6.25µg gallic acid equivalent for polymer while from DPPH radical scavenging assay, it was 49.24±8.57% scavenging (Table4). Antioxidants scavenge excess free radicals and protect the biological system from oxidative damage. The antioxidant nature of the polymer samples was due to the presence of gum in the polymer matrix. The natural gums were also reported to have antioxidant properties (Nietal., 2019). Tang etal. (Tangetal.(2019)) have prepared alginate/PVA hydrogels and their antioxidant activity was observed 66±7% in DPPH radical scavenging assay. Antioxidant activity was due to the presence of large number of phenolic groups in the polysaccharide (Kaolaoretal.(2019)). Similarly inulin based polymeric hydrogels showed 74% antioxidant potential for DPPH assay (Spizzirrietal.(2011)). Natural polysaccharides have polyphenol with many hydroxyl groups in the structure. Experimental study showed that Azadirachta indica gum has compounds such as polyphenols that easily scavenged free radicals by deprotonation to a free radical in order to remove odd electron, which was responsible for the radical's reactivity (Malviya,Sharma, & Dubey. 2017).Similar enhancement in the antioxidant activity was also reported when other phenolic compounds such as proanthocyanidins were present in the gum polysaccharides (Raschipetal.2020).

3.6. Mucoadhesion studies

The gels mucoadhesion with intestinal mucus membrane showed peak detachment force (F_{max}) and work of adhesion 0.059±0.007N and 0.337±0.032Ns respectively (Table4). Thus hydrogels were mucoadhesive in nature that can improve the residence time of colonic drug carrier in colon (Kumaraswamyand Giri,2019).The use of mucoadhesive drug delivery is advantageous for controlled drug release at a specific site of the body. It has been confirmed that the mucosal membrane drug delivery carrier increase the residence time of the drug delivery device at the site that in turn make site

Typesetting math: 100%

specific drug release (Singhand Singh,2019). It has been found that higher extent of the crosslinking in the hydrogels improved mucoadhesion due to increase in forces of attraction between gels and mucosal membranes. On the other hands it has also been observed that in crosslinked polymer mucoadhesiveness was more as compared to individual polymers (Lietal.(2019)).

3.7. Gel strength of the hydrogels

The trends of the gel strength were corresponding to the swelling trends of the polymers but reverse in order i.e. higher swelled polymers with less strength. The reduction in gel strength was observed with increase in pH and temperature. Martín-Illana and coworkers (Martín-Illanaetal.(2019)) synthesized pectin, chitosan and hydroxypropylmethyl cellulose based gels. The results of the gel strength studies showed that the polymers show strength in the range 1.21±0.19 N to 6.48±0.26N used for drug delivery applications. Li and coworkers (Lietal., 2019) showed that higher crosslinking in the polymer enhance the gel strength due to increase in forces of attraction between various constituents present in the gel. They have also inferred that after grafting/crosslinking the gel strength of the backbone enhanced (Table4).

4. Conclusions

The modification of the azadirachta indica gum through graft co-polymerization in the presence of crosslinker has formed the crosslinked polymer network structure which was porous and it was confirmed from the cryo SEM images of the hydrogel. The content of the crosslinker NNMBA and monomer AAm during formation of the gel has influenced the porosity which was inferred from the swelling results of the hydrogel. Moreover, the network parameters like mesh size and crosslinking density was also supported this observation. The methyl prednisolone drug released polymers with non-Fickian diffusion mechanism without burst effect in slow manner and approached Korsmeyer-Peppas kinetic model. The biocompatibility of grafted gum was inferred from results of thrombogenicity (59.54±4.08%) and haemolytic (3.12±0.517%). The antioxidant nature was confirmed from the DPPH assay (49.24±8.57%). Overall, grafting of poly(AAm) onto gum has formed the hydrogels which could be applied in various biomedical applications including drug carrier for the colonic ailments.

Synthesis and Characterization of Psyllium Polysaccharide–Poly(2-hydroxypropyl methacrylate)–Poly(acrylamide) Hydrogels for Use in Sustained Drug Delivery Applications

Baljit Singh, Suresh Kumar, Rajneesh, Man Mohan & Divya

Polymer Science, Series B **62**, 685–696 (2020)

228 Accesses | Metrics

Abstract

Psyllium has been explored for various food and pharmaceutical applications. Recently, its therapeutic action against cancer has been reported. Hence, herein in this research it has been modified to develop hydrogels through graft copolymerization reaction for use as sustained drug delivery carriers for anti-cancer drug “5-fluorouracil” (FU) to enhance the therapeutic potential. Synthesis of hydrogels was carried out by grafting of poly(2-hydroxypropyl methacrylate) and poly(acrylamide) onto psyllium in the presence of crosslinker. Polymers were characterized by cryo-SEM, AFM, XRD, ^{13}C-NMR, and TGA techniques, beside evaluation of swelling, drug release, blood compatibility, mucoadhesion, antioxidant properties and gel strength of the hydrogels. The porous network structure with rough surface was observed in cryo-SEM and AFM images of the samples. Release of FU from psy-*cl*-poly(HPMA-co-AAm) polymer occurred with non-Fickian diffusion in sustained manner. These hydrogels were mucoadhesive (work of adhesion = 8.45 ± 0.32 N mm), non-haemolytic (haemolytic index = 1.05 ± 0.07%), and antioxidant (with 19.12 ± 0.14% inhibition in DPPH assay) in nature, therefore they could be used as slow drug delivery carriers for ailments associated GIT system.

Highlights

- Polysaccharide gels were obtained by graft polymerization technique.
- Gels showed pH responsive swelling and drug release.
- The composition of the PVP in the hydrogel influenced the porosity.
- Drug release occurred by non-Fickian diffusion mechanism and best fitted in Korsmeyer-Peppas kinetic model.
- Hydrogels showed mucoadhesive and non haemolytic behaviour.

Abstract

In this work, *graft*-copolymerization of poly vinylpyrollidone onto *Azadirachta indica* gum polysaccharide in the presence of crosslinker has been carried out to prepare the hydrogel for use in drug delivery. The polymers were characterized by cryo-SEM, AFM, FTIR, and ^{13}C NMR. The gel strength, cross-link density, mesh size, thrombogenicity, antioxidant and mucoadhesion properties of the gum-PVP hydrogels were determined along with the evaluation of drug release profile of methyl prednisolone, a colonic anti-inflammatory agent, from the drug loaded hydrogels. Cryo SEM images showed the porous crosslinked structure of the polymer network. The drug release from the polymer followed non-Fickian diffusion mechanism. The polymers showed 71.47 ± 4.63% haemo-compatibility and 05.52 ± 0.59 Nmm gel strength. The value of DPPH radical scavenging assay (73.16 ± 04.85%) indicated that the gum-PVP polymers are antioxidant. The results of biocompatibility, antioxidant activity, mucoadhesion and drug release properties of the polymers inferred the use of this drug carrier for colonic drug delivery.

The interactions in aqueous solutions of alanine, arginine, glutamine and histidine (0.02-0.20) mol·kg^{-1} in different concentrations of aqueous drug (0.001, 0.005, and 0.010) mol·kg^{-1} have been studied over temperature range 293.15 to 313.15 K with an interval of 5K by using density, speed of sound and viscosity measurements. The density and speed of sound data have been used to calculate various parameters viz. apparent molar volume, partial molar volume, apparent molar isentropic compressibility, partial molar isentropic compression etc. The density and speed of sound data have been used to calculate various parameters. These interactions have been interpreted in terms of the presence of different kinds of intermolecular interactions in (amikacin sulphate + water + amino acid) system i.e. ion-ion and ion-hydrophilic interactions, dominate over the ion-hydrophobic interactions. Moreover, viscosity data have been analyzed by employing Jones-Dole equation and information on solute-solute and solute-solvent interactions have been extracted. Also, transition state theory has been applied to evaluate thermodynamic activation parameters and more disordered transition state due to rupture and distortion of intermolecular forces in the system have been observed. For the studied ternary systems, the absorption spectra have also been recorded. Moreover, the amino acids act as efficient structure maker in amikacin sulphate solution.

Aggregation and Adsorption Behavior of Cationic Surfactants (Cetyltrimethylammonium Bromide and Dodecyltrimethylammonium Bromide) in Aqueous Solutions of Antibiotic Drug (Amikacin Sulphate) at Different Temperatures

Suvarcha Chauhan, Poonam Chaudhary, Vivek Sharma

First published: 25 September 2020 | https://doi.org/10.1002/jsde.12462 | Citations: 3

Abstract

Conductivity and spectroscopy techniques have been accomplished to comprehend the mechanism of supramolecular assembly of cetyltrimethylammonium bromide (CTAB) and dodecyltrimethylammonium bromide (DTAB) in aqueous solution of amikacin sulphate (0.001, 0.005, and 0.010 mol kg^{-1}). For CTAB, the normal boost of the CMC value with rise in temperature manifests the significant role of aquaphilic dehydration. However, the aquaphobic dehydrations become prominent with temperature and depict typical U-shaped behavior of CMC for DTAB. The thermodynamic parameters of micellization have been derived from CMC values. The outcomes have been conferred in terms of solvation of hydrophobic part of surfactants by hydrophobic part of amikacin sulphate and micellization becomes more favorable for surfactant with more hydrophobic character in the presence of drug. The alteration in micro-environment of the ternary (drug/surfactant/water) system has been explained in terms of fluorescence emission intensity of surfactant solutions which has been found to decrease by the addition of drug. The obtained absorbance spectrum by varying concentrations of surfactant/drug affords noteworthy information regarding the diverse interactions in studied systems. Moreover, the exhaustive understanding of surfactant micellar behavior have been discussed in consideration of use of surfactants as drug delivery agents and hence to amplify drug bioavailability consequently remodeling its treatment efficacy.

CARBOHYDRATE POLYMER TECHNOLOGIES AND APPLICATIONS (DEC 2021)

Designing moringa gum-sterculia gum-polyacrylamide hydrogel wound dressings for drug delivery applications

Baljit Singh, Vikrant Sharma, Rohit and Ajay Kumar

AFFILIATIONS +

Journal volume & issue
Vol. 2
p. 100062

Abstract

READ ONLINE

Herein this manuscript the potential of moringa gum and sterculia gum polysaccharides has been explored for developing the hydrogel wound dressing for better wound care. The polysaccharide gum and polyacrylamide network structure was formed through grafting and crosslinking polymerization. The cryo-SEM and AFM of the films indicated the porosity in the polymer films and roughness of the polymer surface. The polymers were also characterized by FTIR, and 13C NMR studies. The release of the antibiotic drug levofloxacin from polymer dressings occurred with non-Fickian diffusion mechanism. The blood compatibility, wound fluid absorption, antioxidant activity, mucoadhesion and mechanical properties were evaluated along with O2 and H2O permeability. The drug released fitted in Korsmeyer-Peppas kinetic model. The hydrogel films were permeable to O2 and H2O vapor and impermeable to microbes in open environment and showed high wound fluid absorption, mucoadhesion and antioxidant activity.

Abstract

As the brain injury causes persistent neurological disorders that lead to the loss of neuron functions. The blood–brain-barrier limits the bioavailability of drugs required in therapeutic level. Hydrogel dressing can provide the localized drug release to the injured brain tissues that can reduce the limitations of the other drug delivery formulations. In the present article, sterculia gum and alginate polysaccharides were explored to form hydrogel dressing by radiation method for use in brain drug delivery. These dressings were characterized by AFM, XRD, FTIR, and ^{13}C NMR. The content of the artificial cerebrospinal fluids absorbed by sterculia-alginate dressing was 19.60±0.35 g. The release of citicoline drug, a nerve regenerative agent, occurred in controlled manner through Fickian mechanism and followed first order kinetic model. The porous dressings were permeable to O_2 and H_2O and were biocompatible and antioxidant. Since the hydrogel dressings were prepared by radiation method so the resultant material was pure and sterile and could be explored for its application in brain drug delivery during brain injury.

Introduction

Brain injury is one of the persistent neurological disorders that lead to the loss of neuron cells, their functions, and interconnections. The repair of injured neurons is very complicated and offers numerous challenges. The low bioavailability of drugs to reach the brain due to the blood–brain-barrier (BBB) require high amount of drugs to patient in order to reach brain more efficiently [1]. Drug delivery localized into brain bypass BBB and increase drug dose to the cells in the brain and avoid systemic side effects [2], [3]. The blend hydrogels can provide localized drug release to the injured spinal cord [4]. Various polysaccharides based hydrogels have been applied in brain drug delivery devices due to their ability to deliver therapeutics directly into the brain and spinal cords [5]. Polysaccharides based hydrogels formed by the radiation method by the grafting of hydrophilic polymers onto

polysaccharide backbone are pure and additive free. The sterilization and synthesis of hydrogels occurred simultaneously and these hydrogels can be used can be used in biomedical applications. The crosslinking density of the polymer network is controlled by varying the irradiation dose [6], [7].

Polysaccharide based gels have been explored for brain drug delivery and nerve regenerative engineering. Alizadeh and coworkers [8] designed biocompatible agarose/alginate/chitosan polysaccharide based hydrogels by cryo-gelation process for the treatment of neural disorder. The slow release of drug dexamethasone was occurred from the cryogels due to supramolecular interactions of drug with various pendant function groups present in the polymer matrix. Inject-able polysaccharide based hydrogels loaded with therapeutic agents have also been applied in brain drug delivery systems for various CNS ailments. The release of drugs occurred from the implant for longer period of time [9]. In a research report, memantine (drug for Alzheimer's disease) was orally administered in a rat model using chitosan based material synthesized by gamma radiation. The drug has been effectively transported to the brain and has improved the behavioral performance [10]. The release of paclitaxel from the tumor responsive tunable dextran polymeric scaffold has been reported to improve survival of rats [11]. The hydrogels protect the brain during traumatic brain injury due to their elastic nature [12]. The porous hydrogels can be used as material for neural tissue culture and can also provide support for growth of scar tissue and axonal growth during brain injury [13], [14], [15]. Chitosan and poly(vinyl alcohol) polymer matrix showed good ability to support cell viability without any significant cytotoxic effects [16].

Sterculia gum is a hydrophilic polysaccharide extracted from stem of *Sterculia urens* and composed of glucuronic, galacturonic, rhamnose and other residues. It has been applied in designing of drug delivery systems and release was occurred in controlled manner [17], [18]. Its therapeutic potential has also been reported for treatment of constipation [19], diarrhea [20], irritable bowel syndrome, and diverticulitis [21], [22]. On the other hand, alginate hydrogels promote axonal re-growth and elongation [23]. Alginate sponges filling in the gap of spinal cord injury has improved the axonal re-growth in the CNS of young adult rats and porous alginates sponges disappear within a few months after implantation [24], [25]. Alginate derived from brown algae and composed of β-D-mannuronic acid and guluronic acid [26]. Alginate-polyacrylamide hydrogels were elastic and were applied for traumatic brain injury and these gels have improved the injury [27].

The present study, an attempt has been made to design the citicoline loaded sterculia–alginate and carbopol hydrogels for use in brain drug delivery system. The citicoline has been applied as therapeutic agent during brain injury for the nerve regeneration and it has also been used other neurodegenerative diseases [28]. Its topical application has improved the functional recovery and has promoted the regeneration of injured nerves in rats [29]

Materials and methods

Sterculia gum [Sigma-Aldrich, Munich, Germany, CAS No. 9000–36-6, molecular weight 9,500,000 (app).], sodium alginate [LobaChemie Pvt. Ltd. (Mumbai, India), CAS No. 9005–38-3, MW 37–196 kDa], carbopol [LobaChemie Pvt. Ltd. (Mumbai, India), CAS No. 9003–01-4, MW 104,400 gm/mole (App], glycerol [S. D. Fine Chemical Ltd., Mumbai India, CAS No. 56–81-5,)] and Citicoline [BiosansLifecare-Kandivali, Mumbai, India] were used for the formation of drug loaded polymers.…

Synthesis of sterculia/alginate-cl-carbopol polymers

The synthesis of sterculia…

Atomic force microscopy (AFM)

The AFM average surface roughness of sterculia/alginate-cl-carbopol hydrogel film was 3.977 nm (Fig. 1). The polymer matrix could be helpful in regeneration of neural tissue. It has been reported that the surface roughness promotes the neural differentiation of human stem cells [45]. In one research report, Deligianni and coworker [46] had also showed that the surface roughness enhances adhesion, proliferation and differentiation of cell on human bone marrow.…

X-ray diffraction study

In case of X-ray spectra of gum…

Conclusions

It is concluded from the above results that composition of the sterculia/alginate-cl-carbopol hydrogel dressing has influenced the crosslinking density and swelling. The one gram of sterculia/alginate-cl-carbopol hydrogel dressing absorbed 19.60±0.35 g artificial cerebrospinal fluids. The citicoline drug release was occurred in slow manner with Fickian mechanism and was best fitted in first order kinetic model. The polymer films were found permeable to O_2 (8.33±0.1 mg/L) and H_2O…

Abstract

Keeping in view the therapeutic importance of dietary fiber azadiracta indica gum in anti-inflammatory action, in the present work, gum has been modified to develop the drug delivery carrier for methyl prednisolone used for treatment of inflammatory colonic ailments to enhance its potential. Hydrogels were formed gum polysaccharide by modified by grafting and crosslinking method. Polymers were characterized by cryo-SEM, AFM, FTIR, and ^{13}C-NMR. The cryo-SEM images confirmed the porous network structure of the hydrogels. The results showed that porosity and crosslinking density of hydrogels were influenced by the content of the monomer AAc and crosslinker NNMBA. The polymeric gels were found to have non-haemolytic (haemolytic index=3.36±1.20%), and antioxidant nature (DPPH radical scavenging=76.88±10.16%). The gel strength of the gels was 9.41±0.46Nmm. The release of methyl prednisolone was found with non-Fickian diffusion mechanism. Overall, gum based hydrogels were pH responsive and could be explored to design of colon drug delivery system for colonic ailments .

Keywords

Azadirachta indica gum; Graft copolymerization; Hydrogels; Drug delivery

1. Introduction

The azadirachta indica gum is a hydrophilic natural exudate of a plant *Azadirachta indica* that belongs to galactan gum family. It is a complex hetero-polysaccharide that contains D-glucose, D-glucuronic acid, L-arabinose, xylose, L-fucose and mannose Mukherjee & Srivastava(1955). The rheological properties of azadirachta indica gum showed that the number average molecular weight 6.4×10^5–12.0×10^5 g/mol and results also indicated Newtonian behavior of the gum solutions with intrinsic viscosity 24–36cm^3g^{-1} (Moniem,Hassan, & Osman, 2018). Azadirachta indica gum is commonly known as neem gum which has been well reported for its therapeutic potential including antioxidant, antifungal and anti-inflammatory actions. It has been used in various pharmaceutical applications such as an emulsifier, gelling agent and film forming agent (Moniem,Hassan, & Osman, 2018; Malviya,Sharma, & Dubey, 2017).

Azadirachta indica gum has been used in food and pharmaceutical formulations due to its anti-inflammatory properties (Fujiwara,etal. 1984), antitumor activity (Fujiwara, etal., 1982) and proteolytic activity (Nayak,Rao, & Pattabiraman, 1979). It has also been reported for its food packaging (Ogunjimi, & Alebiowu,2013), and drug delivery (Malviya,Sharma, & Dubey, 2018) applications. The content of the gum has influenced the flow properties of the excipients used in pharmaceutical and food applications (Ogunjimi, & Alebiowu,2013). Neem gum has also showed the proteolytic activity at wide range of pH while tested with casein and albumin substrates and gum solutions hydrolyzed casein (Nayak,Rao, & Pattabiraman, 1979). The grafting polyacrylamide on to gum has improved the release profile of the drug formulations (Malviya,Sharma, & Dubey, 2018). The ospheres of the gum formed by ionotropic gelation while applied in drug delivery has improved the mean

Typesetting math: 100%

residence time and relative bio-availability times (Vijayavani, & Vidyavathi,2018). Kulkarni,Yunus, & Dehghan(2013) synthesized azadirachta indica gum based film for controlled delivery of ciprofloxacin drug and it has been found that degradation of the film was not occurred due to sufficient mechanical strength from the coated tablet formulation. At the same time gum film has improved the moisture sensitivity of the drug.

Recently, the designing polysaccharide gum based hydrogels drug delivery carriers have been well explored along with their other biomedical applications (Shimono,Takatori, & Masumi, 2002; Jain,Gupta, & Jain, 2007; Sunetal., 2020). Polysaccharide gums generally have been applied as disintegrant, suspending agents, emulsifying agent and as binders in pharmaceutical industry (Goswami, & Naik,2014). Polysaccharide based hydrogels have been formed by modification through grafting and crosslinking (Mahdavinia,Pourjavadi, Hosseinzadeh & Zohuriaan, 2004). Addition of polyacrylic acid polymers onto polysaccharides through grafting formed pH responsive gels with improved swelling and gel strength (Chaudhuri,Mandal, Dey, & Chakrabarty, 2020). The introduction of crosslinking junctions provides mechanical stability to hydrogels during their large changes in volume (Akhtar,Hanif, & Ranjha, 2015). Some crosslinking agents become part of the final structure, whereas others can be washed out of the polymer matrix after mediating the crosslinking reactions (Duquette, & Dumont,2019). These gels are also used as sponges and bandages for the treatment of wounds (Horietal., 2019; Kumaretal., 2019). The poly(acrylic acid) based polymers are pH responsive and have been used in the colon specific delivery carriers (Li,Wu, Wang, & Duan, 2006). Huang,Yu, & Xiao(2007). have found that pH of the medium has imparted a strong influence on drug release and dissolution rate of the formulations. In the treatment of colonic ailments such as crohn disease and ulcerative colitis, administration of methyl prednisolone (MP) at a large and frequent dose for an extended period is required; therefore the specific drug delivery of MP is desired (Lautenschläger,Schmidt, & Fischer, 2014; Huanbutta,Sangnim, Limmatvapirat, Nunthanid, & Sriamornsak, 2016; Chauhan,Naruka, Rathore, & Badadwal, 2010). The polymers based drug delivery carriers prevent the dissolution of drug in the stomach until reaching the gastro- intestinal tract Friend(2005). The oral route for delivering drugs is the most effective route for colon specific drug delivery applications (Patil, & AMiji,1996). Polysaccharide based gels have capability to be used for colon-targeted drug delivery through the oral administration because of their microbial degradability in colonic environment (Madan,Gundala, Baruah, Nagaraju, & Yates, 2014; Yadav,Sand, Mishra, & Behari, 2010).

In the present work, polysaccharide Azadirachta indica gum and polyacrylic acid based hydrogels were prepared for use as colon drug delivery carrier for the slow and sustained release of a drug methyl prednisolone (MP) for the treatment of colonic ailments. These hydrogels were prepared by graft copolymerization of acrylic acid onto gum in the presence of crosslinker. MP is a synthetic corticosteroid drug mainly used as anti-inflammatory and immunosuppressive agent (Lautenschläger,Schmidt, & Fischer, 2014; Huanbutta,Sangnim, Limmatvapirat, Nunthanid, & Sriamornsak, 2016). It has been used to treat a number of different diseases such as arthritis, inflammatory bowel disease, inflammation, asthma, severe allergies, and adrenal problems.

2. Experimental

2.1. Materials and methods

Azadirachta indica gum polysaccharide [Neoteric DCBA Ideas Gandhipuram, Coimbatore, (Tamil Nadu, India)], Acrylic acid (AAc) [Merck Specialties Pvt. Ltd., Mumbai-India], Ammonium persulfate (APS) [Fischer scientific, Mumbai India], NN-methylenebisacrylamide (NNMBA) [Acros organics-New Jersey USA] and methyl prednisolone (MP) [Neon Laboratory Ltd. Mumbai India] were the materials used in the present research work.

2.2. Synthesis of Azadirachta indica-*cl*-poly(AAc) polymers

The synthesis of polymer matrix was carried out by grafting of acrylic acid onto azadirachta indica gum by chemical copolymerization method in the presence of crosslinker NNMBA. Definite concentration of gum (12% m/v) and monomer AAc (1.75 mol/L) were taken in a reaction system in the presence of definite content of initiator [APS] (2.19×10^{-2} mol/L) and [NNMBA] (0.65×10^{-2} mol/L). Then reaction content was stirred at 110 rpm with an over-head stirrer for 3 h at 25 °C. Thereafter, it was heated at 65 °C for 3 h and after washing with distilled water it was dried to get the product that was named as azadirachta indica-*cl*-poly(AAc) polymers. The polymer matrix was optimized by varying the [AAc] (from 0.58 to 2.91 mol/L) and [NNMBA] (from 0.65×10^{-2} to 7.13×10^{-2} mol/L) during the formation of polymers. The optimum conditions on the basis swelling and mechanical strength were found as azadirachta indica=12%m/v, AAc=1.75 mol/L, APS=2.19×10^{-2} mol/L and NNMBA=0.65×10^{-2} mol/L.

2.2. Characterizations

Cryo-SEM images of swelled and freeze dried polymer in liquid nitrogen at −190 °C were taken on Jeol (JSM 7600) scanning electron microscope (Japan) equipped with Quroum (UK) PP3000 t cryo attachment. AFM of dry polymer film was taken on AFM (NT-MDT, RUSSIA) in contact mode to see the average surface roughness. FTIR of dried powdered samples was taken in KBr pellets on Agilent K8002AA Carry 600 FTIR instrument. The solid state ^{13}C-NMR of dry sample of polymer was carried on BRUKER DSX-300 solid

Typesetting math: 100%

state NMR spectrometer.

2.3. Physiochemical and mechanical properties of the hydrogels

Swelling studies of the polymer sample were carried out in different media by method by gravimetric method Singh(2007). Known weight of the hydrogel was taken and immersed in excess of the solvents for different time intervals at 37°C. The hydrogels were then removed, wiped with tissue paper to remove excess of solvent and weighed immediately. Difference in the weight gave the gain in weight at different time intervals. Buffer solutions of pH 2.2 and pH 7.4 were prepared according to the procedure reported in Indian Pharmacopoeia Pharmacopoeia(1985). Buffer solution of pH 2.2 was prepared by taking 50 mL of 0.2 M KCl and 7.8 mL of 0.2N HCl in volumetric flask to make a volume of 200 mL with distilled water. Buffer solution of pH 7.4 was prepared by taking 50 mL of 0.2 M KH_2PO_4 and 39.1 mL of 0.2N NaOH in volumetric flask to make a volume of 200 mL with distilled water.

The loading and release of drug was evaluated from standard curves of the drug methylprednisolone. The methodology of loading and release was same as reported in Singh, & Singh(2017). The calibration curves for the drug methyl prednisolone were prepared in distilled water (λ_{max}=248 nm), pH 2.2 buffer (λ_{max}=248 nm) and pH 7.4 buffer (λ_{max}=249 nm) to determine the content of drug release from drug loaded polymers in different mediums. The hydrogels were allowed to swell in the drug solution of a known concentration (500 µg/ml) for 24 h at 37 °C and then were dried to obtain the drug loaded polymers. The drug loading was carried out in large number of samples by using UV Spectrophotometer at λ_{max}=248 nm and then samples of constant loading were taken for drug release studies. Diffusion of drug was evaluated by using Ritger and Peppas, 1987a, Ritger and Peppas, 1987b power law expression. The best fit kinetic model for the drug release was evaluated from different kinetics models (Shoaib,Tazeen, Merchant, & Yousuf, 2006; Dash,Murthy, Nath, & Chowdhury, 2010).

Network parameters (polymer volume fraction in the swollen state (ϕ), molecular weight between two neighbouring cross-links ($\overline{M_c}$), Flory-Huggins interaction parameter (χ), cross-link density (ρ), and mesh size (ξ) were determined by evaluating the swelling method (Singh, & Singh,2017; Bajpai, & Singh,2006; Aithal,Aminabhavi, & Cassidy, 1990). The $\overline{M}_c$ determined from Flory-Rehner equation (i).

$$\overline{M}\,c = -\mathrm{d_p}\nu_{\mathrm{m},1}\phi^{1/3}\left[\ln(1-\phi)+\phi+\chi\phi^2\right]^{-1} \quad \text{(i)}$$

Here, d_p was density of polymer,$\nu_{m.1}$ was the molar volume of the swelling agent, which is distilled water in present case. From the observed ϕ and $\overline{M}_c$values, the further cross-link density (ρ), and mesh size were calculated using equations (ii-iii).

$$\rho = \frac{dp}{(\overline{Mc})} \quad \text{(ii)}$$

$$\xi = \frac{0.071(\overline{Mc})^{1/2}}{(\phi)^{1/3}} \quad \text{(iii)}$$

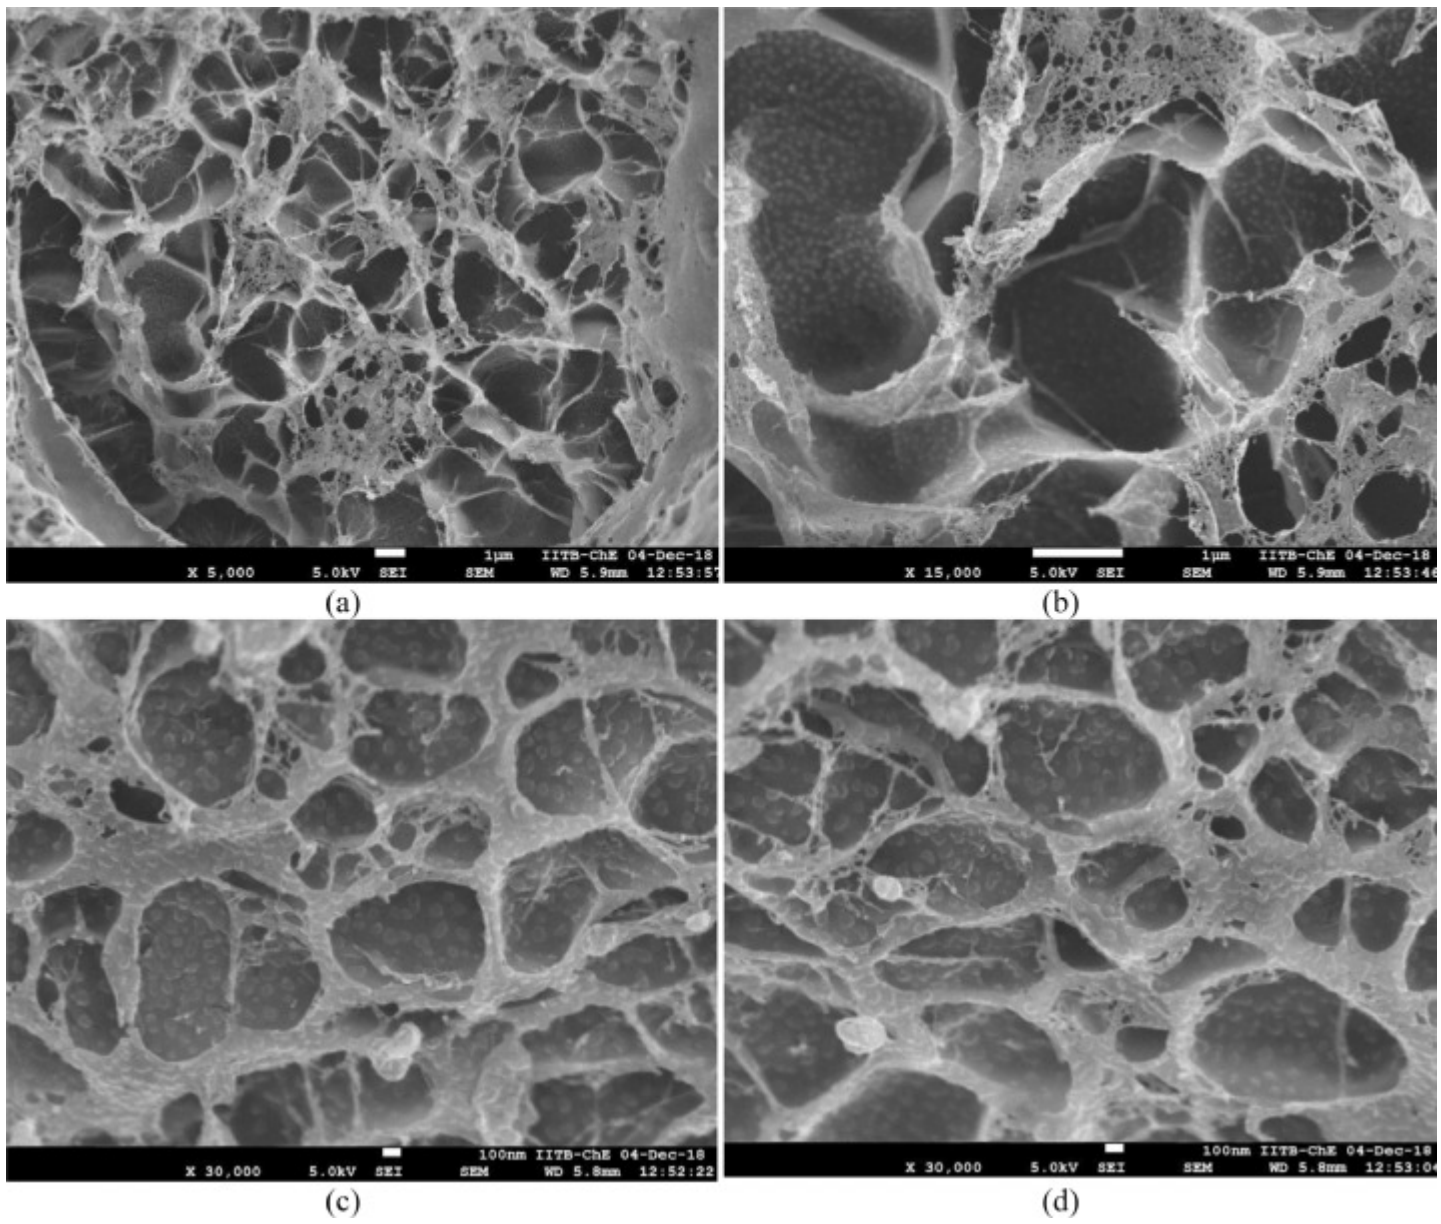
Blood compatibility of gels in terms of thrombogenicity and haemolytic potential was evaluated (Labarre,2001; dos Santosetal., 2006; Pinto etal., 2010). The evaluation of thrombus formation on polymeric surfaces was carried out by gravimetric method (Labarre,2001; dos Santosetal., 2006). Polymers of fixed weight [0.3 g] were kept in excess of PBS at 37 °C for 24 h. After that PBS was removed and 2 mL of citrated blood and 0.2 mL of 0.1 M $CaCl_2$ were placed on the surface of each polymer. The clotting process was stopped by adding distilled water (10 mL) after 45 min. Clots were fixed using 36–38% formaldehyde solution, dried and finally weighted. The positive and negative control was taken as glass beaker with absence of sample and glass beaker with absence of sample and blood respectively. The thrombose percentage (%) was calculated as follow (eqn. iv):

$$\textbf{Thrombose}(\%) = \left[\frac{\text{Mass of test sample}-\text{Mass of }(-)\text{control}}{\text{Mass of }(+)\text{control}-\text{Mass of }(-)\text{control}}\right]\times 100 \quad \text{(iv)}$$

In the case of haemolysis polymers of fixed weight (0.3 g) were placed in beaker and PBS was added. After 24 h of incubation at 37 °C, the PBS was removed and 1 mL of citrated blood was added to each sample containing fresh 7 mL PBS and maintained at 37 °C for 3 h. Positive and negative controls were prepared by adding the same amount of citrated blood to 7 mL of water and PBS, respectively. Each tube was gently inverted twice to maintain contact of the blood with the material. After incubation, each fluid was transferred to a suitable tube and centrifuged at 10^4 rpm for 15 min. The hemoglobin released by haemolysis was measured by the optical densities (OD) of the supernatants at λ_{max} 540 nm using a UV–visible spectrophotometer. The percentage of haemolytic index (%) was calculated as follows (eqn. v)

$$\textbf{Haemolytic Index} = \left[\frac{(\text{OD of sample} - \text{OD of negitive control})}{(\text{OD of positive contol} - \text{OD of negitive control})}\right]\times 100 \quad \text{(v)}$$

Mucoadhesion of hydrogels with mucosal membrane of the goat intestine was determined (Hirun,Tantishaiyakul, Sangfai, Ouiyangkul, & Li, 2019). Antioxidant activity of gels was analyzed by DPPH (2,2-diphenyl-1,5-picrylhydrazyl) radical scavenging assay and Folin-Ciocalteu (F-C) reagent assay (Gorczycaetal., 2014; Curcioetal., 2009). Gel strength was measured by using texture



Typesetting math: 100%

f the hydrogels was evaluated using an alcohol displacement method (Martinez-Ibarraetal.2019).

3. Results and discussion

3.1. Characterizations

Cryo-SEM images showed the topographic features of Azadirachta indica-*cl*-poly(AAc) hydrogels. In Cryo-SEM images, the three dimensional spherical porous network of hydrogels were observed (Fig. 1). The presence of porous network with high crosslining density can help in controlled and sustained drug delivery from the drug loaded polymers for a longer time period (Mannaetal., 2019). AFM indicated the micromechanical properties of the polymer surface (Fig.2). The three dimensional image of polymer obtained through AFM, showed the presence of some small valleys on the scanned area which indicated structural heterogeneity in the polymeric sample and presence of the roughness on the polymer surface. The root mean square roughness over an area (2×2μm) was found 8.563nm for the polymer and the average surface roughness was found to be 7.183nm (Bahrami,Bailly, & Nysten, 2019).

Fig. 2. AFM image of dry sample of hydrogel in semi-contact mode.

FTIR of gum and Azadirachta indica-*cl*-poly(AAc) polymers are shown in Fig.3. In FTIR of crosslinked polymer showed absorption bands at 3429 cm^{-1} (due to -OH stretching vibrations of the gum polysaccharide and poly(AAc)), 2933 cm^{-1} (due to -C-H stretching vibration mode of CH_2 groups), at 1729 cm^{-1} (due to C=O stretching vibration of carbonyl groups) at 1453 cm^{-1}(due to C-H deformation of methine (CH) groups in the poly(AAc),1408 cm^{-1}(due to C-H deformation of methylene (CH_2) groups in the gum and poly(AAc)), at 1248 cm^{-1} and 1043 cm^{-1} (due to C-O-C asymmetric stretching and bending vibrations (Velusamy,Das, Pachaiappan, Vaseeharan, & Pandian, 2015) Phadke etal. (Phadkeetal., 2015) showed that bands at 1600–1770 cm^{-1} were due to carbonyl (-C=O) stretching of the azadirachta indica gum . It was observed that in the range of 3500–3000 cm^{-1} there is broadening of the bands in the crosslinked polymeric structure as compared to azadirachta indica gum which indicates the crosslinking of the free hydroxyl groups in the polysaccharide gum.

Fig. 3. FTIR spectra of dry samples of (a) Azadirachta indica and (b) Azadirachta indica-*cl*-poly(AAc) hydrogels.

The ^{13}C-NMR spectra of Azadirachta indica-*cl*-poly(AAc) polymer (Fig.4) showed intense characteristic peaks at 178 ppm (due to carbonyl carbons in gum (glacturonic acid) and poly(AAc)), peaks in the range 111–98 ppm (due to anomeric carbons (C-1) linked α-1-4 and α-1-6 glycosidic linkage in the gum), peak at 79 ppm (due to C-4 in arabinofuranose in the gum), at 72 (due to C-6 in arabinofuranose in the gum), and at 63 ppm (due to C-5 in arabinofuranose in the gum). An intense band 42 ppm (due to methylene group (-**C**H$_2$)) attributed polymerization of AAc to poly(AAc). Peaks at 22 ppm and 18 ppm (due to methyl carbon (**C**H$_3$) of pyranose residues in the gum) were also observed. It has been reported in literature and Fujiwara et al. (Fujiwara et al., 1982) have examined the ^{13}C-NMR spectra of azadirachta indica gum and found that the peaks in the range 111–98 ppm was due to anomeric carbons (C-1) linked α-1-4 and α-1-6 glycosidic linkage in the gum, peak at 85–73 ppm was due to C-4 and C-3 in arabinofuranose in the gum, at 71–60 ppm were due to C-6 and C-5 in arabinofuranose in the azadirachta indica gum. Sarkar,Mandre, Panda, Pal(2013) synthesized amylopectin grafted with poly (acrylic acid) based polymer and it was observed through ^{13}C-NMR spectra that the peak around 180–170 ppm correlated to the carboxyl carbon, which is present in the spectrum of acrylic acid. In the ^{13}C-NMR spectra it was observed that upon functionalization there is an increase in the intensity of the peak at 178 ppm in the polymer due to presence of poly(AAc).

Fig. 4. ^{13}C-NMR spectra of dry samples of (a) Azadirachta indica and (b) Azadirachta indica-*cl*-poly(AAc) polymers.

3.2. Swelling studies

The effect of varying [AAc], [NNMBA], pH and temperature of medium on the swelling of the hydrogels was described in Fig.5 and Table1. The swelling firstly increased (from 2.79±0.13g/g of gel to 4.78±0.38g/g of gel) with increase in [AAc] from 0.58to1.75mol/L. Further increase of the [AAc] (from 1.75 to 2.91 mol/L) decreased the swelling (from 4.78±0.38g/g of gel to 2.37±0.52g/g of gel) of the hydrogels. The water sorption of the hydrogel was due to formation of the hydrophilic polymeric chains network wherein the higher crosslinking density at higher monomer concentration was responsible for the decrease in swelling Nesrinne, & Djamel(2017). The results of swelling of hydrogels formed with varying [NNMBA] indicated the decrease in swelling (from 6.56±0.28g/g of gel to 3.89±0.20g/g of gel) with increase in [NNMBA] from (0.65×10^{-2} to 7.13×10^{-2}mol/L). This may be due to increases in extent of cross linking with increase in crosslinker during the polymerization process. The results of influence of nature of swelling medium and temperature indicated higher swelling of the polymer matrix at higher pH and temperature. This may be due to ionic repulsion of the constituted ions (-COO^{-}) after partial hydrolysis of the polymer at higher pH values (Risbud, & Bhonde,2000). The enhancement in water uptake by gels with rise in temperature of swelling medium was due to increase in polymer chains mobility. The swelling behaviour of the hydrogel at various pH mainly depends on the ionized pendant carboxylic groups and the electrostatic repulsive forces in the hydrogel. The degree of ionization strongly influences swelling and hydrophilicity of the polymers (Sun,Wang, Jing, & Mohanathas, 2013).

3.3. Determination of network parameters of the hydrogels

The results of network parameters of Azadirachta indica-*cl*-poly(AAc) polymers are given in Table2. The effect of [AAc] on network parameters shows that $\overline{M}_c$ and ξ increased (from 28804g/mol to 87604g/mol and 20.47nm to 31.90nm) firstly and then decreased (from 87604g/mol to 8734.0g/mol and 31.90nm to 10.46nm) with increase in [AAc] (from 0.58 to 2.91mol/L) during the formation of the hydrogels. While crosslink density ρ firstly decreased (from 3.83×10^5 to 0.71×10^5mol/cm^3) and then increased (from 0.71×10^5mol/cm^3 to 13.18×10^5mol/cm^3). These trends of various network parameters were described on the basis of swelling results. It was observed that with increase in swelling of the gels the mesh size ξ increased and vice versa. While opposite trends of crosslinking density ρ was observed. The increase in crsslinker content [NNMBA] during the formation of the hydrogels decreased $\overline{M}_c$ and ξ (from 78528 to 8386.5g/mol and 38.82nm to 10.47nm) respectively. While ρ increased (from 1.24×10^{-5} to 9.63×10^{-5}mol/cm^3). This may be due to increase in crosslinking and decrease in swelling of the hydrogels with increase in [NNMBA]. Both, pH and temperature of the swelling medium influenced the network parameters. The molecular weight between two crosslinks and mesh size was found higher at higher pH and temperature. During network parameter evaluation some irregular trends were observed. This may be due to simultaneous increase in hydrophilicity of the gum-polyacrylic acid gels and increase in crosslinking of the gels with change in monomer concentration. The lower value of crosslink was also reported by Xue,Champ, & Huglin(2001) in case of acrylic acid based hydrogels where small change in value has been observed with change in crosslinker concentration. Overall, it was inferred from these results that monomer and crosslinker content and pH of swelling medium has influenced the mesh size and crosslinking density of the hydrogels.

Table 2. The network parameters of Azadiracta indica-*cl*-poly(AAc) hydrogel as a function of different parameters.

3.4. Blood compatibility

The results of the thrombogenicity and haemolytic index value for Azadirachta indica-*cl*-poly(AAc) hydrogels are given in Table4. The thrombose percentage was observed 80.8±4.64% for Azadirachta indica gum hydrogels. These results indicated that these hydrogels can be classified as non-thrombogenic materials and could be explored for forming the colon specific drug delivery systems. The haemolysis value of the material was observed 3.36±1.20% which is less than 5% and the polymer has been considered as safe (according to ISO document 10993-32002) for use in biomedical applications (Guptaetal., 2019).

3.5. Antioxidant activity

The results of the antioxidant activity of the polymers obtained from Folin-Ciocalteu (F-C) reagent assay showed that hydrogels showed antioxidant activity that was equivalent to 24.86±3.83 µg gallic acid hydrogels. The DPPH radical scavenging assay for the hydrogels at different time intervals (12h) showed 76.88±10.16% scavenging for hydrogels (Table4). Antioxidant materials scavenge excess of free radicals and protect the body from oxidative degradation. Polysaccharide based biopolymers were reported highly antioxidant due to presence of various free radical scavengers (Afinjuomoetal.2019). The hydrogels in the present studies were synthesized by using azadirachta indica gum (1.7×10^{-4}mol/L), AAc=1.75mol/L, APS=2.19×10^{-2}mol/L and NNMBA=0.65×10^{-2}mol/L.

3.6. Mucoadhesion

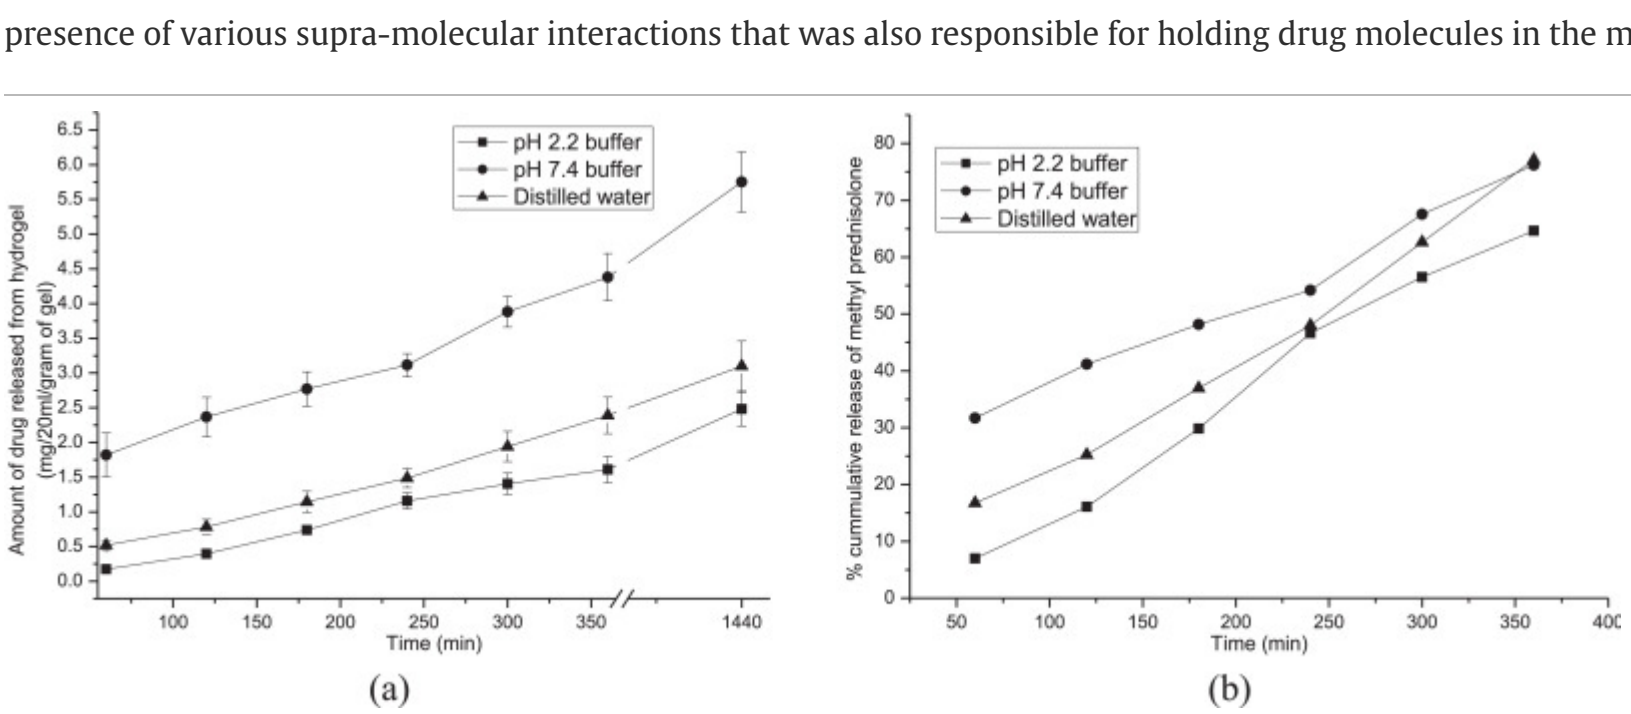
Mucoadhesion results of Azadirachta indica gum based hydrogels with intestinal mucus membrane in terms of peak detachment force (*Fmax*) and work of adhesion given in Table4. The F_{max} and work of adhesion values were 0.105±0.025 N, and 0.567±0.417 Nsec, respectively. Hydrogels were found to be mucoadhesive in nature. Bioadhesion in the drug delivery carrier has improved the performance of the drug delivery system by extending the mean residence time of colon (Reddy,Holbrook, Gizurarson, & Kristmundsdottir, 2019). It is also advantageous for site specific drug delivery. It is found that the mucosa can rise the residence time of the drug delivery device at the site of captivation in the body which in turn results in the sustained action of the nonspecific drugs to the target sites (Liangetal., 2019). Duanetal.(2016) have designed the chitosan- alginate based mucoadhesive hydrogels for colonic drug delivery for the treatment of inflamed colon.

3.7. Mechanical strength

Effect of [AAc] on gel strength was determined and gel strength of hydrogels first decreased (from 19.08±2.14Nmm to 11.31±1.61Nmm) then increased (from 11.31±1.61Nmm to 19.19±2.46Nmm) with increase in [AAc] . On the other hand, with increase in crosslinker content the mechanical strength of the hydrogels enhanced (from 09.41±0.46Nmm to 27.61±1.03Nmm) e mechanical strength of the gel decreased at higher pH and temperature of the medium due to higher swelling

Typesetting math: 100%

of the hydrogels (Table4). As swelling increased gel strength decreased and vice versa. The higher swelling causes loosening of the polymeric network, that results in decrease in gel strength of the polymer matrix (Kumarasamy, & Giri,2019). It has been found that crosslinking in polysaccharide has improved the stability and mechanical strength of the hydrogels. The drug released of longer period from the hydrogel formulation for longer time and polymer matrix did not release drug immediately during their journey to colon (Das, & Subuddhi,2013).



The nature of the monomer also influenced the physiochemical and mechanical properties of the hydrogels. The gel strength was found higher (9.41±0.46Nmm) in Azadirachta indica -poly(AAc) based hydrogels as compared to Azadirachta indica - poly(AAm) based hydrogels (2.79±0.24Nmm). The grafted and crosslinked product formed by the grafting of polyacrylic acid onto Azadirachta indica gum showed higher free radical scavenging ability as compared to the grafted product formed by the polyacrylamide. In acrylamide based hydrogels it has been observed 49.24±8.57%, while DPPH radical scavenging ability of Azadirachta indica -poly(AAc) hydrogels was found to be 76.88±10.16% (Singh,Mohan, & Singh, 2020).

3.8. Porosity

Porosity measurement helps in studying internal pore morphology which in turn determines the drug absorption and drug release properties of the hydrogel matrix. For Azadirachta indica-*cl*-poly(AAc) hydrogel matrix showed values of porosity 5.93%. Polymers with smaller pore sizes can holds drug molecules for longer period of time, making Azadirachta indica-*cl*-poly(AAc) a suitable candidate for drug delivery applications. Siangsanoh,Ummartyotin, Sathirakul, Rojanapanthu, & Treesuppharat(2018) observed that porosity of the hydrogels largely affects the drug release patterns from the drug loaded hydrogels. It helps in release of drug in controlled manner for a longer period of time. Saraydın,Karadag, Işıkver, Şahiner, & Güven(2004) observed that concentration of crosslinker influenced the swelling behaviour of the polymeric hydrogels due to change in the porosity of the of the hydrogel network. The increase in concentrations of the cross linkers leads to decrease in the swelling of the polymeric hydrogels due to increase in extent of cross linking and decrease in the porosity of the hydrogel. The stability of the hydrogels is an important characteristic of ideal biomedical materials. The low stability of the hydrogels limit their use in biomedical applications including drug delivery and appropriate stability aids in controlled and sustained drug delivery (Huang etal., 2011).

3.9. Drug loading and release studies

The release profile of methyl prednisolone from the drug loaded Azadirachta indica-*cl*-poly(AAc) polymers was determined in pH 2.2 buffer, distilled water and pH 7.4 buffer solutions (Fig.6 and Table3). The release of drug from the drug containing polymer was found more in pH 7.4 buffer (61.36±7.53%) as compared to the pH 2.2 buffer (22.01±1.31%). These results were inferred from the higher swelling abilities of the polymer matrix in pH 7.4 buffers as compared to other mediums. The higher swelling was due to increase in mesh size due to ionic repulsion of the ions formed in the polymer matrix in pH 7.4 buffer solution (Baietal., 2018). This led to release of higher drug content from the polymer matrix into the solutions. Similar observation has been made by Sun etal. (Sun,Wang, Jing, & Mohanathas, 2013) in case of hemicelluloses and polyacrylic acid based drug delivery system. Seeli, & Prabaharan(2017) designed gum grafted polymethacrylic acid based colon specific drug delivery system for ibuprofen. The higher degree of drug release was found in intestinal pH medium. The several drugs loaded hydrogels were prepared and for each release medium hydrogels of constant loading were taken. The drug loading of methyl prednisolone into polymeric hydrogels was observed 65.02±4.11%. The porous nature of the polymer allowed slow release of drug from the drug delivery carrier due the presence of various supra-molecular interactions that was also responsible for holding drug molecules in the matrix.

ertinent to mention here that there exist different intermolecular interactions, like electrostatic, dipole-dipole

interaction and hydrogen bonds, between dug and polyacrylic acid /polysaccharides which are also responsible for make it suitable candidate for pharmaceutical preparations particularly in slow the drug delivery systems (Huang,Yu, & Xiao, 2007). The values of diffusion exponent (n) indicated non-Fickian diffusion mechanism for methyl prednisolone release from the polymer matrix solutions and release profile of the methyl prednisolone from polymer matrix was best fitted Korsmeyer-Peppas model.

Wangetal.(2016) synthesized chitosan-based colon targeted drug delivery device for the treatment of inflammatory bowel disease. The results of the study showed that polymer released a high amount of 65.6% drug in stimulated colonic fluid as compared to gastric fluid with enhanced bioavailability of the drug in the colon makes it suitable for colon drug delivery applications. Similar observations have been made by Youetal.(2015) for the cumulative release of drug from xanthan gum based hydrogel prepared for colonic drug delivery applications. The results of the study showed that 70 % drug release occurred within 4h.

Keeping in view the variety of pH within the digestive system, in the present work release profile of the drug MP was carried out in pH 2.2 and 7.4 buffer. In general, pH in the stomach acidic in nature, ranges from 1.5 to 3.5 and increases to 5.5–6.8 in the small intestine. The pH is 6.4 in the ascending colon, rises in the transverse colon, and approaches neutrality (pH 7.0) in the descending colon Scheline(1973). Fig.6 a indicated the release profile of drug and Fig.6b showed cumulative release of drug from Azadirachta indica-*cl*-poly(AAc) hydrogels. The material prepared from the gum-polyacrylic acid based hydrogel was explored for its potential for drug delivery applications to treat inflammatory colonic diseases after release of methyl prednisolone drug from the loaded hydrogels. The poly(acrylic acid) based polymers have been reported as pH responsive and have been used in the colon specific delivery carriers (Li,Wu, Wang, & Duan, 2006). The swelling and release of drug in this medium was carried out to find the pH responsive nature of the hydrogels. The higher swelling at pH 7.4 was found due to ionic repulsions of the ions formed at higher pH solution that indicated the pH responsive behavior of the materials.

The drug delivery carrier based on gum polysaccharide will degrade in the GIT. Polysaccharide metabolism has a great importance in the large intestine due to presence of vast majority of saccharolytic microorganisms in the gastrointestinal tract. On the basis of substrate available, chemical structures and compositions as well as the biochemical characteristics and catabolite regulatory mechanisms different bacterial species participate in degradation of the polymer matrix which including hydrolysis, depolymerization and fermentation of the substrates (Macfarlane & Macfarlane,1997). This leads to release of entrapped drug molecules from the polymer matrix. The gum polysaccharide-based drug delivery carriers are generally degraded to smaller absorbable molecules. At the same time, it is important to make sure that the monomers are non-toxic in nature. In the present case the polymer matrix is gum-polyacrylic acid which is known to be biodegradable, biocompatible and non-toxic. Drug delivery carrier for colon drug delivery system firstly, need to be remained intact when traveling through the upper GI tract in order to protect the incorporated drugs from chemical and enzymatic degradation. Secondly, they should be able to release the incorporated drugs upon reaching the colon segment of the lower gastrointestinal tract. Furthermore, the released drugs need to be absorbed at an efficient rate in the gastrointestinal tract in order to be therapeutically effective (Sinha & Kumria,2001).

4. Conclusions

It is concluded from the above results that porosity and crosslinking density of Azadirachta indica-*cl*-poly(AAc) hydrogels were influenced by the content of the monomer AAc and crosslinker NNMBA. This observation was also inferred from the swelling trends of the hydrogels. The release of methyl prednisolone was found with non-Fickian diffusion mechanism and release was best fitted with Korsmeyer-Peppas model. The polymeric gels were found to have non-haemolytic (haemolytic index=3.36±1.20%), and antioxidant nature (DPPH radical scavenging=76.88±10.16%). The gel strength of the gels after swelling was 9.41±0.46Nmm. Azadirachta indica gum based hydrogels were pH responsive and could be explored to design effective colon specific drug delivery. Overall, the slow release of methyl prednisolone from the neem gum based hydrogels will reduce the side effects of the conventional formulation and enhance the therapeutic potential of the drug for methyl prednisolone for colonic inflammatory ailments.

Abstract

Background: Polysaccharide based gastro-retentive drug delivery systems (GRDDSs) can retain in the gastric fluid of stomach for a longer time and release the entrapped drug in a controlled and localized manner, which can ensure optimal drug concentration at the site of action with improved bioavailability and reduced side effects of acid-suppressive drugs like ranitidine.

Objective: The objective of the present study was to design smart polymers for gastro-retentive drug delivery of ranitidine through ionic-gelation of carboxymethyl cellulose (CMC) and sodium alginate (ALG).

Methods: The optimal reaction conditions for the synthesis of beads were evaluated by varying reaction parameters during synthesis and were obtained as CMC = 1.5% (w/v), ALG = 0.5% (w/v) and CaCl2= 0.1 M with maximum equilibrium swelling ratio (2922.50 ± 0.90)%. The drug loading was carried out by simultaneous and swelling equilibrium methods. Beads were characterized by SEM, PXRD, FTIR, TGA, bead size and swelling studies.

Results: Increase in Ca2+ ions and ALG concentration resulted in a decrease in swelling capacity and an increase in bead size. Beads got collapsed in phosphate buffer solution and swelling occurred through the non-Fickian diffusion mechanism. Floating beads with (51.05 ± 0.25)% entrapment efficiency for the simultaneous drug loading method exhibited the Fickian diffusion mechanism and best fitted in the Higuchi model. The diffusion coefficient and initial rate of drug release in simulated gastric fluid demonstrated swelling controlled gastro-retentive release of ranitidine.

Conclusion: These smart polymeric beads have the potential to use as a promising candidate for the design of GRDDSs for the treatment of gastric ulceration and gastro-oesophageal reflux disease.

Keywords: Fickian diffusion, floating beads, ranitidine, smart polymers, stomach specific drug delivery, GRDDSs.

Abstract

In the present work, choline based ionic liquid, Cholinium ethanoate ([Chl][Eth]) has been synthesized and various thermophysical parameters for glycine and L-alanine in synthesized choline based IL have been calculated from density (ρ) and speed of sound (u) values at different concentrations and temperatures (288.15–318.15) K by keeping an interval of 10K. Hepler constant is used to predict the structure maker/breaker behavior of solute in aqueous IL. The interaction coefficients have also been determined using the transfer volumes. To validate the results obtained from thermodynamic parameters, FT-IR spectroscopy has been carried out. The theoretical and experimental results were used to deduce the interactions present in the present ternary systems and effect of temperature and alkyl chain length on the measured parameters has also been discussed.

Graphical abstract

Interactions between aliphatic amino acids (Glycine and L-alanine) with IL (Cholinium ethanoate).

Introduction

Ionic liquids are grasping the attention of researchers from last few decades as they are proved to be promising substitutes of the customary solvents and have excellent properties such as thermal stability and low vapor pressure but in many studies few of the solvents of this class have been proved toxic, carrying antimicrobial influence on the environment along with the adverse effects on the flora and fauna [1], [2]. Therefore, the claim that ILs are green solvents should be carefully evaluated and considered from an environmental perspective. Ionic liquids having well-recognized imidazolium, pyridinium to phosphonium, pyrrolidium, ammonium, cholinium and, sulphonium cation with a variety of anions have ample applications in catalysis, electrochemistry, carbohydrate chemistry, enhance oil recovery, drug delivery, surface-active agents as well as in pharmaceutical, biomedical and

Typesetting math: 100%

cosmetic industry [3], [4], [5], [6], [7], [8]. Ionic liquids are organic molecules with large cations and small anions having the significant feature of tailoring their properties by varying the anion [9]. Ionic liquids possess chemical stability, low melting point, high ionic conductivity, solubility, negligible volatility, flame retardacy, moderate viscosity, and high polarity. Looking at their remarkable properties it is not irrational to label ionic liquids as 'Solvents of future' [10], [11], [12]. Ionic liquids undergo intermolecular interactions with polar substances including biomolecules, solubilizes them as the former hold mutual electrostatic interaction as well as repulsion of charged moieties that assist in solubilization. Though ionic liquids are potential candidates in various fields but recent toxicological studies show that not all ionic liquids are non-toxic and biodegradable [13], [14]. Usually, ionic liquids with halogen as anion are toxic and are harmful to biological systems and our environment. Hence, biocompatible ionic liquids that have ions derived from natural products must be used instead of recklessly used toxic ionic liquids. Choline cation based ionic liquids have been found notably biodegradable and environmentally benign. Choline is a quaternary ammonium salt and is generally associated with counter ions (hydroxide, chloride, and tartrate). In 1998, the National Academy of Sciences (NAS) enlisted choline in the list of human vitamins as a nutrient (vitamin B). Rogers Sheldon E-Factor for Choline chloride approaches zero as waste products are not produced during its synthesis [15]. Choline acts as a precursor molecule for acetylcholine that is a neurotransmitter that aids in muscle control. Choline cation is present in two classes of phospholipids namely phosphatidylcholine and sphingomyelin that are existent in cell membranes. Because of their miscibility with organic solvents/water and designability choline based ionic liquids are used in organic synthesis, organic reactions, deep eutectic solvents (DES), biomass conversion, and anti-cancer agents. Currently, Choline-based ionic liquids are used in new drug delivery systems [16], [17], [18]. The Cholinium cation can be combined with alkanoate anions to form novel choline based ionic liquids [19]. Cholinium based ionic liquids intensify the structural stability and biological activity of proteins [20], [21]. Since proteins have complex structures, therefore amino acids referred to as building blocks of proteins are studied intensively for understanding the denaturation of proteins, their hydration, and aggregation. Understanding of the interactions among ILs and amino acids will assist in optimizing pharmaceutical procedures besides operations in bio-tech industries where ILs are known to be consumed as solvents [22], [23]. Thermodynamics along with supplementary microscopic studies of amino acids with choline based ILs can convey indispensable information about the interactions present between various constituents in a ternary mixture [24], [25]. Considering this, the present study is an attempt to analyze various thermodynamic and acoustic parameters which have been carried out for glycine and L-alanine in aqueous Cholinium ethanoate [Chl][Eth] [m_{IL} = (0.01, 0.03 and 0.05) mol.kg^{-1}] at atmospheric pressure and varying the temperatures. Various parameters like partial and apparent volumes, transfer volumes, interaction coefficients (pair and triplet) have been used to explain the various interactions present and consequence of alkyl chain length of amino acids on the solvation behavior. Further, the inferences made by thermodynamic studies have also been confirmed using FTIR spectroscopy.

Section snippets

Chemicals

Specifications of all the chemicals used in carrying out the experimental work are mentioned in Table 1. Prior to use, Glycine and L-alanine were dried in a vacuum and also stored over P_2O_5 in a vacuum desiccator for 2 days. The ionic liquid [Chl][Eth] was synthesized in the laboratory from ethanoic acid (mass fraction purity≥0.99) and choline hydroxide (with purity of 46 wt% in H_2O) are purchased from Sigma Aldrich. All the procured chemicals are used as such without any further purification.…

Results and discussion

In this work, the densities (ρ) of amino acids (glycine and L-alanine) have been measured in m_{IL} = (0.01, 0.03 and 0.05) mol.kg^{-1} of aqueous [Chl][Eth] at concentrations of amino acids ranging from (0.05 to 0.30) mol.kg^{-1} and experimental temperatures (T=288.15 K–318.15 K) with interval of 10 K. The experimental density values of the system studied have been listed in Table 2. The data of density of other choline based ionic liquids (choline alkanoates) is provided in Table 2 [26]. As the…

Conclusion

For the amino acids (glycine and L-alanine), the density and speed of sound data have been measured in aqueous ([Chl][Eth]) solutions. Various parameters including partial molar volume and apparent molar volumes have been calculated to infer the type of interactions present in the ternary systems. From the results obtained for V_ϕ and V_ϕ^0 it can be concluded that the solute–solvent interactions are prevalent in the systems under study. From transfer volumes, it has been determined that…

Abstract

The protein-surfactant interactions have been investigated for a long time due to their increased effectiveness in cleanliness and industrial processes. Moreover, Covid-19 outbreak has revolutionized the significance of protein-surfactant interactions, as soaps were proved the best cleansers and safe during this period. In this review article, an overview of physico-chemical aspects of protein-surfactant interactions along with various techniques has been discussed. In addition, the effect of different factors such as co-solvent, temperature, pH, chain length of surfactants, salt, and their impact on critical micelle concentration (CMC) of surfactant, structure, binding, thermodynamic parameters, and stability was also explained. This review will help the scientific community in understanding how to improve the effectiveness and applications of proteins and surfactants in pharmaceutical and other industries as protein-surfactant interactions can explain the significant phenomena of hydrophobic and electrostatic interactions.

Introduction

Protein-surfactant interactions have been studied for a long time. Anson [1] was the first scientist who introduces this important topic into spotlight and found out that denaturation of proteins is done by surfactants at a very lower concentration than that of chemical denaturants like urea. An increased interest in this topic can be assigned to the accessibility of new experimental methods to study the protein-surfactant interactions and their implementation results in formulation of detergents, food emulsion, pharmaceutical, cosmetic products, etc. In addition, this topic plays an important role in other fields like protein-surfactant absorption at interface [2] as well as in relatively complex biological phenomena especially in biological membrane [3], [4].

In the eighteenth century, Antoine Fourcroy and others identified proteins as a group of well-defined molecules, which have the

capability to coagulate and flocculate in the presence of heat or acid. Proteins are the unique molecules that play an important part in each one of the biological processes occurring in living creatures [5]. Their behavior may be influenced by their interactions with the nearby region. To assimilate the function of protein in living organisms [6], it is important to investigate the thermodynamics of the native structure of protein [7]. Proteins are the naturally occurring polypeptides that consist of α-amino acids arranged in chains or in a folded form. There are two types of conformations shown by proteins i.e. native conformation and random coil conformation. The main difference between native and random coil conformation is that in native conformation; chain-chain contact is thermodynamically favored whereas in random coil conformation; chain solvent contact is thermodynamically favored. Generally, various intermolecular forces are liable for maintaining the structure and conformation of proteins, which include hydrophobic, ionic, electrostatic, and van der Waals forces of interactions. Disulphide bond is also responsible for the conformation of proteins. The amount of the free energy that maintains the native structure of a protein is about 9–17 kcal Mol^{-1} and this energy is easily controlled by minor perturbation in the surrounding components like temperature, pH, pressure, ligand, surface charge density, and hydrophobicity. All these components can disturb the various types of interactive forces that are responsible for protein stability [8]. Denaturation of proteins in the aqueous medium is an elemental biological phenomenon, which is not fully understood and remains a subject of boundless analysis [9]. To identify the impact of various denaturing agents on proteins, it is very necessary to recognize the interactions of these additives with proteins in aqueous medium [10]. The individual interaction of water with several functional groups present on the protein leads to the development of the stable folded structure of proteins in aqueous medium [11]. The commonly used proteins for physico-chemical studies include bovine serum albumin (BSA) and lysozyme.

In 1929, Kurt von Neergaard started the tale of a surfactant when he filled a porcine lung with an isotonic gum solution to abolish surface tension of the air tissue interfaces [12]. Surfactants are the surface-active agents, which consist of polar hydrophilic head (lipophobic) and non-polar hydrophobic tail (lipophilic) i.e. they are amphiphilic in nature [13]. Because of the presence of hydrophilic group, surfactants are soluble in aqueous medium. It is the hydrocarbon tail of the surfactant, which is responsible for its biodegradability. Surfactants are considered as the compounds that are responsible for adjusting the surface and interfacial tension [14]. Some important properties like critical micelle concentration (CMC), charge, hydrophile-lypophile balance (HLB), aggregation number and chemical structure make them good emulsifying, dispersing, and foaming agent [15], [16], [17].

In aqueous medium, surfactants behave as monomers, but at critical micelle concentration (CMC), they combine spontaneously to form micelle, and this phenomenon is known as micellization [18]. Development of micelle occurs due to the dual nature of surfactant molecule due to which hydrophilic head remains emerged in water, whereas hydrophobic tail remains away from water, so the monomer concentration remains essentially constant and approximately equal to the CMC [19], [20], [21]. Micelle is divided into three regions (Fig. 1) i.e., outer region, palisade region, and the core [22].

Surfactants are classified into two main types based on their head groups, whether they are charged or neutral. Charged surfactants include cationic and anionic; neutral surfactants include non-ionic and zwitter-ionic [23] (Fig. 2).

Cationic surfactants contain a positively charged head group; anionic surfactants contain a negatively charged head group as a result of which these are ionizable in water. Non-ionic surfactants are non-ionizable in water because of the lack of charge in their head groups whereas zwitter-ionic surfactants contain both positively and negatively charged head groups. The most commonly used surfactants include cetrimide (cationic), ethers of fatty alcohols (nonionic), and N-alkyl betaines (amphoteric) (Table 1, Table 2, Table 3, Table 4).

Surfactants have been used as detergents and cleansing agents for a very long time. The physico-chemical characteristics of a detergent enable it to use in many forms, mainly in powdered and liquid form. The main function of all the cleaning agents is to remove the greasy substance from any surface to make it clean and shiny. This process occurs due to the presence of a polar hydrophilic head and a non-polar hydrophobic tail, which allows the formation of a bridge between water and grease. The greasy stuff is trapped by the hydrophobic part whereas hydrophilic part remains emerged in water due to this dispersion occurs which results in the formation of an oil-in-water emulsion. In this form, it can be rinsed off by water. Out of different types of surfactants, anionic surfactants are used as wetting agents, whereas cationic surfactants are used in hair products. Cationic surfactants are considered as fabric softeners. Non-ionic surfactants are used in different types of cleaning agents such as in shampoo, hand wash, lotion and so on. Amphoteric surfactants are used in various skincare products and acid metal cleaners [24], [25], [26]. Surfactants are also used for bioremediation. Bioremediation is a process in which microorganisms act as transformers in the presence of surfactants. Sodium dodecyl sulfate has been used for enhancing the bioremediation rate of hexavalent chromium in the presence of sugar cane bagasse [27]. Surfactants have been used in drug delivery systems where they act as carriers or vehicles for various hydrophobic drugs. Hydrophobically modified dextrans have been used in this process because of their biodegradable nature [28]. Dendrimer–surfactant aggregates play an important role in acting as carriers for different hydrophobic drugs like the antibacterial drug sulfamethoxazole (SMZ). Span (20,40) and Tween (20,40) surfactants are also considered as drug carriers [29], [30].

Surfactants are also responsible for the modification of some important phenomena such as disintegration and diffusion of drugs.

Furthermore, surfactant also plays an important role during transportation of drugs across membranes. Recently, a new surfactant called as novel based bola surfactant is identified which has been used as drug carriers for tumor cells [31]. Surfactants have been used in various oxidative transformations where the micelle plays an important role in identifying the reaction rates. The enhancement of micelle-based transformation occurs because of some collision frequencies among micelle. The interactions between a surfactant and activated complex are responsible for various micellar catalysis. Surfactants have been used as a catalyst in many organic reactions in aqueous medium in to restrict the usage of various organic solvents [32].

Recently, a new class of surfactant called bio-surfactants have been introduced which are commercially used because of their ecofriendly nature and easy availability. They are categorized as low mass (glycolipids, lipolipids) and high mass (polymeric surfactants). They may be neutral as well as anionic. Low mass surfactants are responsible for decreasing the interfacial tension because of which they are used as emulsifiers. High mass surfactants include proteins that show molecular interactions with lipids up to certain degrees. They show a wide range of applications in the food industry, where they act as antimicrobials and emulsifiers (polysaccharides). One of the most important example of bio-surfactants, which have been used in food and pharmacy, is rhamnolipids obtained from P. aeruginosa [33], [34]. Besides this, surfactants have been used in paints and coatings where they serve as dispersants (polyacrylates), wetting agents (sulfosuccinates), and defoamers (metal soaps) [35]. Because of their increasing usage, much attention should be paid towards the production of low-cost and eco-friendly surfactants. The chemistry behind the application of surfactants is widely spread, which needs further research to unveil those properties which enable their usage in various new fields.

Protein-surfactant interactions

The analysis and knowledge of protein-surfactant interactions play a considerable part in improving the effectiveness and application of proteins in pharmaceutical and other industries because surfactants may increase the physico-chemical properties of proteins [36], [37], [38], [39], [40], [41]. Moreover, it plays a significant role in explaining the process of hydrophobic-electrostatic interactions [42]. The hydrophobic effect causes protein folding [43], [44], [45], [46] whereas the…

Techniques used for studying protein-surfactant interactions (Table 5)

Abstract

In this experimental work, values of density and speed of sound of some α–amino acids viz.; glycine, L-alanine, L-valine and L-leucine with different molal concentrations of IL; 1-Butyl-3-propylimidazolium bromide ([BPim][Br]) at four working temperatures and experimental pressure p=0.1 MPa have been determined. Using the corresponding data, different thermo physical parameters like apparent molar volume (V_ϕ), partial molar volume (V_ϕ^0), standard partial molar volume of transfer (ΔV_ϕ^0), apparent molar isentropic compression ($K_{\phi,s}$), partial molar isentropic compression ($K_{\phi,s}^0$) and partial molar isentropic compression of transfer ($\Delta K_{\phi,s}^0$) have been calculated. Interaction coefficients have been determined using McMillan–Mayer theory and IR spectral studies have also been performed to validate the results obtained. The structural behaviour of all the α–amino acids (α-AAs) under consideration in ([BPim][Br]) and various types of interactions occurring in the ternary systems have been predicted from the results of various parameters.

Introduction

Proteins are highly composite molecules present in all living organisms. Proteins are the biomolecules that are vital for human life. They are the building blocks of living beings and play a significant role in the body of living beings [1]. Proteins participate in DNA replication, transcription, catalysis, assists in digestion and acts as messenger to transmit signals so as to synchronize biological activity among various cells, tissues and organs [2]. Also, proteins are being used in making fibers. These constructs are promising in tissue engineering and wound healing applications due to their biocompatibility and biodegradability [3], [4]. Proteins are biomaterials as well as bio catalysts having plenty of assists while considering the challenges occurring worldwide as it assists in minimalizing the environmental effects along with evolving a circular economy [5], [6]. Chemically, proteins are composed of

amino acids that are the building blocks of these versatile macromolecules [7]. The interactions of these complex biomolecules with the adjacent environment affect their conformational characteristics. These interactions exist among the solvent ions and the protein molecules [8], [9]. The chemistry, stabilization and destabilization of proteins is greatly effectuated by the some of the additives [10]. To utilize these biocompatible scaffolds efficiently, knowledge about their structure and interactions with its surrounding is essential but due to their complex structure, it turns out to be quite challenging. Hence their monomeric subunits, the amino acids, are being studied intensively. Solvation of the molecules is necessary for many biological processes that result in the volume change. The protein's conformational stability depends on the different interactions present among the amino acids and the functional groups of the solvents in which they are being dissolved [11], [12]. The α-amino acids have an amine and carboxylic functional groups along with an alkyl side chain and alteration in the alkyl group number in the side chain influences the thermo physical properties of amino acid significantly. The study of thermophysical and transport properties of amino acids in solvents helps in understanding the presence of various types of interactions as well as conformational stability of proteins in that particular solvent [13], [14], [15].

Looking at the impacts of conventional solvents on the environment there is a need for eco-friendly solvents that can replace the traditional solvents efficiently. Ionic liquids turned out to be promising alternatives in the field of amino acids, carbohydrate chemistry, solution thermodynamics, electrochemistry, polyelectrolytes, colloid and surfaces and pharmaceuticals. Ionic liquids due to their unique properties like tailoring its structure by varying anion or cation, low melting points, high viscosity, thermal stability, miscibility with water, and negligible vapor pressure have an ample number of uses [16], [17], [18], [19], [20]. In order to design the ILs as per our requirement, it is necessary to have a deep knowledge of their thermodynamic and physicochemical properties, with the additives. ILs also possess mutual electrostatic interaction and repulsion of charged particles due to which they can solubilize polar substances [21], [22]. Considerate knowledge of the interactions of the ILs with α-amino acids would benefit in optimizing the various pharmaceutical processes and operations in bio-tech industries r [23], [24]. A thorough insight of the phase behaviour of the components in a mixture (amino acid+water+IL) is crucial for understanding of the molecular mechanisms in order to govern extractions from a particular media as well as a bioreaction process where ILs can be utilized as solvents. Thermodynamics besides complementary microscopic data for aqueous ILs solutions are thus indispensable information source, especially for systems comprising of sugars, fermentation metabolites, salts, amino acids and enzymes. Generally amino acids exist in the biological media in aqueous phase and influence the mutual solubility of IL and water. In the present study, investigation of molecular mechanisms underlying the behaviour of the ionic liquid (1-butyl-3-propylimidazolium bromide) when AAs are present and further discussion of the influence of the chemical structure of these bio molecules on the interactions established by them with the species present in the solution. The system under investigation is focused on gaining information about solvation behaviour of amino acids that in turn influence the activity, stabilization and recovery of biomolecules in these solvents [25].

Although interactions of ILs with the amino acids are being studied extensively and the data reported earlier mainly deals with the measurement of thermodynamic and acoustic parameters of amino acids in aqueous solution of imidazolium based ILs containing $-CH_3$ at position 1 and effect of variation of number of alkyl groups at position 3 of the imidazolium cation [26], [27]. In the present study, the number of alkyl groups at position 1 are also increased along with that of position 3 and various interactions occurring between the ternary systems containing aqueous solutions of the synthesized IL ([BPim][Br]) (molality (mIL) = (0.01, 0.03 and 0.05) mol kg^{-1}) and α-amino acids (glycine, L-alanine, L-valine and L-leucine) have been determined at various temperatures and atmospheric pressure.

1-Butyl-3-propylimidazolium bromide used in the present study, was synthesized in the laboratory. 1-Butylimidazole (Sigma Aldrich, mass fraction purity 0.99) and 1-Bromopropane (Sigma Aldrich, mass fraction purity 0.99) were used to synthesize ([BPim][Br]).), acetonitrile (Loba Chemie Pvt.Ltd.) and ethyl acetate (Loba Chemie Pvt.Ltd. were also used in the synthesis of ([BPim][Br]). The α–amino acids (HIMEDIA Laboratories Pvt. Ltd. India, mass fraction purity 0.99.) were desiccated and kept over …

Density and speed of sound data

The density (ρ) and speed of sound (u) values of α-AAs (glycine, L-alanine, L-valine and L-leucine) are measured in different molal concentration (0.01, 0.03 and 0.05) mol·kg^{-1} of aqueous solutions of ([BPim][Br]) at various temperatures are listed in Table 2. From analysis of density and speed of sound data it is evident that the values of density increase as the concentration of AAs and the ionic liquid increases whereas it decreases with rise in temperature. The speed of sound values…

Conclusion

Densities and speed of sounds of glycine, L-alanine, L-valine and L-leucine were obtained in 0.01, 0.03 and 0.05 mol/kg aqueous solution of ([BPim][Br]) at four equidistant temperatures. Based on the various thermophysical parameters calculated using the density and speed of sound data, several types of interactions have been predicted present in the ternary systems (AA+IL+water). The positive values of V_ϕ and the negative values of $K_{\phi,s}$ indicate the presence of solute–solvent interactions…

WOMEN'S PARTICIPATION IN PANCHAYATI RAJ INSTITUTIONS: A PERSPECTIVE FROM JAMMU REGION IN JAMMU AND KASHMIR

Ashwani Kumar

ABSTRACT

Men dominated Panchayati Raj Institutions until the 73rd Amendment of 1993, which mandated 33 percent reservation to women. The provisions of the 73rd Amendment were available to women in Jammu and Kashmir from 2003, owing to its limited constitutional autonomy under Article 370. This reservation provided an opportunity to a large number of women from the state to participate in the panchayat elections in 2011. This article studies the awareness level and participation of the newly elected women panchayat members in Panchayati Raj Institutions. The author also studies the socioeconomic, political and socio-cultural factors that impact women panchayat members in carrying out their regular activities.

Psycho Social Issues of Tobacco Marketing: An Observational Study at Point of purchase

Dr. VineyDhiman, Dr. AnupamaBharti

Abstract

Background of the Study: Tobacco is at the centre of the contradictions inherent in the evolving process of globalization. It is where the goals of a set of multinationals are clearly in conflict with public health and welfare and where globalization of values such as accountability and corporate responsibility are under severe pressure. The transformation of marketing and promotion of harmful commodities, such as tobacco products, is one important component of globalized public health threats. The industry looks towards the creation of new brands, products and variety in the market. Today's youth is attracted to such a flavored product which is dressed up with brightly colors and attractive packing. Given the harmful influence of tobacco advertising and promotion on current, potential, and former smokers, marketing regulation is a necessary component in the effort to combat the global tobacco epidemic. Objectives: The current research work provides a general review of emerging promotional channels, such as packaging, viral marketing. Secondly to analyzed the violation under smoke free act (COTPA, 2003) by these promotional approaches. Methodology:Study Areas:This survey was conducted in two cities of Punjab state namely Bathinda and jalandhar city Study Design: The research used descriptive research design in the study. Method of data collection: Observation and interview technique were used for the data collection. Observations like display of advertisement, variety of smoked and smokeless tobacco products and use of any promotion were noted. The information was collected from tobacco vendors based on convenient sampling.These included temporary kiosk, permanent kiosk and permanent shops. These observations were noted according to the various sections like 7, 8 and 9 of Cigarettes and Other Tobacco Products (Prohibition of Advertisement and Regulation of Trade and Commerce, Production, Supply and Distribution) Act, 2003. Results: The results of the present study illustrate that cigarette &bidi packs and smokeless tobacco products were carried out the flavored properties, with catching tag lines, attractive packaging and lastly dull warning images on the packs of both segments, advertised at point of purchase locally. Number of flavored, foreign, Indian brand and locally manufactured cigarettes packs were available and sold at point of purchase. These products with attractive packing packages attract the young population and these approaches leads to lifetime addiction and affected with tobacco related diseases.

IMPACT OF FOLK MEDIA ON RURAL DEVELOPMENT

Dr. Vikas Dogra*
Mr. Krishan Gopal Thakur**

ABSTRACT

In this paper an attempt has been made to critically analgise the role of traditional media on rural development. Folk media is one of the vehicles for social change and nation building. The present paper examines the role of folk media in the present scenario. Traditional Folk Media is a term used to denote 'people's performances'. It describes folk dance, rural drama and musical variety of the village people. This term speaks of those performing arts which are cultural symbols of a people. Traditional folk media are personal forms of communication and entertainment. These forms of art are a part of the way of life of a community and provide acceptable means of bringing development issues into the community on its own terms. Therefore, we need to keep our traditional media alive by continuously and cautiously safeguarding and preserving from the adverse effects of globalization. This paper will discuss the use of folk media, either in their traditional rural settings or when adapted to mass media to bring about social awareness of government development plans.

Keywords : Folk Media, Rural Development, Awareness and Rural Drama.

Introduction

Traditional media are of various kinds and vary from place to place, culture to culture and region to region, but in all these forms the purpose remains the same, that is to inform, educate and entertain the audiences for generating awareness among them about various development issues, including health and family welfare, rural development, agriculture, social aspects etc. Different methods of traditional media are predominantly used in different parts of the country according to the pulse of the audiences. India is a treasure-house of people's performing arts. Conventionally the traditional folk performances have been theme-carriers, usually carrying themes of morality. They have served as night schools in rural areas. Among the rural performances the flexible ones like the puppet play and katha-kirtan have shown their capacity to absorb any modern message and reflect it in terms that are easily understood by the village masses. Several song types have handled vital contemporary themes like the green revolution, scientific temperament, eradication of illiteracy and superstition, family welfare, health and sanitation. When handled with care and consideration, the folk media have proved themselves to be meaningful and effective tools of communication and development. During the past four or five decades, they have slowly acquired a functional dimension without losing their cultural roots. After the freedom struggle National Government started a full-fledged Song and Drama Division in 1954, with the objective of identifying, training and utilising the services of traditional folk performers to inform the rural masses about the planning and development programmes of the country. A decade later, the Amarnath Vidyalankar Committee, which was appointed to assess the communication potential of different information media, recorded that, 'From the point of view of its great appeal to the masses and its quality of touching the deepest emotions of the illiterate
